INDEX TO SUBJECTS

JANUARY TO DECEMBER, 1918

INDEX TO AUTHORS

- Alacan, Jose P.,
Diaz, Jose Guillermo, Sketch, 229
- Apple, Franklin M.,
Elixirs of the National Formulary, Discussion of, 348
Preceptor—An Asset or a Liability, 50
Profiteering of the Landlord, 616
- Army, H. V.,
Advance by Kilometers, 1052
Bigelow, Clarence Otis, Sketch, 663
Metric System in the Household, 280
Pharmaceutical Bodies, Federation of, 587
Proposed Research Institute, 1027
- Axelrad, Sol.,
Wool Fat (Lanolin) Substitute and Preparation of Cetyl Alcohol, 29
- Ballard, C. W.,
Malted Milk, Microanalysis of, 326
Wild Anthemis—a Possible Matricaria Adulterant, 952
- Bartheu, Charles L.,
Ampoules, Manufacture of, 613
- Beal, J. H.,
Address, House of Delegates, 450
- Beard, J. G.,
Continuous Percolation under Reduced Pressure—Report No. 1, 964
- Beath, O. A.,
The Seasonable Variation of Acidity, Toxicity, and Alkaloidal Content of Three Species of Larkspur, 955
- Becker, Irwin A.,
Dakin's Solution, a Report on, 971
- Beringer, George M.,
Elixirs of the National Formulary, Discussion of, 347
- Bodemann, Wilhelm,
Chicago Veteran Druggists' Association, 448
- Bonisteil, William J.,
Paraffin Films and Oil Dressings, 355
- Bradley, Theodore J.,
American Conference of Pharmaceutical Faculties, Summary of Proceedings of 1918 Meeting of, 799
- Briggs, C. H.,
Problems of the Manufacturing Pharmacist, Due to War Conditions, 1047
- Cain, Frank, M. D.,
The Need of Qualified Pharmaceutical Service for the American Soldiers in the U. S. Army, 722
- Carter, Frank H.,
Pharmacy, Historical or Early, in Indianapolis, 881
- Christensen, H. C.,
National Association Boards of Pharmacy, Summary of Proceedings of Fifteenth Annual Meeting at Chicago, Aug. 12-13, 1918, 801
- Clevenger, Joseph F.,
Commercial Viburnum Barks and Preparations, 944, 1059
Eupatorium Glutinosum Lam., an Adulterant of Matico, N. F. (Piper Angustifolium Ruiz et Pavon), 510
Piptostegia Root, Piptostegia Mart., So-Called "Brazilian Jalap," 855
So-Called Syrian Alkanet, Macrotomia Cephalotes, D. C., 591
- Colson, H. C., Jr.,
Fluidextract of Squill, 940
Standardization, Biological, of Heart Tonic Preparations, 13
- Cook, E. Fullerton,
Pharmacy Colleges, Business Training in, 880
- Cooper, Zada M.,
Teaching the Public, 177
Editorial—School, "Plugging," the Menace of, 847
- Cousins, W. H.,
The State Legislature, 629
- Creighton, Mary L.,
Beal, Dr. James Hartlev, Sketch, 115
Chemistry of the Household, 179
- Davis, W. W.,
Powdered Ipecac, Standard for, 1055
- Day, William B.,
Editorial—Will Pharmacy Find Herself? 119
See Reports in Subject Index
- Diner, Jacob,
Magnesium Sulphate, 150
- Dohme, A. R. L.,
Address to Members of American Pharmaceutical Association at Chicago Meeting, 665
Conservation in Pharmacy, 790
Editorial—Medicine, Pharmacy and Chemistry, 117
- Eberle, E. G.,
See Editorials and Editorial Notes
Ebert, Albert Ethelbert, Sketch, 753
Edmonds, Geo. W., Sketch, 409
Fuller, Oliver Franklin, Sketch, 843
Henry, Samuel Clements, Sketch, 319
Kraemer, Henry, Sketch, 581
LaWall, Charles Herbert, Sketch, 7
McKesson, John, Jr., Sketch, 933
Porterfield, Wm. Perry, Sketch, 499
Squibb, Edward Robinson, Sketch, 1023
- England, J. W.,
Elixirs of the National Formulary, Discussion of, 348
Pharmacy an "Essential Specialty" of Army Medical Practice, 756
Wanted—the Old-Fashioned Pharmacist, 610
- Ewins, Clare Olin,
Commercial Viburnum Barks and Preparations, 944, 1059
Eupatorium Glutinosum Lam., an Adulterant of Matico, N. F. (Piper Angustifolium Ruiz et Pavon), 510
Karaya Gum, a Substitute for Tragacanth, 787
Piptostegia Root, Piptostegia Mart., So-Called "Brazilian Jalap," 855
So-called Syrian Alkanet, Macrotomia Cephalotes, D. C., 591
- Fairchild, Samuel W.,
Letter re Fairchild Scholarship, 1069
- Fantus, Bernard,
Tablets for Disinfection of Drinking Water, 1034
Tolu and Sugar Coating in the Disguising of Medicines, 249
- Farwell, Oliver Atkins,
Brazilian Jalap and Some Allied Drugs, 852
- Fennel, C. T. P.,
Pharmacy American, 365
- Fredericks, F. H.,
Report, Chairman on Model Pharmacy Law Committee, 1105
- Fuller, Dr. H. C.,
Cannabis, the Possibility of Substituting for Opium, 431
Drug Culture, Symposium on, 133
Drug Farming, Scientific, 125
- Gay, St. Claire R.,
Carrel-Dakin Solution, Pharmaceutically and Physiologically Considered, 258
- Geisinger, J. F., M. D.,
Kidney Stones, Phosphatic, Solubility of, 337
- Gershenfeld, Louis,
Bacteriology, Its Relation to Pharmacy and Allied Sciences, 605
- Graham, R. I.,
Fluidextract of Squill, 940
- Grever, E. V.,
Kidney Stones, Phosphatic, Solubility of, 337
- Gregory, Willis G.,
Pharmacy, Entrance Requirements to, 870
- Griffith, Ivor,
Prescription Clinic. Showing Some Incompatible and Some Unusual Prescriptions, 359
- Hackh, Ingo W. D.,
Evolution of Chemical Symbols, 1038
- Hamilton, Herbert C.,
Cannabis Sativa and Its Extracts, Stability of, 333
Digitalis Extracts, Deterioration of, 433
Effect of Alcohol on Pituitary Extract, 1030
- Harer, C. R.,
Alcohol, Estimation of, 594
- Harris, H. L.,
Borax and Boric Acid, 858
- Hensel, Samuel T.,
Saccharin, Use of as a Sugar Substitute, 607
- Holzhauser, Charles W.,
A Square Peg in a Round Hole, 874

- Horn, D. W.,
Catalysis, 364
- Howell, E. V.,
Soy Beans and Soy Bean Oil, 159
- Hunsberger, Ambrose,
Drug Conservation, Practical, 349
- Hurty, J. N., M. D.,
Drug Store Recollections, 625
- Hynson, H. P.,
Modern Drug Store Advertising, 716
- Jones, Mrs. D. F.,
How Pharmacists' Wives May Be of Service to Their Country, 719
- Jones, Ernest R.,
Hydrogenated Oils as Future Ointment Vehicles, 525
- Jordan, C. B.,
Address, Chairman Section on Education and Legislation, 1060
- Kehler, Lyman F.,
Report, Chairman Committee on U. S. P., 1104
- Konantz, W. A.,
Para-Dichlorobenzene, Some Possible Pharmaceutical Uses of, 341
- Krauss, Robert B.,
Dichloramin T. and Chlorinated Eucalyptol 1-2, Preparation of, 46
- Kremers, Edward,
Drug Culture, Symposium on, 130
Graduate Instruction in Pharmacy, 76
Heptane Solution, Chemistry of, 343
Ginseng, Lafitau's Memoirs on, 448
The Apothecary—a Literary Study. The Two Sons of a Danish Apothecary, Hans Christian Oersted and Anders Sandoe Oersted, 620
- Kuever, R. A.,
Pharmacy, Women in, To-day, 52
- LaWall, Charles H.,
Bolshevism in Pharmacy, 1085
Elixirs of the National Formulary, Discussion of, 347
Prescription Clinic, Showing Some Incompatible and Some Unusual Prescriptions, 359
- Lee, Charles O.,
Datura, Microchemistry of the Alkaloids of, 504
- Liggett, Louis K.,
Merchandizing, Modern, 712
- Lilly, J. K.,
Manufacturing Pharmacy in Indiana, the Development of, 541
- Lindly, J. M.,
Iowa's Prerequisite Law, 172
- Linton, Arthur W.,
Colleges of Pharmacy—Are They Devoting Sufficient Time to Dispensing? 263
- Lloyd, J. U.,
Drug Culture, Symposium on, 134
Pharmacy, Solvents in, 137
Remington, Joseph Price, Sketch, 3
- Lyman, R. A.,
Drug Culture, Symposium on, 134
- Lyons, A. B.,
Alkali Salts of Organic Acids, Rapid General Assay Method for, 603
Caffeine-Sodio-Benzozate, Official Standard for, 1029
Calomel Assay (U. S. P.), Improved, 939
Water Drops and Water Droplets, 524
- Mansbach, M. A.,
Frasch, Herman, 163
Sulphur, American, 163
- Maske, Wm. Jr.,
Assaying, Alkaloidal, a New Method of Extracting Drugs for, 339
Opium, Improved Lime Method for Assaying, 248
- Miller, F. A.,
Drug Plant Cultivation, Breeding, 124
- Mueller, Bertha,
Glycerin, Comments and Suggestions on Its Use in Official Preparations, 869
- Mueller, N. R.,
Henbane, Cultivation of, 127
- Mulford, H. K.,
Editorial—Drug Plant Cultivation, Importance in United States, 9
- Mulford, H. K., Jr.,
Digitalis, Deterioration of U. S. P. and "Fat-free" Tinctures, 236
- Murray, B. L.,
Problems of Manufacturer of Medicinal Chemicals, Resulting from War Conditions, 1042
Transportation Drugs by Mail, 1110
- Nelson, C. Ferdinand,
School and Pharmacy and the Profession, 81
- Niece, Frederic E.,
Laboratory, the Chemical. Side Lights in Its Making, 704
- Peacock, Bertha L. Deg.,
Zinc Chloride, Some Observations on the Dissolving of, and Several Suggested Solvents, 689
- Peacock, Josiah C.,
Address, Chairman Section on Practical Pharmacy and Dispensing, 959
Advertising Pharmacy to Pharmacists, 1056
Zinc Chloride, Some Observations on the Dissolving of, 689
- Pittenger, Paul S.,
Apparatus, Improved, for Testing Activity of Drugs on the Isolated Uterus, 512
Deterioration Tincture of Digitalis, 1033
Digitalis, Deterioration of U. S. P. and "Fat-free" Tinctures, 236
Liquor Hypophysis, Effect of Alcohol on, 851
- Plette, G. W. Lloyd,
Sugar, Inversion of, in U. S. P. Syrup, 609
- Pritchard, B. E.,
Pharmacy, Three Cardinal Points in, 793
- Raubenheimer, Otto,
Drug Store Experience before Entering College, 170
Mercury, the History of, 445
Window Display, Moving, 261
- Rogers, Charles H.,
Resins from Datura Metelloides, Chemical Investigation of, 26
- Rovin, Alex. M.,
Vaccine Therapy in the Light of Facts, 427
- Rowat, R. M.,
Casarea Sagrada, Analysis of Liquid and Aromatic Extracts of, and the Introduction of a Manganese Number for the Same, 759
- Rudd, W. F.,
Kidney Stones, Phosphatic, the Solubility of, 337
Report, Secretary Section on Education and Legislation, 1065
- Rusby, H. H.,
Poisonous and Medicinal Properties in Unknown Plants, Recognition of at Sight, 770
What Shall We Teach? 1071
- Sayre, L. E.,
Drug Culture, Symposium on, 136
Pharmacists, Military Recognition of, 442
Pharmacy, Degree in, What Is the Meaning of? 700
- Schaefer, Hugo H.,
Nux Vomica and Its Preparations, Variation in, 687
Conservation of Crude Drugs, 1049
- Schulz, Henry L.,
Acid, Acetylsalicylic, and Adulterants, Analysis of, 33
- Seoville, Wilbur L.,
Jalap, Brazilian, 785
- Shelford, Victor E.,
Drugs, Habit-Forming, Reactions of Goldfish to Certain of These—the Use of the Gradient Tank, 577
- Shepardson, F. W.,
Administration Pharmacy Problems in Illinois, 1076
- Smith, F. A. Upsher,
Formula, War Emergency for Soda Fountain Syrup, 354
- Snyder, J. P.,
Carbon Tetrachloride as a Solvent for Fats, 966
- Solmann, Torald,
Epinephrin in Hypodermic Tablets, Estimates of Minute Quantities, 435
Silver Compounds, Organic and Colloidal, Distinctive Properties and Classification, 677, 992

Rabies (Hydrophobia), 416
- Stewart, Francis Edward,
Pharmacology and the Recognition of Professional Pharmacy by U. S. Government, 436
Report, Chairman Committee Patents and Trade Marks, 1067
- Stockberger, W. W.,
Address to Scientific Section, 848
Drug Culture, Symposium on, 128, 136
- Stofer, R. C.,
Drug Trade—What It Has Done to Win the War, 528
- Stroup, Freeman P.,
Chemistry, Theory of, a Practical Method for Teaching It, 864

- Sturmer, J. W.,
Test, the Acid, 589
- Thompson, H. L.,
Logarithms and Antilogarithms—the Use of in
Pharmaceutical Assaying, 972
Percentage Solutions and Alligation, 1089
- Viehoever, Arno,
Commercial Viburnum Barks and Preparations,
944, 1059
- Walker, R. H.,
Remington, Joseph P., Letter to Editor regarding,
379
- Westman, L. E.,
Cascara Sagrada, Analysis of Liquid and Aromatic
Extracts of, and the Introduction of a Manganese
Number for the Same, 759
- White, Robert C.,
Aspirin Tablets, the Manufacture of, 697
- White, William R.,
Ferric Citro-Chloride, Color Changes in Solutions
of, 255
- Wimmer, Curt P.,
Pharmaceutical War Babies, 967
Substitutes, Emergency, for Sugar, Syrup and
Glycerin, 39
- Wood, Horatio, C., Jr., M.D.,
Elixirs of the National Formulary, 344
- Woodruff, Chas. M.,
Pharmacy, a Temple of, Forecast, 380
- Wulling, Frederick J.,
Pharmaceutical Standards, More Consistent, 795
Pharmacy, Commercial, So-Called, Should Not Be
Taught in Our Colleges of Pharmacy, 872
- Zeumer, E. P. (In error C. T. P. Fennel's name was
given)
Antitoxins and Serums, Manufacture, Preparation
and Uses, 184, 288
- Zufall, C. J.,
Castela Nicholsoni, Histology of, 166

INDEX TO SUBJECTS

A

- Acer spicatum*, substitution as "cramp bark" for *viturnum opulus*, Arno Viehoever, Clare Olin Ewing and Jos. F. Clevenger, 944
- Acetylsalicylic acid and adulterants, analysis of, H. L. Schulz, 33
- Acids,
acetylsalicylic acid and adulterants, analysis of, H. L. Schulz, 33
boric, increasing its solubility by means of sodium borate, 832
boric, and borax, H. I. Harris, 858
- Acids,
organic, rapid general assay method for alkali salts of, A. B. Lyons, 603
sulphonic, 47
see also committee reports on drug market, U. S. P. and N. F.
- Aconite,
and its preparations, present method for assay unsatisfactory, 528
- Act,
of Toronto, for prevention of venereal disease, 749
see also law and legislation
- Address,
Beal, J. H., chairman House of Delegates, 450
Dohme, A. R. L., president A. Ph. A., 665
Dulbis, W. L., chairman Section of Historical Pharmacy, 532
Jordan, C. B., chairman Section on Education and Legislation, 1000
Pearcock, J. C., chairman Section on Practical Pharmacy and Dispensing, 959
Stockberger, W. W., chairman Scientific Section, 818
- Address, changes of, 110, 223, 315, 401, 493, 574, 657, 750, 838, 929, 1018
- Addresses, see minutes of Association and Sections
- Adulterant,
of Mateo, N. F., *Eupatorium glutinosum* Lam. (*Uper anastifolium* Ruiz et Pavon), Clare Olin Ewing, 510
see also drugs and chemicals, committee reports on drug market
- Advance by kilometers, H. V. Arny, 1052
- Advertising,
keep it up—message to the manufacturer, 921
of modern drug store, H. P. Hanson, 716
medical, standards for, 68
medicine—package plan for investigation, 69
pharmacy to pharmacists, 1056
- Albany, 678
- Alcohol,
barbitic, 56
ethylic, preparations of, Sol. Axelrad, 29
and distilled liquors, etc., sale, 837
effect on pituitary extract, Herbert C. Hamilton, 1030
estimation of, C. R. Harer, 594
ethyl, reactions of goldfish to Victor E. Shelford, 601
floor tax held to be illegal, 313
law of Colorado, 55
effect on liquor hypophysis, Paul S. Pittenger, 851
- Alkali salts,
of organic acids, rapid general assay method for, A. B. Lyons, 603
see also committee reports on drug market, U. S. P. and N. F.
- Alkaloids,
of *datura*, microchemistry of, Charles G. Lee, 504
see also name of alkaloid, report of committees on U. S. P. and drug market
- Alkanet,
so-called Syrian, macrotonia cephalotes, D. C. Clare Olin Ewing and Jos. F. Clevenger, 591
- Alligation,
and percentage solutions, H. L. Thompson, 1089
- Amendment,
to By-Laws, American Pharmaceutical Association, 805
on combination dues, 883, 909
to Harrison Law, proposed, 837
to Regulations, U. S. Public Health Service, 738
see also law and legislation
- Americanization,
of former enemy-owned concerns, 997
- American Pharmaceutical Association,
buttons and pins, appropriation for, 91, 97
candidates for President, 844
Chicago convention, registration list, 833
Chicago meeting, 488, 569, 584, 653, 664, 745, 754, 833
federation plan, tentative, prepared by President A. R. L. Dohme, 488
funds of, A. R. L. Dohme, 668
certain funds to be invested in Liberty Bonds, 1004
membership prizes for Missouri pharmacists, 632
minutes of general sessions, Chicago, 804, 883
model pharmacy law, partial draft of, 387
officers, election of, for 1918-19, 1006
officers, election of, for 1919-20, 1024
official roster for 1917-1918, 639
president-elect, C. H. LaWall, 7
reorganization of, A. R. L. Dohme, 117
secretary's report, 890
time of meeting, 1918, 100, 190
treasurer's report for year 1917, 474
treasurer, word from, 53
Wilkes-Barre branch, establishment of, 826, 992
- Amputees,
filling of, 613
manufacture of, Charles L. Barthen, 613
- Anaesthesia,
magnesium sulphate for use in, Jacob Diner, 150
- Analysis,
acetylsalicylic acid and adulterants, H. L. Schulz, 33
see also assay and determination and report committee on drug market
- Anthemis,
wild—a possible matricaria adulterant, C. W. Ballard, 952
- Anti-narcotic legislation,
resolution on, 311
- Antitoxins and serums,
manufacture, preparation and uses, E. P. Zeumer, 184, 288
(In error C. T. P. Fennel's name was given)
- Apocynaceae,
or do-bane family, H. H. Rusby, 779
- Apothecary, The,
a literary study—Hans Christian Oersted and Anders Sandoe Oersted, Edward Kremers, 620
- Apparatus,
improved, for testing the activity of drugs on the isolated uterus, Paul S. Pittenger, 512
- Appropriation,
for dues in American Metric Association, 1004
emergency, for salaries of officers, Council A. Ph. A., 1009
for Joint Comm. on Revised Nomenclature of Cultivated Plants, 1004
to Committee on Syllabus, 1004
- Argyrol, 678
- Aristolochiaceae,
or snake root family, H. H. Rusby, 775
- Army of five million men,
medical department of, 394
- Army Training Corps, Students', 825
- Arsenic compounds, organic, toxicity of, 1010
insecticide industry, 84
- Asium, acute poisoning from 5 grains of, 1010
tablets, manufacture of, Robert C. White, 697
- Assay,
aconite and its preparations, present chemical method unsatisfactory, R. C. Stofor, 528
alkali salts of organic acids, rapid general method for, A. B. Lyons, 603
cadmate U. S. P., improved, A. B. Lyons, 939
digitidin and digitilis, 15
opium, Wm. Maske, Jr., 248
see also analysis and determination and committee reports on drug market, U. S. P. and N. F.
- Assaying,
alkaloidal, a new method of extracting drugs for, Wm. Maske, Jr., 339
pharmaceutical, use of logarithms and antilogarithms in, H. L. Thompson, 972
- Assays,
biological, H. C. Colson, Jr., 13
Dakin's solution, 972
digitalin, 15
digitilis, 17, 22, 434
drugs, crude, 736
on abain, 16, 17, 23, 24
- Association,
American Drug Manufacturers', 220, 310
reorganized War Service Commission, 569

- American Medical, sixty-ninth annual meeting of, 653
- American Metric, 106, 217
- appropriation for dues in, 1004
- meeting of, 991
- membership dues in, 91
- Arkansas Association of Pharmacists, officers 1918-19, 570
- Baltimore Drug Exchange, 107
- Chicago Veteran Druggists', Wilhelm Bodemann, 448
- memorial meeting for Frederick M. Schmidt, 927
- federated pharmaceutical, A. Ph. A., 811
- The Manufacturing Perfumers' of U. S., officers of, 569
- Missouri Pharmaceutical, a critical period in its history at hand, H. M. Whelpley, 570
- National Boards of Pharmacy, 65
- officers and committeemen, 836
- summary of proceedings, 801, 1068
- National Drug Clerks, officers 1918-19, 655
- National, manufacturers of fruit and flavoring syrups, organization of, 492
- National Pharmaceutical Service, 106, 217, 746
- Edmonds' Bill, letter urging cooperation, 836
- mobilization of pharmaceutical forces, letter from Jos. Jacobs, 473
- Ohio Branch, 219
- officers, election of, 654
- National Retail Druggists, 106
- annual convention, 745
- twentieth annual meeting of, 836, 923
- officers, election of, 925
- pledge of cooperation with U. S. Public Health Service, 924
- recommendations of Executive Committee, 924
- National Wholesale Druggists',
- forty-fourth annual meeting, 925
- Federal Trade Commission charges "conspiracy," 746
- report of delegates of A. Ph. A., 1002
- New York Drug Trade Section of Board of Trade and Transportation, 220
- Philadelphia Drug Exchange, 220
- Proprietary, of America, officers of, 569
- Rotary Clubs, International, resolutions in interest of Pharmaceutical Corps, 739
- Associations—State Pharmaceutical, officers of 1918-19, 653, 747
- meetings of, 492, 570, 654
- Connecticut, 747
- Delaware, 747
- Florida, 747
- Georgia, 747
- Idaho, 747
- Indiana, 748
- Iowa, 176, 748
- Louisiana, 571
- Maine, 748
- Massachusetts, 748
- Michigan, 748
- New Jersey, 748
- New York, 748
- Oklahoma, 571
- Pennsylvania, 748
- Texas, 571
- Utah, 748
- West Virginia, 748
- Wisconsin, 748
- Atropine and hyoscyamine, 504, 507
- Australian Medical Corps,
- pharmacy department of, 486
- B**
- Bacteriology,
- relation to pharmacy and allied sciences, Louis Gershenfeld, 605
- Beal, James H.,
- appointed member of Advisory Board on Medicinal Products to Medical Section, War Industries Board, 923
- endorsed for place on Advisory Commission, 103
- sketch, Mary L. Creighton, 115
- Belladonna leaves,
- symposium on "What the Drug Trade has done to win the war," 528
- Berberis,
- and its allies, H. H. Rusby, 777
- Bigelow, Clarence Otis,
- sketch of, H. V. Army, 663
- Bill,
- Edmonds', hearing on, 306, 398
- propaganda, 567, 836
- resolution on, 313
- Whitney, to become a law in New York, 492
- Biological Assay Methods, H. C. Colson, Jr., 13
- see also Assays, Biological
- Biological standardization,
- heart tonic preparations, H. C. Colson, Jr., 13
- Boards of Pharmacy,
- examinations of, 1065
- Pennsylvania gives notice of changes in state drug law, 108
- see Associations
- Book Notices and Reviews,
- American Drug Manufacturers' Association, proceedings of seventh annual meeting of, 1020
- Chemical Laboratory of the A. M. A., annual reports for 1917, 659
- Biologic products, the nature of contaminations of, Ida A. Bengston, 1020
- Everyman's Chemistry, Hendrick, 111
- Drugs, actions of, Sollmann, 224
- Ether, its effect on tetanus spores and other micro-organisms, H. B. Corbitt, 1020
- Latin, elementary lessons in, Wall, 225
- National Wholesale Druggists' Association, proceedings of, 576
- Pharmaceutical Botany, Heber W. Youngken, 749
- Practical Pharmacy for pharmacists and physicians, Birdsey L. Maltbie, 577
- Practice of Pharmacy, Remington, 225
- Principles of general pharmacy and chemistry, Chas. T. P. Fennel, 495

JOSEPH P. REMINGTON

JOSEPH PRICE REMINGTON, Ph.M.

Born Philadelphia March 26, 1847—Deceased January 1, 1918.

Joined the American Pharmaceutical Association in 1867; elected president in 1892; succeeded Dr. Charles Rice (deceased) in 1901 as Chairman of the Revision Committee of the United States Pharmacopoeia, and elected to the same office for the Ninth Revision. Presided at the Seventh International Pharmaceutical Congress in 1893, represented the United States at the Eighth Convention in Brussels, 1896. Presided over the Section on Pharmaceutical Chemistry at the International Congress of Chemistry, 1912. Dean of the Philadelphia College of Pharmacy since 1893; succeeded William Procter, Jr., as Professor of Pharmacy in 1874.

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL. VII

JANUARY, 1918

NO. 1

JOSEPH P. REMINGTON.*

I have been informed that Professor Remington is very low, and that possibly we may never have the opportunity of another visit together. One may be excused, in a case like this, for addressing a mutual friend, even though the subject be painful to both, and thus I take the privilege of writing you, who, now resident in the city home of Professor Remington, as editor of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, will be in affiliating sympathy with persons like myself, afar off.

These many years ago Professor Remington and I met first in Indianapolis, Ind., at the meeting of the American Pharmaceutical Association, 1879. Professor Remington was then in the vigor of his early manhood. I studied him as a hero, because even at that date his magnificent services to pharmacy had led everyone to consider him as perhaps the most conspicuous incoming American engaged in pure pharmacy in all its outreaches. A professor in the Philadelphia College of Pharmacy; a successful conductor of a drug store in the city of Philadelphia; schooled as he had been with such men as Procter, Parrish and Maisch, with the practical experience that came from personal effort under that Nestor of American pharmacy, Dr. Edw. R. Squibb, in whose laboratory Professor Remington, close to Squibb, served an apprenticeship,—this, too, years after he began his apprenticeship opportunity with the established house of Charles Ellis Sons & Co., of Philadelphia. One can but comprehend that to the present writer the chance, to one whose opportunities had not been great, of meeting this celebrated pharmacist, was an epoch, an event.

May this writer not add that possibly but for Professor Remington he might not himself have been long in the service of pharmacy? Remington it was who championed his cause in a personal way at Indianapolis, even volunteering, and reading, the paper prepared by the writer for that occasion, "On the Conditions Necessary to Successfully Conduct Percolation."

Close together have we been since that date, each serving in the field of pharmaceutical opportunity, these fields often seemingly separated, and yet united as a whole. In my praise of Remington, I voice what seems sure to me to be the sentiment of thousands of pharmacists who, in separated sections of the country, have been in close touch with this leader of us all, Professor Joseph P. Remington, in Philadelphia.

* The editor has received permission to print this letter from Prof. John Uri Lloyd, a life-long friend of the deceased. The references to the latter's life and character have prompted this action. Owing to the nearness of publication day, other matter relating to Professor Remington will be deferred for the February number.

¹ See *Proceedings of the American Pharmaceutical Association*, 1879, p. 682.

My dear Mr. Eberle: May I not, in the frankest way possible, express to you these thoughts, and may I not accept in expressing them, as a lingering member of the associates of Professor Remington who have passed away, as well as thousands of pharmacists in America who may not feel at liberty, as do I, to take that privilege, that I may add to the foregoing even yet, a further word?

Among the past close friends of Professor Remington, none of whom are now with us, I recall Professor Saunders, of Canada, a bosom friend of Remington; they attended, the National meetings and roomed together. Together they visited England, ovations marking their course in that country. So very close were they that the terms Joseph and William only, were used in conversation. That very talented man, Professor John M. Maisch, a teacher-companion of Remington, attended, always in Remington's company, the meetings of the American Pharmaceutical Association; together they came, never a word of discord between them; companions were they, until came the announcement at our Chicago American Pharmaceutical Association meeting (1893) that Professor Maisch had passed away. Dr. Charles Rice, that remarkable man whose biography has never yet been written, and in my opinion, never can be, was to Professor Remington, as to all others, an inspiration. Of Edw. Parrish, to whom Remington was an assistant, Professor Remington always thought and spoke with the utmost veneration, which was also true of Professor Wm. Procter, Jr. And be it said that the wealth of pharmaceutical opportunity that came to Professor Remington from these teachers and companions, was distributed by him to the world-at-large. To thus name all the companions of the olden time, made by Professor Remington, would be to mention every teacher who had accomplished or contributed to the cause during the period of Remington's early activity.

But not alone with such as these did Prof. Remington fraternize. Not a student, within forty years, has been graduated from the College of Pharmacy in Philadelphia, but feels that he is a close friend of sympathetic Professor Remington. It has been my privilege to meet many hundreds of these graduates of that long-established institution, and never, so far as I can recall, did a discussion connected with pharmacy occur but that the name of Professor Remington came in as that of one the speaker knew personally. This, I will say, is literally true, because every member of the classes of the Philadelphia College of Pharmacy for decades has been to Professor Remington a personal charge, and Remington, being in the department of pharmacy, is naturally very close to any student whose life-work is to be pharmacy.

But what of other companions? To my mind's eye they arise, everywhere.

Wherever there was to be an event in pharmacy that would bring together men imbued with the cause of pharmacy, Remington was sure to be present, and not only was he present, but actively so. A leader among them all was he. If an address was to be made, Remington was the one selected for the purpose, in whatever direction it may have been necessary. And, Remington never failed. At alumni meetings and college reunions held by pharmaceutical organizations Remington was considered one of the members, as much so as though his college course had been in their college. Be it known, to Professor Remington the cause of pharmacy was cosmopolitan, and he considered himself to be concerned in every phase of pharmaceutical effort. Whoever was teaching, whoever was studying, whoever was contributing in any direction, and from any direction, was in his circle.

Perhaps the most enjoyable of all occasions at the various meetings of pharmaceutical associations that it came my privilege to attend, were those of the alumni of the Philadelphia College of Pharmacy, and in these always Professor Remington was not only an integral part, but a cherished guest; a representative of the world-at-large, as well as of the College to which he devoted his special time.

And not alone with those concerned in manipulative pharmacy such as becomes the charge of the apothecary, but of men engaged in pharmaceutical activities on a very large scale, such as came into the field with the entrance of the factory

manufacturer, "the manufacturing pharmacist," did Professor Remington affiliate, by right of education. His personal experience with Dr. Squibb, the connection his preceptors, Procter and Parrish, held with such as Tilden and Company, Charles Ellis Sons and Company, Wm. R. Warner and Company, Hance Brothers and White, Charles Bullock, Sharp and Dohme, Frederick Stearns, of Detroit, and others of the struggling pioneers of those days, led Professor Remington to a kindly affiliation with those establishing, and conducting such industries as these. He appreciated that they had become a part in American pharmaceutical evolution, and that in their activities the factor of pharmaceutical education of the individual should dominate. And hence we note his kindly affiliation and helpful services to those who came in later, principal among whom may be mentioned Parke, Davis & Co., of Detroit, and Eli Lilly & Co., of Indianapolis. Well do I remember how, when Mr. Eli Lilly, founder of the house, gave a home banquet on a special occasion two decades or more ago, Professor Remington made the journey from Philadelphia to Indianapolis. And surely Remington would have made that journey if for no other reason than to please his pupil, J. K. Lilly, whose pharmacy instruction was taken under Professor Remington in the Philadelphia College of Pharmacy. Well do I remember that happy occasion, which it was also my privilege to enjoy.

As would be supposed from the congenial nature of Professor Remington, which so impressed everyone he met, his family relationship is most delightful. To touch this phase of his life is a very delicate subject, even in a letter to a mutual friend, but yet I cannot refrain from expressing to you the pleasures that have come to me in the visits to and from Professor Remington's family, and members thereof. To enter that home, is like entering one's own, because of the whole-souled hospitality of each and every member. To this it may be added that Professor Remington's love and affection for his wife and children, as shown to his personal friends, is only paralleled by a reciprocity from themselves. Taken all in all, a very happy and a very charming family is the Remington family I have in mind.

My dear Mr. Eberle: I feel that this letter is much too long, and yet its space would be much too short were one to attempt to present even the high lights of a biography of Professor Joseph P. Remington. I have recorded but a touch of what came to me in the passing along of a discursive letter, as thought crushed upon thought, event upon event, opportunity close following opportunity in the direction of what I felt needs be said, and yet for lack of space could not be said. Painful though it is to think that I am writing this letter during what may possibly be the closing period of the life of this companion and friend, it is yet a melancholy pleasure to feel that I am not passing the bounds of prudence. All I have said and more, will be felt by others who were more fortunate, others who were in daily touch with Professor Remington, as it was not my privilege to be, and who may not, as do I, assume the responsibility of intruding a personal letter.

Strange how insidiously Time moves us in and out. Of those close in the companionship of Professor Remington and myself in days long gone by, very, very few are living.

May I not close this letter with a sentence from "The Code of Manu"—

"As drifting logs of wood may haply meet
On ocean's waters surging to and fro,
And having met, drift once again apart,
So, fleeting, is the intercourse of men.

"E'en as a traveller meeting with the shade
Of some o'erhung tree, awhile reposes,
Then leaves its shelter to pursue his way,
So men meet friends, then part with them forever."

Sincerely yours,
JOHN URI LLOYD.

CHARLES H. LAWALL

CHARLES HERBERT LAWALL,

PRESIDENT-ELECT OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

As announced in the December issue of the JOURNAL, Charles H. LaWall has been elected president of the American Pharmaceutical Association.

The President-elect was born in Allentown, Pa., 46 years ago, the son of a druggist of that city, who in 1876 moved to Bloomsburg, Pa., where he had accepted a position with the wholesale and retail drug firm of Moyer Bros., in whose establishment the junior LaWall received his early business training, after having been educated in the public schools and at the State Normal School, located at Bloomsburg. His employment in the drug store was a matter of choice, for he early evidenced an interest in the sciences and sought knowledge by studying growing plants and improvising a small chemical laboratory even before attending college.

In 1891, he matriculated at the Philadelphia College of Pharmacy and graduated here in 1893. The degree of Master in Pharmacy was conferred upon him by the same institution in 1905. He sought employment in Philadelphia which offered the opportunity of a more extended acquaintance with the branches that interested him most, and for thirteen years he was engaged in the laboratories of Smith, Kline & French Company. In 1901, Charles LaWall succeeded Frank G. Ryan as Instructor in the Theory and Practice of Pharmacy in his *Alma Mater*, and in 1905 he was elected Associate Professor in the same department.

In 1903, he became associated with Dr. Henry Leffmann, a prominent chemist of Philadelphia, and when the latter decided to retire Prof. LaWall acquired sole ownership of the business. Since 1904 he has been chemist of the Pennsylvania State Dairy and Food Department, and has also served the Federal Government in a related capacity. In 1909 he succeeded Dr. Leffmann as lecturer in the Course of Applied Organic Chemistry at the Wagner Free Institute of Science. He is a joint author with Dr. Leffmann of a book on Chemistry; he assisted in the last revision of the United States Dispensatory and is a frequent contributor to pharmaceutical and chemical publications. Prof. LaWall is a member of the U. S. Pharmacopoeia Revision Committee of which he is secretary, and also chairman of the Subcommittee on Inorganic Chemicals.

His papers presented to the various sections of the American Pharmaceutical Association speak in part for his interest in the organization that has honored him with the presidency. He was vice-president in 1915; from 1907-09 he was secretary of the Section on Education and Legislation and in 1910 the chairman; in 1911-12 he was secretary of the Scientific Section.

Mrs. Charles H. LaWall (*nec* Miss Millicent Renshaw) is also a graduate in pharmacy and renders valuable assistance in the many activities of her husband. Both are regular attendants and workers at the annual conventions of the A. Ph. A.; the latter joined the Association in 1896 and the former in 1905. E. G. E.

EDITORIAL

E. G. EBERLE, Editor

253 Bourse Bldg., PHILADELPHIA

THE VALUE OF INDIVIDUAL EFFORT.

“I WOULD not be one of those who would drive a nail into mere lath and plastering. Such a deed would keep me awake nights. Give me a hammer and let me feel for the furring. Drive a nail home and clinch it so faithfully that you can wake up in the night and think of it with satisfaction, a work at which you would not be ashamed to invoke the Muse. * * * * * Every nail driven should be as another rivet in the machine of the universe, you carrying on the work.”—Henry David Thoreau.

We have often spoken of coöperation; these are times when the loyalty of every individual counts, there should be no neutrals. Just as concerted effort is mandatory in the cause of our country, so is that of every individual pharmacist for pharmacy, so that each one may become a strong support by faithfully doing his part. The great trouble with pharmacy largely is, that too many are standing aloof from doing so, because they seem to feel that what they can do is of little consequence. And still each one has a part in pharmacy and its service to humanity, and has neither right to withdraw nor withhold his support nor belittle his opportunity.

The general, in preparing his plans, cannot ignore the part of the private in the battle; the gunner is dependent on the workman in a far-away munition plant. The medical man must rely on the pharmacist in the pharmaceutical laboratory, if not more directly—on the one who prepares his *armamentarium*. Not one can fail without destroying the efficiency of the other, it is a serious delinquency to disregard the work of any one of them.

What is needed is enthusiasm, which, as Emerson said, “is the leaping lightning, not to be measured by the horse-power of the understanding.” Someone else has said, “enthusiasm is the light that leads and the strength that lifts men on and up in the great struggles of scientific pursuits and professional labor.” It needs that, we believe, in pharmacy, in the importance of its service, and it is the thought of the individual, that his part is of little consequence, that keeps from pharmacists and pharmacy the recognition they and it are entitled to.

The thing is to do our part well, better than it has ever been done before; there may be “laths and plastering” in the construction of the drug business, but let us “feel for the furring,” with the hammer of resolve, drive the nail of our determination into the purpose to progress and clinch it with enthusiasm. Believe firmly that pharmacy has an important part in medicine, and that when it is ignored or neglected, the patient will suffer. The medical man, surgeon or doctor, must look back to the unimportant individual (?), the pharmacist, the person whose part taken by itself may be smaller than his own, yet whose part, if not well done, will prove a serious handicap to his success. And this is applicable to the

pharmacists' service in the Army and Navy. That which the individual can do, and do well, is of real importance, and without doing that, there is deficiency; reversely his coöperation makes for efficiency.

So, then, with the beginning of the year let us drive home, into the thoughts of all pharmacists, the value of individual effort for pharmacy and the Association; each one can do an essential part in contributing to its larger possibilities, by increasing the membership and by participation in the work. One is the minimum, there is no limit to the number of additions each member may be willing to propose and indorse for affiliation in the American Pharmaceutical Association. Every new member adds strength to the organization and makes for its greater possibilities. Be optimistic and enthusiastic, anyone can be pessimistic and indifferent.

E. G. E.

THE IMPORTANCE OF DRUG PLANT CULTIVATION IN THE UNITED STATES.

AMONG the many problems confronting the American manufacturer of drug products, that of securing adequate supplies of crude drugs is of increasing importance. Thus far the cultivation of medicinal plants in the United States has not assumed very great proportions, although many drugs are being supplied in sufficient quantities for domestic needs. A great deal of misinformation has been circulated on the topic and many people have been led to believe that cultivation of medicinal plants is just as simple a matter as the growing of vegetables or crops. This is not the case. We must remember that such plants as Belladonna, Digitalis, Hyoscyamus, Aconite, etc., formerly obtained from Europe, grow wild in their native habitat and are picked by cheap labor, thus making the cost to the purveyor very low. The growing of medicinal plants in the United States, which is not the native habitat of the drugs enumerated above, is a science which requires expert training and supervision. We must provide artificially the conditions under which these plants grow best and the cost and labor is many times what is paid the European peasant who collects drug plants.

Two methods of overcoming the high cost of cultivating drug plants are open to the American grower: first, increasing the number of harvests in one season; second, increasing the amount of active constituent. Experiments have demonstrated that as many as four and five harvests of Belladonna can be obtained in one favorable season if the leaves are stripped from the plants when they attain a certain maximum growth. In former years it was customary to cut down the entire plant at harvest time, thus greatly reducing the yield of Belladonna leaf. There is very little difference in the activity of the leaf of the third or fourth harvesting in comparison with that of the first harvesting as far as the amount of active constituent is concerned.

With regard to increasing the amount of active constituent, experiments

show that by careful selection of seed it is possible to increase in some plants the amount of active constituent three or four times that required by the Pharmacopoeia. Experiments in cross-pollenization have not been successful so far as increasing the amount of active constituent goes. In 500 Belladonna plants grown at Glenolden, Pa., last year the amount of active constituent varied from below $\frac{1}{10}$ of 1 percent to as high as 1.2 percent; the general average was about $\frac{6}{10}$ percent, or twice the Pharmacopoeial requirement. Seed from the plants which yielded a high percentage of alkaloids, when used for propagating purposes in succeeding years, usually produce high alkaloid-containing plants, although this is not always the case. We are confronted with variations due to numerous causes, which must be carefully studied if the drug-plant industry in the United States is to be placed on a competitive footing with that of Europe after the war.

Physiological and chemical tests on the American-grown plants show that some of the old ideas regarding the activity of plants were erroneous; for instance, it has not been so long since American Cannabis was not thought fit for medicinal use, but it has been clearly demonstrated that it is just as active and satisfactory as the Indian Cannabis and our Pharmacopoeia now recognizes it. For many years it was thought that Digitalis leaves of the first year's growth were not active and that only leaves of the second year's growth gave satisfactory results in medicinal preparations. This idea has been shattered also and the Pharmacopoeia now makes no distinction between the first and the second year leaf and rightly.

The problem of properly drying plants after they have been cultivated is in some cases a difficult one, owing to the frequent changes in climate at harvest time. However, this problem is also being solved so that the natural color is preserved to a large extent in the cultivated plants when they are dried, thus obviating any criticism as regards the color of the finished preparations. While the problem of color in pharmaceuticals is merely a psychological one, it seems to be difficult to dispel the belief, especially among laymen, that color is a criterion of strength or activity.

Were it not for the chemical and physiological methods of assaying and standardizing drugs, the fact that American-grown drug plants are sometimes very high in their yield of active constituents would be a source of danger. Obviously, a tincture of Belladonna made from a drug which assays three times the U. S. P. strength would be a dangerous preparation if used in the ordinary dosage. However, the assay shows what the strength of the drug is and what the strength of the finished product is and we can make our dilutions or concentrations accordingly.

The scarcity of some of our important botanical drugs is apt to lead to adulterations. It is fortunate, therefore, that the Government has an organization (Bureau of Chemistry) for detecting adulterants, etc., under the Food and Drugs

Act, thus protecting the physician, the pharmacist and the patient. Nevertheless, there is always opportunity for the perpetration of fraud and "Safety First" must be our motto when purchasing crude drugs and preparing galenicals.

The American crude drug industry has made remarkable advances since 1914, and with the advances that are being made each year and the scientific investigations conducted in the various research laboratories, there seems to be no doubt as to its future permanency.

H. K. M.

PHARMACY AND THE WAR.

PROF. ALEXANDER TSCHIRCH about a year ago delivered a lecture before the German Pharmaceutical Society in which he stated that "the production of a sufficient quantity of food is essentially a botanical problem, as meat is only vegetable food converted by animals into a suitable form." The thought can, in a way, also be applied to the production of vegetable materia medica products.

President C. A. Hill, in his presidential address at the annual meeting of the British Pharmaceutical Conference, July 11, 1917, spoke of the "British Medicine Supply in War Time," in which he referred to the shortage of botanical drug supplies.

A symposium on drug culture constituted part of the program of the Scientific Section at the Indianapolis meeting of the American Pharmaceutical Association. Thus the importance of plant culture is recognized in all countries, and present conditions have intensified the interest of the subject.

Whether the deficient supply of official drugs, the possibility of substituting specially cultivated or other drug-yielding plants for them, warrants the issuance of a supplement to the Pharmacopoeia in which other medicinal agents are to be included, may be a matter worthy of consideration. It is not contended that the necessity exists, but the Government has permitted the use of some non-official drugs, and it might be deemed advisable, in some instances, to give pharmacopoeial sanction also, and at the same time make advantageous changes in certain menstrua, solvents, vehicles, standards and tests; or, it may be more expedient to have these matters taken up in the National Formulary, should the proposition be worthy of serious consideration.

Under *General Principles to be Followed for the Ninth Revision of the Pharmacopoeia* (13, p. XXXIII) is the following: "Supplement.—It is recommended that the Committee of Revision be authorized to prepare a supplement to the Pharmacopoeia at any time they may deem such action desirable." It must be remembered that the conditions now existing are temporary; on the other hand, that the next revision of the Pharmacopoeia will probably not be completed before 1925. Some official drugs, oils, etc., are unobtainable; alcohol, sugar and glycerin are, in a degree, restricted; progress in drug culture may yield drugs

of which the galenical preparations differ physically from those heretofore prepared. There is large demand for preparations for which standards should be provided. This is only suggestive and should be studied carefully from the standpoint of necessity and helpfulness; the prompting is an expression of a desire, not to be delinquent in discovering the needs of pharmacy.

President C. A. Hill, in his address, recommends the promotion of research work by pharmacists in investigation of the extent of deterioration of drugs, chemicals and galenicals under normal conditions of the pharmacy, and also as to how far physical constants are good criterions of galenical preparations manufactured in accord with official directions.

The concluding paragraphs are particularly interesting to us at this time. He recommends the formation of a Public Policy Committee, "on which every side of pharmacy should receive representation proportionate to the merits and magnitude of the interests concerned." Very much like the recommendation of Ex-President Frederick J. Wulling for the organization of the American "body-pharmaceutic." President Hill continues, "the Government to-day will not deal with individuals, but only with associations representing large interests. Such a body could claim to be truly representative of pharmacy, and its views would command attention."

The address concludes: "The third year of the war (July 1917) is drawing to a close, and when we consider how complex a thing is an adequate and complete service of medicine, the difficulties which have had to be met, and how few have been the cases in which supplies have failed; that the standard of quality in the medicine service has never for a moment relaxed—perhaps, after all, pharmacy has not done so badly. To-day, when the depths of chemical knowledge are being plumbed for the purposes of destroying life, there is some satisfaction in the reflection that the resources of medicine and pharmacy are devoted to saving it; not only, indeed, to the curing of the sick and wounded, but to maintaining health of our troops and of the civil population. An adequate medicine service is a national asset; that it has been provided under circumstances of unparalleled difficulties is no small thing."

The same thoughts are thoroughly applicable in this country and our efforts should be continued in persuading the Government to take this view and grant adequate recognition to pharmacy and pharmacists. Without this there is lack of coördination in the medical service whereby injustice is done to business, the military organizations, and civilians. Certainly pharmacy is and has been an aid to many of the departments of the Government and could be made more serviceable if for every department in which pharmacy is concerned, one or more pharmacists would be provided; surely, many difficulties that confront the drug business, as well as the Government, would be avoided.

BIOLOGICAL STANDARDIZATION OF THE HEART TONIC PREPARATIONS.*

BY H. C. COLSON, JR.

Up to the present time it has been generally recognized that the standardization of the Heart Tonic Preparations such as digitalis, strophanthus, squill and others of less importance, may best be accomplished by biological rather than by chemical methods of assay. The nature of the active principles in the various drugs with the possible exception of strophanthus, in which the strophanthin can comparatively easily be estimated chemically, is such that they cannot conveniently be isolated and estimated in a pure state. Further, since each of these drugs, as for instance digitalis, contains quite a number of active principles which are not always present in the drug in the same definite proportion to each other, it would be impossible to base the valuation of the drug on the estimation of only one active principle.

The value of the drug, *i. e.*, the estimation of its active principles, which may or may not act synergistically upon each other, can, however, be determined by biological assay.

The real problem which confronts investigators in this branch of science, resolves itself into determining the biological method of assay most suitable for the preparations in question, that is, the method which approaches in its accuracy, rapidity of execution and dependability under general laboratory conditions that of the best chemical analytical procedures.

Biological methods of estimation or standardization are in general inherently subject to certain variables which tend to affect the final results. This is true whether the object is to standardize a disinfectant by the Hygienic Laboratory Coefficient Method, or to assay digitalis preparations by the one-hour frog, 12-hour frog or the cat method.

In all cases, with the exception of the cat method, the factors of time, temperature at which the drug is allowed to act, relative concentration of test solution and rate of absorption (in the case of frog assays), or the type of organism employed (in the case of bacteriological standardizations), enter to modify, individually and collectively, the final result. The biological method which has the fewest number of variables and at the same time takes into account the action upon which its therapeutic usefulness depends, should be the one selected.

In my opinion, the cat method offers the best means for standardizing the heart tonic drugs of the digitalis series. Briefly stated, this method consists in

*Read before Scientific Section, A. Ph. A., Indianapolis meeting, 1917.

ascertaining the minimum lethal dose per kilo cat, the drug being slowly injected into the femoral vein until death of the animal with typical digitalis poisoning occurs, and expressing the minimum lethal dose (M. L. D.) as percentage strength of an arbitrary standard, which has been adopted as 100 mgs. of digitalis leaves per kilo body weight.

The reasons for this opinion are based on the experience of this laboratory in the physiological assay of heart tonic preparations by both frog and cat methods.

1. *The One-Hour Frog Method of the U. S. P. IX.* The one-hour frog method, as recommended by the U. S. P. IX, has, in my opinion, the following variables and constants upon which the final result depends, namely:

- (1) Concentration of Test Solution, whereby all or only part of the solution may be absorbed within the time limit of one hour.
- (2) Absorption Rate due to nature of Test Solution; for instance, digitalin is absorbed much more slowly than tincture of digitalis, etc.
- (3) Seasonal variation of Test Animal.
- (4) Degree of accuracy in weighing frogs and administering dose.

The factors in the assay which can be made constant if due care is taken are:

- (a) Length of Test Period (1 hour).
- (b) Temperature at which the drug is allowed to act (20° C.).
- (c) Species of Test Animal (*Rana Pipiens*).

Furthermore, as the final calculation of the strength of a sample is dependent upon a secondary assay of a so-called standard substance, ouabain, which assay is likewise affected by the same experimental conditions as set forth above, it is readily seen that in reality at least eight variable factors are liable to enter into a single standardization by the one-hour frog method.

The Factor of Concentration.—The concentration of the test solution recommended for injection, *i. e.*, that the total average dose does not exceed 0.015 mil for each gramme of body weight of frog, or an average total of 0.5 mil, is not always attainable, and many times where the sample is low in toxicity it is necessary to give over 1 mil, which is equivalent to 0.030 mil per Gm. frog. Other things being equal, it is obvious that the larger the quantity of liquid necessary to represent a certain dose, the longer the time required for total absorption. The volume of the dose may be made smaller by evaporating the samples to give the required concentration, but no matter how careful the process of evaporation may be, it is more than probable that some loss in activity will take place. This applies especially to the digitalis series of preparations.

Rate of Absorption.—Experience has shown that some substances are absorbed more slowly than others; among these are, as already mentioned, solutions of digitalin; further solutions of digitoxin and those containing acetic acid. Other investigators have recorded similar observations.¹ The rate at which the dose is absorbed after injection into the lymph sac frequently depends upon the health of the frog. The so-called red-legged disease is very prevalent among frogs and without doubt such diseased frogs give unreliable results. However, it is equally true that apparently healthy frogs often have a relatively large amount of unabsorbed solution in the lymph sac at the end of the test period of one hour. This applies especially to fluidextract of digitalis, digitalin and acetic squill.

While therefore frogs are entirely unsuitable for assaying digitalin by the one-hour method very concordant and satisfactory results are obtained by the cat method as shown in Table I. Therefore the cat method has proved with me to be a very useful and satisfactory method of assaying hypodermic and tablet triturate preparations of digitalin.

TABLE I.—BIOLOGIC ASSAY OF DIGITALIN.

(Merck's Digitalin.)

(Test Animal—Cat.)

| Date of assay. | Sex and wt. (kilos) of T. A. | Value of vol. injected | Lethal Dose for test animal (mils). | L. D. per kilo (mils). | L. D. expressed as Gms. digitalin per kilo. |
|----------------|------------------------------|------------------------|-------------------------------------|------------------------|---------------------------------------------|
| 9/19/16 | *2.49 | 1 mil = .001 | 14 | 5.63 | .005,63 |
| 11/3/16 | *2.47 | 1 mil = .001 | 14 | 5.67 | .005,67 |
| 3/15/17 | †2.78 | 1 mil = .001 | 16 | 5.75 | .005,75 |
| 3/22/17 | †3.40 | 1 mil = .001 | 19 | 5.88 | .005,88 |
| 3/26/17 | *3.22 | 1 mil = .001 | 19 | 5.90 | .005,90 |

* = Female. † = Male.

NOTE.—The average M. L. D. expressed in Gm. digitalin per kilo cat is equal to .005,77.

The absorption of preparations of squill containing acetic acid is especially slow and results obtained by the one-hour frog method are generally especially unsatisfactory.

The apparent difference in toxicity of two preparations or substances may possibly be due largely to their different rates of absorption by the frogs. The more rapid the absorption, the greater the apparent toxicity. The one-hour frog method does not properly take care of this source of error, as the test period of one hour is too short and constitutes, in my opinion, the chief objection or criticism of this method of assay. The fact that absorption rates of individual healthy frogs are different and also that some members of the digitalis series are absorbed much more rapidly than others, should be taken into account in a biologic assay. The 12-hour frog method overcomes this objection and in this respect is to be preferred to the method recommended by the U. S. P.

Changes in Reaction of Frogs at Different Seasons.—That a seasonal variation exists in the reaction of frogs to the digitalis series has been generally claimed, but so far as my observations are concerned, there is nothing definite to be concluded on this point. A possible lessening in the vitality of the frogs has been noted during the summer months which may give an unwarranted increase in toxicity of samples. No positive evidence of this has been noted, but undoubtedly one lot of frogs differs from a succeeding lot in its reactions to drugs even at the same season of the year. Even the same lot of frogs may react differently to the same sample of ouabain when tested at different times. For example: 0.000,000,7 Gm. per Gm. frog was the M. S. D. by the one-hour method for a sample of ouabain, and when assayed the following day on the same lot of frogs a M. S. D. of 0.000,000,9 Gm. per Gm. frog was obtained.

TABLE II.—OUABAIN.
Biologic Assays by "One-Hour Frog."

| Series No. | Date of assay. | Data on | | M. S. D. Gm. per Gm. frog. |
|------------|----------------|----------------------------------------------------------|-----------------------------------------------|----------------------------|
| | | Ouabain. | Frogs. | |
| 1 | 7 3 17 | Stock sol. A made Sept. 7, 1916 | Held 1 month in storage tank previous to test | .000,001,1 |
| | 7 3 17 | Stock sol. B made Aug. 29, 1917, from new sample ouabain | Held 1 month in storage tank previous to test | .000,000,7 |
| 2 | 7 3 17 | Stock A | Held 2 days in storage tank previous to test | .000,000,7 |
| | 7 3 17 | Stock B | Held 2 days in storage tank previous to test | .000,000,6 |

It is to be noticed that in both series of tests tabulated above, the new sample of ouabain was slightly more toxic than the other. These two series bring out not only the difference in reaction of two lots of frogs to the same sample of ouabain, but also the difference in toxicity between ouabain obtained from different sources of supply.

It will also be seen that both lots of frogs showed a slightly greater toxicity for the Stock B ouabain.

These two samples of ouabain were assayed by the cat method with the following results:

TABLE III.—OUABAIN.
Assayed by Cat Method.

| Series No. | Date of assay | Data on ouabain used | Sex and wt. of test animal, kilos. | Value of solution injected. | Dose of dil. | Equiv. dose of original. | Gm. ouabain per kilo cat. |
|------------|---------------|-------------------------------------------------------------|------------------------------------|-----------------------------|--------------|--------------------------|---------------------------|
| 1 | 7 31 17 | Stock sol. A made Sept. 7, 1916 | †2 10 | 1 mil = .000,01 Gm. | 29 | 15 22 | .000,132,2 |
| | | | †4 15 | 1 mil = .000,02 Gm. | 30 | 7 23 | .000,144,5 |
| | | | *2 85 | 1 mil = .000,01 Gm. | 36 | 12 63 | .000,126,3 |
| 2 | 7 31 17 | Stock sol. B made Aug. 29, 1917, from new sample of ouabain | *2 09 | 1 mil = .000,01 Gm. | 28 | 9 37 | .000,093,7 |
| | | | *2 56 | 1 mil = .000,01 Gm. | 20 | 7 82 | .000,078,2 |
| | | | †3 33 | 1 mil = .000,01 Gm. | 26 | 7 81 | .000,078,1 |

† = Male. * = Female.

The variation in toxicity of ouabain of different source therefore manifests itself also in the cat tests. For Stock A ouabain, the average M. L. D. is 0.000,129,3 Gm. per kilo and for Stock B it is 0.000,078,2 Gm. per kilo cat, hence the latter sample is decidedly more toxic than the other and in this respect the cat method corroborates the frog assay. The so-called "standard" of the U. S. P. one-hour frog assay method is therefore of doubtful value, a fact which has been verified by Rowe.²

TABLE IV.—ASSAYS MADE ON DIFFERENT DATES, SHOWING VARIATIONS IN TOXICITY OF OUBAIN AND DIGITALIS, AND EFFECT UPON PERCENT ACTIVITY AS DETERMINED BY U. S. P. IX.

| Sample. | Date examined. | One-Hour Frog Method. | | | | M. L. D. Cat Method. | | |
|-----------------|----------------|-----------------------|-------------------|------------------|-------------------------------|----------------------|-------|-------------------|

NOTES:

(a) Three cats were used for each cat assay, and the average taken for above table.

(b) One-hour frog method of U. S. P. IX used.

The data in Table IV shows that when tested by the one-hour frog method, the variation in the toxicity of ouabain is proportionally greater than that of digitalis preparations tested at the same time. In other words, it is due to this variableness of the ouabain or so-called standard that the samples show such large differences in activity when tested on different dates. Much more constant results are obtained by M. L. D. cat method. While the data are not complete in all cases, still there is sufficient to bring out this point.

Degree of Accuracy Obtainable in Weighing Frogs and Administering Dose.—

The U. S. P. recommends that the frogs for assay be weighed to 0.1 Gm. Whether it is possible to comply with this degree of accuracy is doubtful, owing to the large moisture content of the animals and the difficulty in wiping them completely dry. Frogs removed from the constant temperature bath, weighed, returned to the bath for one hour and then reweighed, invariably show a change in weight, generally a loss of approximately one gramme per frog, as shown by the following tables.

A lot of frogs which had been kept in running cold water for one month was weighed, then placed in a constant temperature bath for one and one-half hours,

three hours and twenty-four hours, and after the lapse of these periods was re-weighed. The results are given in Table V, which shows that frogs lose considerable weight during the keeping and that the loss is to some extent in proportion to the length of time the frogs are kept, as is evident from the results in this table. This loss applied both to frogs which had been kept for one month in a storage tank and to frogs which were examined two days after their arrival. The loss in this latter lot of frogs was even greater than with the former (see Table VI). The conclusion is that frogs cannot be first weighed and then held at a special temperature an hour or two before injecting doses based on the initial weight if accuracy is desired; and also that frogs should be weighed to the nearest Gm. rather than 0.1 Gm. as specified by the U. S. P. IX.

TABLE V.—SHOWING VARIATION IN WEIGHTS OF FROGS PREVIOUSLY KEPT IN STORAGE TANK FOR ONE MONTH.

| Frog No. | Original weight in Gm. | Weight after 1½ hrs. in 21° C. bath. | Weight after 3 hrs. in 21° C. bath. | Weight after 24 hrs. in 21° C. bath. | Change in weight at end of | | |
|-----------|------------------------|--------------------------------------|-------------------------------------|--------------------------------------|----------------------------|--------|---------|
| | | | | | 1½ hrs. | 3 hrs. | 24 hrs. |
| 1 | 20.3 | 21.0 | 20.6 | 17.9 | +0.7 | +0.3 | -2.4 |
| 2 | 16.1 | 15.9 | 15.9 | 15.8 | -0.2 | -0.2 | -0.3 |

| 8 | 21.1 | 20.2 | 20.3 | 20.2 | -0.9 | -0.8 | -0.9 |
| 9 | 20.1 | 29.2 | 29.1 | 24.8 | +0.1 | 0.0 | -4.3 |
| 10 | 21.1 | 21.4 | 21.7 | 20.0 | +0.3 | +0.6 | -1.1 |
| 11 | 20.8 | 20.8 | 20.5 | 20.0 | 0.0 | -0.3 | -0.8 |
| 12 | 18.6 | 18.4 | 18.3 | 17.2 | -0.2 | -0.3 | -1.4 |
| 13 | 25.8 | 25.1 | 25.0 | 24.3 | -0.7 | -0.8 | -1.5 |
| 14 | 34.0 | 33.3 | 33.2 | 33.0 | -0.7 | -0.8 | -1.0 |
| 15 | 27.5 | 28.6 | 28.8 | 28.1 | +1.1 | +1.3 | +0.6 |
| 16 | 26.7 | 26.2 | 26.3 | 25.9 | -0.5 | -0.4 | -0.8 |
| 17 | 18.8 | 18.0 | 17.5 | 17.5 | +0.1 | -1.3 | -1.3 |
| 18 | 17.6 | 17.5 | 17.7 | 16.2 | -0.1 | +0.1 | -1.4 |
| 19 | 21.3 | 21.7 | 21.9 | 20.5 | +0.4 | +0.6 | -0.8 |
| 20 | 22.7 | 22.8 | 23.5 | 21.0 | +0.1 | +0.8 | -1.7 |
| Averages. | | | | | -0.07 | -0.17 | -1.39 |

Granted that a frog is accurately weighed, which in my opinion would be the nearest Gm. or half Gm., and also that the exact dose is administered, there is still the probability that some of the drug may leak out during the test. This may not take place through the point of injection but the fact that the injected fluid distends the tissues, which are readily permeable to fluids, furnishes the basis of this criticism of the one-hour frog method.

The Factor of Length of the Test Period.—In regard to the time factor, it may be said that this can doubtless be made practically a constant if due care is exercised. A few minutes plus or minus one hour frequently have been shown to be highly important, a minus result, *i. e.*, frog heart still beating or in diastole at the end of one hour, being changed to plus result, *i. e.*, systolic standstill of frog heart,

TABLE VI.—SHOWING VARIATION IN WEIGHTS OF FROGS PREVIOUSLY KEPT IN STORAGE TANK
2 DAYS.

| 21 | 32.3 | 31.4 | 32.3 | 29.5 | —0.9 | 0.0 | —2.8 |
| Average, | | | | | —0.995 | —1.14 | —2.69 |

a few minutes after the hour. It has been noted many times in the one-hour frog assay that a positive at the end of exactly one hour is changed in two minutes thereafter to a negative result. In the case of digitalis the administration of sublethal doses may have a paralytic action on the heart from which the frog may and does recover, hence this also accounts for some of the discrepancies in this method of assay.

The Importance of Temperature at Which Test Is Made.—The temperature at which the frogs are maintained during the experiment has been repeatedly shown to have an important bearing on the result.^{1,3}

In most laboratories it is feasible to maintain the 20° C. bath recommended by the U. S. P. and the factor of the temperature at which the medicated frog is kept for one hour cannot be overestimated because dependent upon it in large measure is the rate of absorption and *vice versa*.

The Species of the Test Animal.—That the species of frogs used may affect the assay is generally admitted, but by using only one species of frogs, preferably *Rana Pipiens* as recommended by the U. S. P., this factor may also be rendered a constant.

Before taking into consideration the cat method of biochemic assay, other weak points of the frog assay may be mentioned.

My experience has shown that the average frog assay requires oft-repeated trial assays before the M. S. D. can be found. After reaching the approximate M. S. D. it is necessary to obtain the minimum dose which gives two positives

out of three, or better three out of five. What renders the preliminary assays so uncertain at times in their value for subsequent tests, is the fact that frogs very often show systolic standstill "out of order." For example, a preliminary series of three frogs at doses .006, .009 and .012 mil per Gm. body weight, respectively, gives results, —, +, +. Instead of a M. S. D. between .006 and .009 as indicated by the first series, subsequent trials show the M. S. D. around .012 or even above. In other words, frog with dose .009 and heart in systole was "out of order."

Another example frequently found in practice is a preliminary assay, where doses of .000,000,5, .000,000,7, .000,000,9 and .000,001,1 Gm. ouabain per Gm. body weight of frog give —, —, + and + results, respectively. This trial assay indicates a M. S. D. of between .000,000,7 and .000,000,9, but the completed assay indicates a M. S. D. of .000,000,7, or even less. The result is that the preliminary tests are often entirely misleading, a circumstance which often calls for a greatly increased number of trial assays.

The above considerations lead to the question of relative costs of the two methods. It has been my experience that a frog assay costs on the average \$1.15 for animals compared with \$0.70 for a cat assay. No difficulty has been experienced in obtaining test animals, either cats or frogs, as has been reported by some writers.

Finally, the following very important fact must be mentioned, namely, that the end point in one-hour frog-heart assay is many times far from satisfactory, and its interpretation one way or the other depends in large measure on the operator.

It has been my observation that the end point for the one-hour frog is frequently very indefinite as the heart does not stop in well-defined systole, in other words, there is a varying degree of paralysis of the heart which is interpreted according to the operators' judgment.

II. *Biologic Standardization—By the Cat Method.*—The cat method employed in this laboratory is a modification of the Hatcher procedure.⁴ The suitably diluted sample is slowly injected into the femoral vein until the death of the animal with typical digitalis poisoning occurs. A solution of ouabain is not used, as nothing is gained thereby, either in time or in the accuracy of the test. As to my preference of the cat method over the one-hour method, the following may be pointed out:

The M. L. D. method for the physiologic standardization of the digitalis series using the cat as the test animal has, in the writer's opinion, many advantages for the following reasons:

- (1) A shorter time is required for making an average assay, *viz.*, two hours (cat) as compared to three hours (frog).
- (2) Cost of animals cost per assay less, \$0.70 *vs.* \$1.15.
- (3) Assay capable of greater absolute as well as relative accuracy, since
- (a) Cat assays are not affected by seasonal variation in test animal which is clearly shown in Tables I and X.
- (b) Age or sex of T. A.: immaterial, as shown in the same tables and also in Table VII.
- (c) Definite end point, *i. e.*, death.
- (d) Quantity of drug injected is accurately measured.
- (e) Calculation of activity or strength is not dependent upon a secondary assay (ouabain) which would tend to lower the degree of accuracy by introducing more variables.

(4) According to the U. S. P. the application of the digitalis series in therapeutics is proportional to its toxicity.

Time Necessary to Complete an Assay by Cat Method.—Compared with the one-hour frog, a much shorter time is needed to make an average assay. The assay can be completed in two hours, and usually the first two cats will be sufficient to obtain concordant results, and it is seldom necessary to use three animals.

Relative Cost of Two Methods.—The average cost of the two methods of assay has already been stated and is self-explanatory. This result is not, however, in agreement with the findings of some laboratories, as, for example, the Hygienic Laboratory.⁵

REASONS WHY CAT ASSAY IS MORE ACCURATE AND DEPENDABLE.

(a) In regard to the reaction of the cat to the active principles of the digitalis series, it has been my observation that it does not change from season to season, a fact borne out by data in Tables I and X. In this respect it seems to be an entirely satisfactory test animal and is very constant in its susceptibilities to the action of the digitalis series. The cats which have been used for standardization tests in this laboratory have been typical of the common stray cats of any large city which would ordinarily in time be destroyed by the duly authorized city officials. It has been my experience that such cats are seldom diseased.

(b) Age and sex of the cat are immaterial according to my experience. Results obtained by using female cats of 1.5 kg. body weight will check those of male cats weighing 3.0 kg.

(c) Cats can be weighed much more accurately than frogs and, furthermore, they do not change weight, at least during the period of the assay, as is the case with frogs. Roughly, the average error in weighing cats is ± 0.5 percent and for frogs it amounts to ± 2.0 percent. No leakage of the test solution during injection into the femoral vein of the cat is possible and since the total amount of drug injected is accurately measured by a burette, the calculation of the physiologic strength of the sample can approach in accuracy that of a quantitative chemical analysis.

Applicability of Cat Method to Biologic Standardization of Heart Tonics.—The cat assay method, while inherently subject to a certain limit of accuracy due to the fact that all physiologic standardizations are reactions between active chemical principles and healthy living tissues, has practically no variables to deal with, such as temperature, time or rate of absorption, etc., and hence in my opinion the percentage error is much less than in the assay recommended by the U. S. P. IX. The cat method of assay, as in all applications of biologic reactions to the purposes of quantitative standardization, requires that at least two out of three tests on the same sample shall be concordant. This is necessary because of the fact that individuals of the same species, whether man or the lower animals, show differences in their reaction to drugs which may be both qualitative and quantitative. The differences are generally quantitative and hence in all biologic assays one must obtain a majority number of concordant results in each series of tests. In this way the peculiar or exceptional reactions of a drug upon the test animal, *i. e.*, its idiosyncrasy, can be taken care of.

The argument is often made by those unfamiliar with physiologic testing, that a biologic test on cats, etc., does not furnish a reliable guide to the action or activity of a drug so tested, when it is applied to man. It is probably true that what constitutes a therapeutic or toxic dose of digitalis for a cat would not proportionally be the same for a man, but it is true that in both instances the typical actions of a potent digitalis preparation would be present.

The real purpose of biologic testing is to measure the strength or activity of a preparation, so that it may be adjusted to a uniform or standard strength,

i. e., standardized. The method of assay which accomplishes this object with the greatest degree of accuracy is the logical one to employ. The value of such a standardized product to the practicing physician is obvious.

The U. S. P. states that preparations of digitalis after being assayed by the "One-Hour Frog" (a toxic method) should be corrected so as to conform to the standard adopted. In my experience, the cat method, which also belongs to the toxic type of assay, has been more satisfactory in all respects for purposes of estimating or standardizing. Because in the cat method fewer variables enter to lower the limit of accuracy, the ratio between the toxicity of samples and their therapeutic efficiency must be more constant when determined by this method.

In this connection the following tables giving the results of biologic assays upon a series of digitalis samples will be of interest.

TABLE VII.—A COMPARISON OF BIOCHEMIC ASSAYS ON SAMPLES OF TINCTURE OF DIGITALIS BY THE CAT AND "ONE-HOUR FROG" METHODS.

| Sample No | One-Hour Frog. | | | M. L. D. for Cat. | | | |
|-----------|------------------------------|----------------------------|----------------------------------|-------------------------|------------------------------------|-----------------------------------------|------------------------------------------|
| | M. S. D. of ouabain Gm. Gm. | M. S. D. of sample mls Gm. | Percent strength by U. S. P. IX. | Wt. (kilos) and sex. | Mils per kilo. | Percent strength (100 mgs. lvs = 100%). | Ratio of percentage strengths Cat: Frog. |
| 1 | .000,000,8 | .007 | 137.0 | 3.11* 2.57* | 1.156 } 1.090 } 1.123 | 89.0 | 1 : 1.540 |
| 2 | .000,001,0 | .020 | 60.0 | 3.41† 2.91* | 1.114 } 1.139 } 1.124 | 89.0 | 1 : 0.67 |
| 3 | .000,000,9 | .011 | 98.2 | 2.20* 2.88* | 1.18 } 1.18 } 1.18 | 84.8 | 1 : 1.158 |
| 4 | .000,000,8 | .009 | 106.5 | 3.52† 3.40† | 1.193 } 1.176 } 1.184 | 84.5 | 1 : 1.260 |
| 5 | .000,001,2 | .010 | 144.0 | 3.66† 2.17* | 1.147 } 1.290 } 1.217 | 82.2 | 1 : 1.753 |

| 12 | .000,000,9 | .010 | 108.0 | 4.29† 3.35† 2.41* | 1.024 } 1.372 } 1.036 } 1.03 | 97.1 | 1 : 1.112 |

NOTES:

The average ouabain M. S. D. obtained from above table is .000,000,83.

The average ratio of percentage strength equals Cat : Frog = 1 : 1.228.

† = Male. * = Female.

TABLE VIII.—REARRANGEMENT OF TABLE VII IN ORDER OF PERCENTAGE STRENGTHS AS DETERMINED BY EACH ASSAY METHOD.

| Sample No. | Percentage strength by frog assay. | Sample No. | Percentage strength by cat assay. |
|------------|------------------------------------|------------|-----------------------------------|
| 11 * | 180.0 | 11 * | 137.8 |
| 10 | 154.3 | 8 | 116.4 |
| 7 | 147.5 | 10 | 109.6 |
| 5 | 144.0 | 7 | 107.1 |
| 1 | 137.0 | 9 | 102.5 |
| 6 | 120.0 | 12 | 97.1 |
| 9 | 119.7 | 6 | 93.5 |
| 12 | 108.0 | 1 | 89.0 |
| 8 | 107.9 | 2 | 89.0 |
| 4 | 106.5 | 3 | 84.8 |
| 3 | 98.2 | 4 | 84.5 |
| 2 | 60.0 | 5 | 82.2 |

*It will be seen from the above table that in only one instance, namely, sample of digitalis No. 11, are the samples arranged in the same order of strength by both methods of assay.

Table VII shows that excellent check results can be obtained on the same sample regardless of the weight and sex of the cat. This fact is also brought out by data in Table I.

TABLE IX.—OUABAIN.

Biologic Assays.

| Date. | One-Hour Frog M. S. D. | Date. | One-Hour Frog M. S. D. |
|----------|---------------------------|---------|---------------------------|
| 9/26/16 | .000,000,5 | 3/27/17 | .000,000,8 |
| 10/19/16 | .000,000,6 | 3/30/17 | .000,001,1 |

| 1/19/17 | .000,000,6 | 5/17/17 | .000,001,2 |
| 1/22/17 | .000,000,55 | 5/17/17 | .000,001,3 |
| 1/23/17 | .000,000,7 | 5/18/17 | .000,000,6 |
| 1/25/17 | .000,000,65 | 5/21/17 | .000,001,0 |
| 1/29/17 | .000,000,6 | 5/22/17 | .000,001,1 |
| 2/12/17 | .000,000,8 | 5/24/17 | .000,000,9 |
| 2/14/17 | .000,000,85 | 5/25/17 | .000,000,9 |
| 2/21/17 | .000,000,7 | 5/28/17 | .000,000,9 |
| 3/13/17 | .000,001,1 | 6/4/17 | .000,000,8 |
| 3/15/17 | .000,001,1 | 6/7/17 | .000,000,9 |
| 3/19/17 | .000,000,8 | 6/12/17 | .000,000,7 |
| 3/19/17 | .000,000,7 | 6/13/17 | .000,001,0 |
| 3/26/17 | .000,001,1 | 6/21/17 | .000,001,0 |

The preceding table, IX, gives the results of assay of ouabain by the one-hour frog method extending over the last nine months. The average of the 56 assays is .000,000,82 Gm. ouabain per Gm. body weight of frogs as against the .000,000,5 Gm. standard given by the U. S. P.

The lowest M. S. D. (minimum systolic dose) was .000,000,5 and the highest .000,001,3 Gm. ouabain per Gm. body weight of frog, thus showing a variation of 160 percent. The average of all results over the nine-month period using the same stock sample of ouabain, but many different lots of frogs, is .000,000,82 Gm. ouabain per Gm. body weight. This is much larger than the standard used in the "one-hour method" specified by the Pharmacopoeia, but agrees very closely with that obtained by Rowe,² namely, .000,000,86 Gm. per Gm.

A maximum variation in toxicity of ouabain of only 30 per cent is obtained when cats are used as the test animal as may be seen from Table X.

TABLE X.—BIOLOGIC ASSAY OF OUABAIN.
Test Animal—Cat.

| Date of assay. | Sex and wt. (kilos) of T. A. | Value of sol. injected. | Lethal Dose for Test Animal (mils). | L. D. per kilo (mils). | L. D. expressed as Gm. ouabain per kilo. |
|----------------|------------------------------|-------------------------|-------------------------------------|------------------------|------------------------------------------|
| 11 28/16 | † 96 | 1 mil = .000,01 | 34 5 | 11 66 | .000,116,6 |
| 11 28, 16 | † 2.52 | 1 mil = .000,01 | 33 0 | 13 10 | .000,131,0 |
| 12 13 16 | * 2 45 | 1 mil = .000,01 | 35 0 | 14 29 | .000,142,9 |
| 12 14 16 | * 1 80 | 1 mil = .000,01 | 21 0 | 11 66 | .000,116,6 |
| 12 21 16 | † 3 10 | 1 mil = .000,01 | 40 0 | 12 90 | .000,129,0 |
| 4 4 17 | † 2 67 | 1 mil = .000,02 | 19 0 | 7 12 | .000,142,4 |
| 4 4 17 | * 2 34 | 1 mil = .000,02 | 15 0 | 6 72 | .000,134,4 |
| 4 6 17 | † 3 23 | 1 mil = .000,02 | 18 0 | 5 57 | .000,111,4 |
| 8 1 17 | † 2 19 | 1 mil = .000,01 | 29 0 | 13 22 | .000,132,2 |
| 8 1 17 | † 4 15 | 1 mil = .000,02 | 30 0 | 7 23 | .000,144,5 |
| 8 8 17 | * 2 85 | 1 mil = .000,01 | 36 0 | 12 63 | .000,126,3 |

† = Male. * = Female.

NOTE: Ouabain solution made up September 7, 1916.

1 mil = .001 Gm. Ouabain.

The above table shows that the minimum lethal dose varies from .000,111,4 Gm. to .000,144,5 Gm. per kilo cat, or, in other words, a variation of 29 percent as compared with 160 percent obtained by assaying ouabain with the frog as the test animal. It may readily be seen from a comparison of Tables IX and X that the cat method eliminates the factors of time, temperature at which drug is administered, age and sex of the animal.

The frog assays, on the other hand, are vitally affected by the factors of time and temperature, which in turn have an important relation to the absorption rate of the test solution.

The conclusion, offered by Edmunds and Hale, that in most cases the toxic action is not on the heart but on the respiratory centers, hence, "methods which employ as a standard the minimum lethal dose obtained from the higher animals are not applicable to the physiological assay of the digitalis series," is now corroborated by my experience. In practically every assay by the cat method which I have made the toxic action is not upon the respiratory centers, but upon the heart. This is shown by the fact that after the heart has stopped with typical digitalis poisoning the respiration continues for a number of minutes.

It is not the purpose of this paper to discuss the twelve-hour frog method at any length, chiefly because the experience of the writer with this method does not permit of any authoritative conclusions regarding it. Logically a larger dose should be required to cause systolic stoppage of the heart of the frog in one hour than is necessary to cause death in twelve hours. Of the heart tonic series, only strophanthus and squill comply with this. In the case of digitalis and convallaria the dose is less by the one-hour than by the twelve-hour method. Of the two frog assay methods, the twelve-hour is the writer's preference, since it takes into account the difference in the rate of absorption, and allows time for the reaction to be completed, and finally the end point (death) is absolutely unmistakable.

According to the experience of this laboratory with the twelve-hour method, more constant results are obtained than with the one-hour frog. This is especially noted in the tests on ouabain where the M. L. D. is always close to .000,000,45 Gm. per Gm. body weight, a fact which has already been verified by other investigators.²

Conclusions.—Conclusions relative to the two methods of biologic assay, which have been discussed in this paper, are for emphasis and conciseness tabulated as follows:

SUMMARIZING COMPARISON OF FACTORS IN BIOLOGIC ASSAYS BY THE ONE-HOUR FROG AND CAT METHODS OF ASSAYING THE HEART TONICS.

| Variable or Constant } affecting the re- sult of assay. | Effect, if any, upon the | |
|------------------------------------------------------------------|-------------------------------------------------------------------|-----------------------------------------------|
| | One-hour frog assay. | M. L. D. cat assay. |
| Concentration of Variable (1) The test solution | Has important effect | Not especially important and negligible |
| (2) Absorption rate | Has important effect | Not important and neg- ligible |
| (3) Seasonal variation | May or may not be im- portant | Not important and neg- ligible |
| (4) Accuracy of ad- ministering dose | Low degree of accuracy, hence important effect | Accuracy high, therefore negligible factor |
| (5) Sex and weight of test animal | Does not affect assay | Does not affect assay |
| (6) So-called "stand- ard" ouabain | Ouabain from different sources variable; im- portant effect | No secondary "standard" used |
| Constants (1) Length of test period | Effect vital to result | Time factor does not enter |
| (2) Temperature at which drug acts | Effect is very important | Temperature factor does not enter |
| (3) Species of test ani- mal | Has been shown to be im- portant by other workers | Species is not a factor |

The above table summarizes the basis for the author's conclusion arrived at after extensive use of both assay methods, namely, that the cat method is capable of greater absolute as well as relative accuracy in biologic assays of the digitalis

series. It has also been pointed out in this paper that the considerations of relative cost, definiteness of the end point and time necessary for making an assay are all in favor of the M. L. D. cat method.

PHIOLOGICAL LABORATORIES OF SHARP AND DOHME,
BALTIMORE, MD., August 1917.

THE CHEMICAL INVESTIGATION OF THE RESINS FROM DATURA METELLOIDES.*

BY CHARLES H. ROGERS.

Comparative amounts of alkaloids, glucosides, neutral principles and other medicinally active plant constituents have to a large degree been the bases upon which the value of vegetable drugs or drug preparations have been established. Tschirch and others have pointed out that vegetable drugs are far from simples as indicated by Galen, but rather that they are exceedingly complex. Pharmacological investigation has shown that the action of isolated principles does not always correspond with the action of the drug itself. Therefore, the pharmaceutical chemist and pharmacologist must pay more attention to the complex ingredients of drugs, or, as they are usually called, "extractives." The term "extractives" used in this connection refers to those supposedly inert materials that are soluble in the menstruum used to dissolve the more important constituents of the drug. Before it is possible to determine the part that these extractives play in the production of the total or composite action of drugs it is necessary to have a clearer chemical and pharmacological understanding of them *per se*. Not only is it of importance to understand their chemistry and pharmacology but it is also necessary that their physical constants in respect to temperature, their susceptibility to enzymic action, etc., must be studied.

It has been shown¹ that preparations made from digitalis which has been dried at a uniformly high temperature (70-90° C.) has an absorption value from 25 to 30 percent greater than preparations made from the commercially prepared article. Knowing that the active constituents of this drug are not vitally affected by ordinary temperatures, it is reasonable to conclude that the extractives have in some way been injured by careless manipulation, and, furthermore, that their alteration may have a decided deleterious effect on the rate of absorption of preparations made from the drug. These same conclusions may have a very important bearing on other vegetable drugs. With these fundamental facts in view, the chemical investigation of the resins (extractives) of *Datura metelloides* was undertaken.

* Read before meeting of Northwestern Branch A. Ph. A., December 5, 1917.

¹ E. L. Newcomb, *St. Paul Medical Journal*, August 1914.

Five hundred grammes of the No. 60 powdered leaves from *Datura metelloides*, 1913 crop, grown in the Medicinal Plant Garden of the University of Minnesota, were moistened with fifty percent alcohol and allowed to macerate for twelve hours. After having packed the moistened drug in a cylindrical percolator, menstruum was added until the liquid began to drop from the lower orifice. Percolation was then discontinued and the whole allowed to macerate for twenty-four hours. The drug was then exhausted of alkaloids as shown by Mayer's reagent. The percolate measured 3380 mls. Fifty percent alcohol was used in the extraction in order that the resins obtained for investigation might be those which would be present in an analogous tincture to that of the U. S. P. IX, *Tinctura Stramonii*.

To the acid tincture thus obtained freshly slaked lime was added until the solution was alkaline to litmus, filtered to remove excess of calcium hydroxide and also the precipitated gums, chlorophyll, etc., and acidulated with dilute sulphuric acid. Three hundred mls of this liquid at a time were placed in a still and the alcohol removed. This operation was conducted on a water bath and at a reduced pressure varying from 350 to 600 millimeters' vacuum. The purpose of reducing the temperature during the distillation of the alcohol was primarily in order that another line of investigation on the alkaloids of *Datura metelloides* might be carried on. This reduction of heat, however, would tend to the least alteration of the constants during extraction of the resin from the crude drug.

The deposited resins were collected, purified and dried in an electric oven for two days at a temperature of 50° C. The total resins from 500 Gm. of drug weighed 13.265 Gm., neutral to litmus, specific gravity, 1.1868 and in color, feel and odor resembled powdered aloes. The percent of soluble resins in the various solvents was then determined and is listed below:

| Ether. | Alcohol. | Chloroform. | Ligroin. |
|--------|-----------------|-------------|----------|
| 35% | 91% | 82.5% | about 1% |
| Water. | Methyl Alcohol. | | Acetone. |
| 5.32% | 86.14% | | 52.64% |

The method employed by A. Tschirch for the proximate analysis of resinous substances was used to classify these particular resins. From previous analyses it has been found that resins are composed of a mixture of compounds and may be classified only by the particular kind of resin which predominates. Tschirch classifies them as ester-resins, acid-resins, resin-alcohols and resenes. The method employed dissolved the resin in ether, but due to only 35 percent of the resins under investigation being soluble in ether, they were dissolved in chloroform. This chloroformic solution was agitated successively with (1) a 1 percent solution of ammonium carbonate, (2) a 1 percent solution of monohydrated sodium carbonate, and (3) solutions of potassium hydroxide of one-tenth and one percent strength, respectively. These reagents dissolved the acid-resins, which were then precipitated from the alkaline liquids with dilute hydrochloric acid. Analysis showed the chloroform-soluble resins to be 33.33 percent acid-resins. These acid-resins or resinolic acids are composed of the characteristic free acids of the original resin and are usually substances of very complex constitution and possess a high molecular weight.

The residue contained the resin-esters, alcohol-resins and resenes. These were separated by saponification with alcoholic potash when the acid radicles of the esters formed soluble potassium salts. It was determined that 54.54 percent of the sample was composed of resin-esters. These esters, as a rule, yield aromatic acids upon saponification and hence are sometimes classed as aromatic balsams.

The resenes and alcohol-resins were then extracted by agitation with ether. This mixture was then boiled for two hours with acetyl chloride under a properly fitted-up reflux condenser, during which process the alcohol-resins were acetylated while the resenes were not affected. The latter were carefully weighed and found to constitute 9.66 percent of the total resin. The results, showing the composition of the chloroform-soluble portion of the original resin, are given below:

| | |
|---------------------|--------|
| Acid-resins..... | 33.33% |
| Ester-resins..... | 54.54% |
| Resenes..... | 9.66% |
| Alcohol-resins..... | 1.84% |
| | <hr/> |
| | 99.37% |

Tschirch distinguished two kinds of resin-alcohols, *viz.*, resinols and resinotannols. The members of the first group are colorless compounds giving no tannin reaction with iron salts, while those of the second group are colored and give a tannin reaction. The resin-alcohols investigated were light amber in color and gave no tannin reaction with a solution of ferric chloride.

Previous investigations have shown resenes to be oxygenated compounds, not acted upon by alkalies and possessing no characteristic chemical properties. They do not appear to be alcohols, esters, acids, ketones or aldehydes.

Combustions were made on two individual samples of the resins with the following results:

| Sample. | Carbon. | Hydrogen. | Oxygen. |
|-----------------------------------|---------|-----------|---------|
| No. 1..... | 69.4% | 9.35% | 21.25% |
| No. 2..... | 68.5% | 9.49% | 22.01% |
| Average..... | 68.95% | 9.42% | 21.63% |
| Empirical formula: $C_6H_{10}O$. | | | |

The analytical characters of the resin from the leaves of *Datura metelloides* are recorded below, also those for its alcohol-soluble, alcohol-insoluble and ether-insoluble portions:

CONSTANTS FOR DATURA METELLOIDES RESIN.

| Resin | Saponification number. | Iodine value. | Acid number. | Ester number. | Ash. | Melting point. |
|------------------------------|------------------------|---------------|--------------|---------------|------|----------------|
| Original resin..... | 221.3 | 85.15 | 61.8 | 159.5 | 0.48 | 90° C. |
| Alcohol-soluble resin..... | 168.4 | 99.86 | 47.04 | 121.36 | 0.23 | 110.5° C. |
| Alcohol-insoluble resin..... | 286.2 | 99.53 | 39.5 | 246.7 | 0.65 | above 217° C. |
| Ether-insoluble resin..... | 315.9 | 97.88 | 141.06 | 174.84 | 0.14 | 149° C. |

The saponification number (number of milligrammes of potassium hydroxide absorbed by one gramme of resin) was determined by boiling a definite weight of the resin with $\frac{N}{2}$ alcoholic potassium hydroxide V. S. for two hours under a reflux and titrating the excess of alkali with $\frac{N}{10}$ hydrochloric acid V. S.

The iodine value (number of grammes of iodine absorbed by 100 Gm. of resin) was estimated by the Hanus method. This method depends upon the fact that

unsaturated fatty acids, as well as their esters, absorb halogens to form mainly addition products. This constant, then, may indicate to what group of unsaturated acids the resin-acids belong. Compared with iodine values of other resins, it checks with that of Elemi resin² of the *Bursera* species, they being 85.15 and 85.1, respectively.

The acid number (expressed in terms of milligrammes of potassium hydroxide required to neutralize one gramme of resin) was obtained by boiling a definite weight of resin for five minutes under a reflux with 90 percent alcohol and titrating the liquid when cold with $\frac{N}{10}$ alcoholic potash V. S., phenolphthalein used as indicator. This constant expresses the amount of free acids present.

The ester number was obtained by subtracting the acid number for the resin from the saponification number and expresses the number of milligrammes of potassium hydroxide that would be required to combine with only the esters present in the resin.

The foregoing methods with their results afford indications of the nature of resinous substances in question, but their use in the positive identification of the various individual commercial resins is a matter of considerable difficulty even when only one resin is present, and in case of an admixture is often impossible. These constants vary and may even be entirely destroyed by aging, heating, etc. J. Lewkowitsch³ has shown that the constants for various resins are absolutely destroyed by heating to 300° C. The saponification numbers, iodine values and acid numbers for the resins under examination checked after being heated to a temperature not exceeding 110° C. for two days. However, the constants for resins, including those obtained from *Datura metelloides*, may be recorded, but it is evident that any definite conclusions as to the value or purity of the resins should be drawn with the greatest care.

COLLEGE OF PHARMACY,
UNIVERSITY OF MINNESOTA.

A WOOL FAT (LANOLIN) SUBSTITUTE AND THE PREPARATION OF CETYLIC ALCOHOL.*

BY SOL. AXELRAD.

The question of substitutes for various materials has been one of prime importance during these war times, especially those substances and chemicals used in medicine and pharmacy. A year and a half ago the supply of wool fat was very limited and the price asked was four times more than that under normal conditions. A substitute called "Eucerin" imported from Germany was also scarce and the agency for this product had only four ounces left. It was claimed that "Eucerin" was made from the washings obtained in the manufacture of wool fat. The uses of lanolin are many, especially in pharmacy; as a vehicle for ointments, in the

² Schmidt and Urban, *J. Soc. Chem. Ind.*, 8, 308, 1889.

³ *Analyst*, 26, 38, 1901.

* Contributed by the author to the *JOURNAL A. PH. A.*, October 18, 1917.

preparation of bougies, suppositories, cold creams and plasters of various kinds, etc.

This investigation on a wool fat substitute was undertaken with the idea of making a fatty composition, which would have all of the desirable properties of lanolin, such as body, tenacity, power of absorbing water readily, taking up solutions of various chemicals used in pharmacy, dry powders, etc., etc.

Liebreich claimed that the absorbing power of wool fat was due to the cholesterin ethers it contained. Lifschuetz¹ isolated the cholesterin ethers of Liebreich and proved that they had very little power of absorbing water. He concluded from his experiments that the absorbing power of wool fat was due to the fatty alcohols of iso- and oxycholesterols. He separated from the alkaline washings of partially saponified wool fat two saturated alcohols and one unsaturated alcohol. His experiments further proved that the more purified lanolin was, the lower was its power to absorb water, owing to the fact that during its purification the iso- and oxycholesterols were partly removed.

Unna,² in his paper, "Ointment Bases," states that "Eucerin" is a mixture of alcohols of the iso- and oxycholesterin group with petrolatum. He does not, however, give a commercial method for the preparation of these alcohols. The absorbing power of "Eucerin" is due to these alcohols, but Roemer (see below) claims that with the employment of cholesterols for ointment bases, hydrocarbons, such as mineral oil, benzol, etc., are essential, for it is due to them in combination that the absorbing property is imparted. Roemer,³ in his paper on "The Pharmacy of the Oxycholesterine Ointment Bases," confirms to a certain extent the work of Unna, but he also fails to give a method for the preparation of the alcohols.

Unna⁴ states that "Eucerin" has been used in skin preparations in Germany, especially in pure form for ichthyosis. According to the U. S. Dispensatory, 19th Edition, page 97, experiments have been carried on in reference to the absorption of wool fat by the skin. Patschkowski and Kaspar claim that the skin readily absorbs lanolin, but Ritter and Pfeiffer in a long series of experiments were unable to verify these results. Grimm⁵ recommends in his paper "*Ueber die Verwendung von Aethyl in der Hautpflege*," cetyl alcohol for skin preparations on account of its absorption by the skin and he further states that he has found it useful in the treatment of prurigo, weeping eczema and other skin infections.

In view of the fact that Unna and Roemer have written about the cholesterols, which are aliphatic higher alcohols, and Grimm has given a favorable report on the use of cetyl alcohol, the writer came to the conclusion that the use of this alcohol was advantageous in a substitute for wool fat.

A review of the literature failed to show any commercial method for the preparation of cetyl alcohol. There are many references as to its preparation from spermaceti by saponification with caustic potash and shaking the aqueous soap solution with petroleum ether, this being analogous to the extraction of unsaponifiable matter. Spermaceti is essentially the cetylic ester of palmitic acid. Chevreul, in 1818, isolated the alcohol by the above method. Krafft⁶ prepared this substance by the reduction of palmitic acid to the aldehyde and heating it with barium formate. He also made the alcohol^{7,8} by heating the palmitic aldehyde with zinc dust and acetic acid and hydrolyzing the acetate formed.

Levene⁹ made this alcohol by the reduction of ethyl palmitate with sodium and absolute alcohol. Schorlemmer¹⁰ distilled a dry mixture of barium oxide with sebacic acid. A method given in several text-books for the preparation of cetyl alcohol was the saponification of spermaceti with an alcoholic potash, evaporating the alcohol, taking up the residue with water, adding calcium chloride solution to form calcium soap and extracting with suitable solvents. The above methods are useful for preparing small quantities of cetyl alcohol, but for commercial quantities these methods fall down for obvious reasons.

The method of Schorlemmer was found impracticable on account of sebacic acid not being a commercial substance. The extraction process causes a considerable loss of the solvent employed and formation of troublesome emulsions.

It has been found that cetyl alcohol distils at about 340–350° C. without decomposition and the writer's method is based upon the distillation of the calcium soap of spermaceti. Various experiments were performed with the following purposes in view: 1. Greatest yield of cetyl alcohol. 2. Cheapest process. 3. Most practical method.

Experiment I.—Spermaceti (20 Gm.) was saponified with alcoholic potash, the alcohol evaporated and the residue heated in a distilling flask to 340° C.

Experiment II.—Spermaceti (20 Gm.) was saponified with alcoholic potash, the alcohol evaporated and the soap dissolved in water. To the soap solution was added excess of a 10 percent calcium chloride solution. The calcium soap was separated and dried at 100° C. and finally distilled at 340° C.

Experiment III.—The method employed was the same as in Experiment II, except that the soap solution was saturated with sodium chloride. The soap was filtered, dried at 100° and distilled. Many minor experiments were performed by Method III, but they did not show results of such value as to warrant their description.

Experiment IV.—Twenty grammes of calcium oxide containing about 5 percent water were added to 15 grammes of melted spermaceti. The mixture was heated for about six hours, with occasional stirring. When cooled, the mass assumed a brown-yellow color. On distilling same, frothing occurred at 100° C., due to the escape of water. When the water had all been driven off the temperature was raised to 340° when the cetyl alcohol distilled as white fumes and on cooling formed oily drops, which became pure white upon solidification, the melting point being 49.5° C. The yield obtained was over six grammes, this being over 40 percent of the actual spermaceti taken. The theoretical yield (calculated) was about 45 percent.

This method gave a larger yield than the other three preceding methods, and, calculating the cost of the alcohol obtained on a 40 percent basis, was also cheaper in this method. The ideal temperature for the distillation of cetyl alcohol is 330°–350°, as above this temperature a yellow liquid distils, being strongly acid and having a pungent odor; its value commercially will be investigated at a later date.

A copper still, manufactured by Sargent & Co., Chicago, for the distillation of oils, etc., at high temperatures, was found to be of most service. Glass stills are apt to crack, due to the "caking" of the residue which can readily be removed from the copper still, after each distillation.

Mixtures were made having different quantities of base, cetyl alcohol, lanolin and water. The formula finally selected as being the best suitable for pharmaceutical compounding was the following: 70 parts petrolatum, 20 parts paraffin (m. p. about 60° C.), 10 parts cetyl alcohol, 5 parts lanolin (anhydrous), 100 parts water. This preparation stood in the laboratory for 17 months with absolutely no change in appearance or working qualities. The properties of this mixture are the same as wool fat, that is, taking up solutions of salts, powders, etc., etc. The advantage over wool fat is that it will not become rancid and is considerably cheaper. The reason for using 5 parts of lanolin in the mixture was to have the "unctuous" property of wool fat. This, however, is a minor physical property.

A cold cream having very desirable properties can be made by using the above formula except for the addition of 250 parts of water instead of 100. The method of mixing the various substances is of prime importance. The petrolatum, alcohol, lanolin and paraffin are melted together. The water is warmed to the same temperature as the melted fats and added slowly with constant grinding so as to get a smooth mixture.

Microphotographs of hydrous wool fat, the substitute, and cold cream have been taken and are shown below.

FIG. I.—HYDROUS LANOLIN.
(Wool fat with 30 percent water.)
Average cost per pound, 40 cents.

FIG. II—WOOL FAT SUBSTITUTE.
55 to 75 percent cheaper than
hydrous lanolin.

FIG. III.—COLD CREAM.
80 to 90 percent cheaper than
hydrous lanolin.

The writer believes that the wool fat substitute described in this paper will stand competition with wool fat and "Eucerin," both now and under normal conditions.

A further investigation is under way to determine the value of ceryl alcohol, $C_{27}H_{55}OH$, from Chinese wax and myricyl alcohol, $C_{30}H_{61}OH$, from Carnauba wax for the same purpose for which cetyl alcohol, $C_{16}H_{31}OH$, from spermaceti was put to, namely, in the preparation of a wool fat substitute.

In conclusion, due credit is hereby given to Mr. Sol. Bernstein, who spent considerable time in performing experiments and assisting in general to bring this paper to a successful issue.

METHODS OF ANALYSIS OF ACETYSALICYLIC ACID AND ADULTERANTS.

BY HENRY L. SCHULZ.

With the collaboration of C. K. Glycart, A. W. Hanson and A. E. Stevenson.

In the spring of 1915, about ten months after the outbreak of the European war, the supply of acetylsalicylic acid was practically exhausted. The stocks still held by a few dealers were being offered at an advance of about two hundred per cent above the market price of the previous year. Owing to the scarcity of synthetic drugs of foreign origin, the "drug peddlers" and "drug brokers" who had been dealing in these products were unable to supply the demand and, not wishing to lose an opportunity to profit by the advanced prices, resorted to unscrupulous methods to obtain material for their trade.

Information that acetylsalicylic acid was being adulterated reached the Department in the early part of June 1915. An investigation was begun and samples collected and analyzed. These samples, mostly tablets, showed a marked variation in composition. Some were pure acetylsalicylic acid, others contained only small amounts, and a number did not contain any. As the combinations of substances found in the spurious samples differed widely, it was concluded that several manufacturers were adulterating acetylsalicylic acid, and steps to locate them were immediately taken. After some difficulty, consignments of spurious acetylsalicylic acid were found to have originated in Cleveland, Indianapolis, Memphis, St. Louis and Chicago. For the purpose of hiding their identity and to make it more difficult to trace shipments, some of these adulterators would use fictitious shippers' names and addresses on the packages sent out by them.

Previous to 1917, before the patent on acetylsalicylic acid expired, its sale was restricted in this country, and reputable wholesale druggists refused to handle it except under the trade name "Aspirin." As stated above, most of the acetylsalicylic acid was sold by drug brokers and peddlers who frequently carried their entire supply in a trunk or suitcase and disposed of it in such quantities as the druggist or dealer might wish to buy. A number of the shipments sent to brokers and peddlers by these adulterators were located and immediately confiscated by inspectors of this Department. The investigation showed that some of these manufacturers would deliver the unlabeled, spurious mixture to manufacturing pharma-

ceutical houses to have it compressed into tablets, while others would do their own compressing. The extent to which this fraud was perpetrated can be estimated when it is considered that one of these adulterators sold over twelve hundred pounds of this product in one month. This same manufacturer did not confine his activities to acetylsalicylic acid, but also made adulterated ichthyol, creosote, carbonate, potassium guaiacol, sulphonate, etc., samples of which were collected and analyzed. Most of these unscrupulous manufacturers have already been tried and convicted in the United States Courts, and several were sentenced to serve a term in prison.

During this investigation scores of samples of acetylsalicylic acid were collected and analyzed. While many of these were pure, the majority consisted of one of the following combinations:

1. Acetanilid or acetphenetidin, citric acid, salicylic acid, and milk sugar.
2. Acetanilid, salol, salicylic acid, and milk sugar.
3. Acetylsalicylic acid, milk sugar, and starch. (The tablets contained only 20 percent of the amount declared.)
4. Milk sugar, alum, and acetanilid.
5. Acetylsalicylic acid and salol.
6. Milk sugar, starch, and calcium acid phosphate.
7. Tartaric acid, milk sugar, and boric acid, both with and without acetanilid.
8. Acetanilid and tartaric acid.
9. Milk sugar, cream of tartar, and salicylic acid.
10. Milk sugar and cream of tartar.

Owing to the variation in composition of these samples, the usual methods for examining acetylsalicylic acid could not always be followed. Therefore special methods were compiled for the qualitative and quantitative analyses of the different combinations. These are given below.

Acetylsalicylic acid usually occurs in the form of colorless crystalline needles with an acidulous taste. It is soluble in 100 parts of water and freely soluble in alcohol, ether and chloroform. Its melting point is usually given as 135° C. A number of apparently pure samples were found to melt as low as 130° C.

QUALITATIVE TESTS.

Since many samples contain a very high percentage of chloroform-insoluble material, better results will be obtained by applying the qualitative tests to the chloroform-soluble substances and chloroform-insoluble substances after they have been separated. The taste of the insoluble residue will readily indicate sucrose, acids, or acid salts if present.

Free Salicylic Acid.—Shake 0.5 Gm. of the sample with 10 Cc. of cold water and filter the liquid. Add a drop of dilute ferric chloride solution to the filtrate. This should not produce more than a very faint violet color. If boiled with water for several minutes acetylsalicylic acid is hydrolyzed and the addition of ferric chloride to the filtrate will produce a deep violet color characteristic of salicylic acid.

Salicylic Acid and Salol. Boil 0.5 Gm. of the sample with 10 Cc. of normal sodium hydroxide for two minutes, cool, and add an excess of dilute sulphuric acid. Acetic acid will be liberated and delicately violet-colored crystals of salicylic acid will be precipitated. These crystals, when washed and dried, should melt at 157° . If phenyl salicylate (salol) is present, the odor of phenol will be recognized on acidifying. Salol may frequently be recognized by its characteristic odor.

Acetanilid.—Heat 0.2 Gm. of the sample with 5 Cc. of a ten percent solution of potassium hydroxide; then add 0.1 Cc. of chloroform and again heat. The odor of phenylisocyanide should not be evolved.

Acetphenetidin.—Heat 0.2 or 0.3 Gm. of the sample with 10 Cc. of dilute nitric acid. If an intense yellow color develops, acetphenetidin is indicated.

Sugars, Starch or Salts.—0.5 Gm. of the sample should be completely soluble in 15 Cc. of chloroform or alcohol.

Test any chloroform-insoluble residue for starch with iodine.

The presence of lactose is indicated (a) if a yellow color develops on boiling a 0.5 Gm. sample with potassium hydroxide solution, (b) if a water solution of the chloroform-insoluble residue reduces Fehling's solution.

Inorganic Impurities.—Shake two Gm. of the sample for several minutes with 25 Cc. of water, filter and test separate portions of the filtrate for metals, chlorides, sulphates, carbonates, borates and phosphates, according to the usual qualitative methods prescribed for these substances in the Pharmacopoeia, or other standard books.

QUANTITATIVE METHODS.

Substances Determined in the Original Sample.

Ash.—The residue of the ignited powder should not be over 0.2 percent. (On compressing acetylsalicylic acid into tablets some inert binding and lubricating materials are generally added which may increase the ash.)

Acetylsalicylic Acid.¹—The following double titration is very satisfactory when examining pure acetylsalicylic acid or tablets containing the usual excipients sugar, starch and talc, since these substances do not interfere with the titration. In the presence of acids, acid salts, salol, etc., the method is not satisfactory.

Weigh 0.3 Gm. of the finely powdered material into an Erlenmeyer flask, dissolve as quickly as possible in about 10 Cc. of cold neutral alcohol (95 percent), add a drop of phenolphthalein solution, and titrate with $\frac{N}{10}$ potassium hydroxide. Note the volume of $\frac{N}{10}$ alkali required, then add a volume of the alkali equal to that required for the first titration plus 5 Cc., and place the solution on a steam bath for 15 minutes. Titrate the excess of alkali with $\frac{N}{10}$ acid.

If the product is pure the total amount of alkali required should be twice that of the first titration. Each cc. of $\frac{N}{10}$ alkali is equivalent to 0.009 Gm. acetylsalicylic acid.

If free acids are present, the amount of acetylsalicylic acid may be calculated by multiplying the number of Cc. of $\frac{N}{10}$ alkali required for the second or hot titration by 0.018.

The cold titration should be made with as little delay as possible since the acetylsalicylic acid hydrolyzes very rapidly liberating acetic and salicylic acid, which would require more alkali to neutralize than the original substance. If salol is present the odor of ethyl salicylate will be noticed after heating the alcoholic mixture.

Total Salicylates.²—Dissolve 1 Gm. of the material in a slight excess of dilute alkali, heat on a steam bath for 15 minutes, then carefully transfer to a separatory funnel, acidify with hydrochloric acid, and extract with from 3 to 5 25-Cc. portions of chloroform to remove all traces of salicylic acid from the mixture. Treat each portion of chloroform extract in succession in a second separator with 20 Cc. of water containing 1 Gm. of anhydrous sodium carbonate for every 100 mg. of salicylic acid to be neutralized. Shake the solutions vigorously, and after separating the layers wash each portion of chloroform in another separator with 5 Cc. of water. On completion of this operation, unite the water layer with the main aqueous soda solution. Dilute the alkaline solution to a known volume, transfer an aliquot representing about 100 mg. of salicylic acid, to a 200 Cc. Erlenmeyer flask, and dilute to about 100 Cc. Heat the solution nearly to boiling; then add from a burette 25 to 40 Cc. of strong (about $\frac{N}{3}$) iodine solution, sufficient to insure an excess of this reagent during digestion and heat the mixture for an hour on the steam bath. Discharge the free iodine with a few drops of thiosulphate solution, decant the clear liquid

through a tared Gooch filter, care being taken that most of the precipitate remains in the flask. To the latter add 50 Cc. of boiling water. Digest for 10 minutes on the steam bath; then filter, gradually washing all the reddish substance into the Gooch filter with 200 Cc. of hot water, dry at 100° and weigh. Multiply the weight of precipitate by the factor 0.4016 to obtain the quantity of salicylic acid present in the aliquot.

Substances Soluble in Chloroform.—Separation of constituents (in mixtures containing sugar, inorganic salts, salicylic acid, acetphenetidin, and acetanilid, with little or no acetylsalicylic acid).

Accurately weigh 2 or 3 Gm. of the finely powdered sample into a counterpoised filter, and wash it with successive small portions of chloroform to extract all the soluble substances. The last portion of the chloroform should be dropped along the upper edge of the filter to remove any crystals which may have formed. Collect the solvent in a tared dish, evaporate at 60°, dry and weigh the residue, redissolve in 10 Cc. of cold 95% alcohol, add a drop of phenolphthalein solution, and titrate with $\frac{N}{10}$ alkali. Calculate the acidity as salicylic acid. Add an excess of 0.5 Cc. of $\frac{N}{10}$ alkali, and heat on a steam bath for 2 or 3 minutes. If the solution is partly or completely decolorized, acetylsalicylic acid or salol is indicated. (Salol will produce ethyl salicylate, which is readily detected by its wintergreen like odor.)

Transfer the titrated solution to a separatory funnel, using 20 Cc. water and 25 Cc. of chloroform to wash the dish. Then add about 10 Cc. of 1% potassium hydroxide solution, shake, and when the two liquids have separated, carefully transfer the chloroform to another separator. Repeat the extraction twice, using 15 and 10 Cc. chloroform. Filter the chloroform into a tared dish, evaporate, dry and weigh. This residue contains the acetphenetidin, acetanilid, and salol.

Combine the aqueous washings and reserve for the determination of total salicylates. The melting point of the chloroform residue should be determined and other tests that may be necessary to identify the residue should be made. Acetanilid melts at 115°, acetphenetidin at 135°, and salol at 42°.

Acetanilid and acetphenetidin may also be determined by the following methods:

*Acetanilid.*³—Transfer 0.30 Gm. of the chloroform-soluble residue redissolved in chloroform to a 200 Cc. flask, add 10 Cc. of dilute sulphuric acid (1 to 10 by volume), and heat on a steam bath until the volume is reduced to 5 Cc. If the odor of acetic acid is present, add 10 Cc. of water and continue the digestion until the liquid is again reduced to 5 Cc.; then cool, transfer to a separatory funnel with water, so that the final volume does not exceed 20 Cc. Add 30 Cc. of chloroform, shake the mixture gently for 1 minute and, after the layers have separated, withdraw the lower layer through a small dry filter. Repeat the extraction with 20 and 15 Cc. chloroform. Discard the chloroform and carefully draw off the aqueous acid solution remaining in the separator into an Erlenmeyer flask. Rinse the filter and funnel with several 5 Cc. portions of water to remove all traces of the former contents. Heat the liquid on a steam bath for 10 minutes to expel the chloroform. After cooling, add 10 Cc. of concentrated hydrochloric acid. Run in gradually, and with frequent shaking, a standard solution of potassium bromide-bromate until a faint yellow color persists. From the amount of standard solution required calculate the percentage of acetanilid in the chloroform-soluble residue, as well as in the original mixture.

The standard bromide-bromate solution is prepared as follows: Dissolve 50 Gm. of potassium hydroxide in a small quantity of water. Add a slight excess of bromine, dilute with water to dissolve any separated salts, boil to expel excess of bromine, and dilute to 1 liter. Standardize the solution against well-dried, recrystallized acetanilid, adjusting the solution so that each Cc. is equivalent either to 5 or to 10 mg. of acetanilid.

*Acetphenetidin.*³ Proceed as directed under "Acetanilid" up to and including the extraction of the hydrolyzed acid mixture with chloroform. Treat the aqueous acid solution of phenetidin sulphate remaining in the funnel with successive small portions of solid sodium bicarbonate until an excess of the former persists at the bottom of the mixture. Add 50 Cc. of chloroform

and, for every 100 mg. of acetphenetidin present, 5 drops of acetic anhydride. Shake the mixture vigorously for some time, allow the layers to separate, and withdraw the chloroform into a second separator containing 5 Cc. of water. Shake this mixture, and after separation pass the lower layer through a small dry filter into a 200 Cc. Erlenmeyer flask. Distil over about 40 Cc. of the chloroform, using the distillate for further extraction. Make a second and third extraction of the original aqueous solution and wash and distil as before. Completely transfer the chloroform residue to a tared 50 Cc. crystallizing dish or beaker, evaporate on the steam bath to apparent dryness, and finally remove any considerable excess of acetic anhydride by repeated additions of 1 Cc. of fresh chloroform to which has been added a drop of alcohol.

The regenerated acetphenetidin should finally appear as a white, crystalline mass, with a faint acetous odor. The latter will completely disappear on standing some hours in the open or in a vacuum desiccator over lime. Weigh the residue from time to time until the final weight differs from the preceding not more than 0.05 mg.

*Salol.*⁵—If salol is substituted for acetylsalicylic acid, its presence is readily detected in the chloroform-soluble residue by qualitative tests, odor, and by the melting point ($42^{\circ}\text{C}.$). In mixtures containing salol, acetanilid, or acetphenetidin, the salol may be determined by difference or by titration with standard bromide-bromate solution.

1. *Salol by Difference.*—In 0.3 Gm. of the chloroform residue determine the amount of acetanilid or acetphenetidin by acid hydrolysis as directed in the methods for acetanilid. To determine the amount of salol, subtract the weight of acetanilid or acetphenetidin found from the weight of chloroform residue taken.

2. *Salol by Alkaline Hydrolysis.*—Heat the chloroform-soluble residue from 1 Gm. sample with 20 Cc. of 2.5 percent caustic alkali on a steam bath for 10 minutes, cool and transfer quantitatively to a separatory funnel. Extract the solution with four 30 Cc. portions of chloroform. Discard the chloroform and transfer the alkaline solution from the separatory funnel into a 200 Cc. graduated flask. Wash the funnel, add the washings to the flask, and make up to the mark with water. Take an aliquot representing not more than 75 mg. salol, add an excess (about 45 to 50 Cc.) of standard bromide-bromate solution, and follow this with 10 Cc. of concentrated hydrochloric acid. Close the flask and shake 1 minute; then shake at intervals over a period of $\frac{1}{2}$ hour. At the end of this time add 10 Cc. of 15 percent potassium iodide solution, agitating the closed flask at intervals for 15 minutes. Titrate the free iodine with standard thiosulphate previously adjusted to the standard bromine solution, 1 Cc. of which is equivalent to 0.001784 Gm. salol. From the number of Cc. of standard bromine solution required, calculate the salol on the basis of 12 atoms of bromine to 1 molecule of salol.

If salicylic acid also is present the amount should be determined on a separate portion of the chloroform-soluble residue by dissolving a known weight of the residue in 10 Cc. of alcohol, adding 10 Cc. of water and 2 drops of methyl red indicator, and titrating with $\frac{N}{10}$ alkali. One Cc. of $\frac{N}{10}$ alkali represents 0.0138 Gm. salicylic acid. The amount of salicylic acid found, as well as the amounts of acetphenetidin or acetanilid found, should be subtracted from the weight of the residue taken, if salol is determined by difference.

If Method 2 is used in the presence of salicylic acid the quantity of standard bromide-bromate solution required for the salicylic acid must be deducted before the amount of salol is calculated.

SUBSTANCES INSOLUBLE IN CHLOROFORM.

The chloroform-insoluble residue remaining on the filter paper after the original extraction with chloroform is allowed to dry in the air. It is weighed and is

then washed with water until all water-soluble matter has been removed. The residue on the filter consists of starch, talc, etc., while in the aqueous solution the following adulterants, if present, will be found:

Alum, boric acid and salts, citric acid and salts, tartaric acid and salts, phosphates, and milk sugar.

Make the solution to a known volume and in aliquots determine:

Acidity

Reducing sugars

Phosphoric acid

Alum

Citric acid

Tartaric acid

according to methods outlined in Leach "Food Inspection and Analysis," John Wiley & Sons, or *Journal of the Association of Official Agricultural Chemists* (1916), "Methods of Analysis," Williams & Wilkins Co., Baltimore.

PRACTICAL PHARMACY SECTION

EMERGENCY SUBSTITUTES FOR SUGAR, SYRUP AND GLYCERIN.*

BY CURT P. WIMMER.

In bringing the subject of emergency substitutes for sugar, syrup and glycerin before you at this time, I hope that no one will take from this paper the impression that I advocate the illegitimate use of substitutes in any manner, shape or form. The word "substitute" has an unpleasant flavor in American pharmacy and the "substitutor" in normal or abnormal times is an unprincipled scoundrel who fully deserves whatever punishment the law provides for him.

Neither do I desire to appear before you as an alarmist who proclaims that sugar and glycerin will shortly disappear from the market or that their use for medicinal purposes will be prohibited by the government. On the contrary, I have entire confidence that our government will at all times see to it that a moderate supply will be available for medicinal uses.

This paper is written with only *one* object in view, and it is the following: Our country is engaged in a great war, in a war which requires that all of our resources be mobilized and strained and used for the successful prosecution of the conflict. It is the first duty of every good and loyal citizen to support the government, heed its warnings and to coöperate to the best of his ability. We are at present in the midst of a scarcity of sugar. The government has asked us to use as little of it as possible, so as to insure at least a moderate supply wherever it is needed most urgently. Glycerin also is becoming more and more scarce, a fact evidenced by the slow but steady increase in price for this substance. What, then, can the pharmacist do to assist the government? Can he get along with less sugar and glycerin in his preparations? Can he do without them altogether? What substances or preparations might possibly be used to advantage in their places?

It is the object of this paper to answer these questions. For purposes of simplicity, the paper is sub-divided into two parts, *viz.*, (1) Sugar and Syrup Emergency Substitutes, and (2) Glycerin Emergency Substitutes, and under each heading will be included a brief review of relevant conditions and means of meeting them, as found in some of the other warring countries. Most of the information regarding the latter has been gained by a careful perusal of recent foreign publications, especially of *The Chemist and Druggist* of London.

Another fundamental question must be answered: Are the quantities of sugar and glycerin used in compounding medicines so large, that their continued unrestricted use for this purpose might become embarrassing to the food administrators? Without hesitation I say "Yes." To my regret, I have no statistics available giving the amount of sugar or of glycerin used by the pharmaceutical profession

*Read before New York Branch A. Ph. A., December meeting, 1917.

and the drug trade, but no doubt it is very large. And furthermore, much of it, I believe, can be saved to be used either to feed the mouths of the hungry, or to be made into explosives.

About three months ago, the General Council of Medical Education of England have, by authority vested in them, altered and amended the British Pharmacopoeia and have withdrawn seventy-three preparations, with only one object in view: to save sugar and glycerin. The following preparations have been made unofficial:

- (1) All Confections (except pepper and rose)
- (2) All Glycerites
- (3) All Mixtures (except chalk, compound iron and castor oil mixtures)
- (4) All Syrups (except syrupus, chloral, codeine phosphate, iron iodide, iron phosphate with quinine and strychnine, glucose)
- (5) All Troches (except krameria, cocaine, morphine, morphine and ipecac)

Also: Effervescent Citrated Caffein
Compound Decoction of Aloes
Saccharated Solution of Lime
Honey and Borax
Compound Almond Powder
Compound Licorice Powder
Suppositories of Glycerin
Compound Tincture of Cardamom
Tincture of Kino
Tincture of Wild Cherry
Comp. Tincture of Rhubarb
Comp. Tincture of Senna
Ointment of Iodine.

Surely this momentous action would not have been taken, had not actual experience shown its advisability. We may well take a lesson from countries who have been in the war longer than we have been. The withdrawal of these preparations has opened up a number of interesting questions. One of them was to the effect that, legally, this withdrawal made automatically official the older formulas which had been superseded by those withdrawn. Another point raised was that all of these important preparations were, by this withdrawal, left without any standard of any kind, a prey for the unscrupulous. The Council recently announced that they would publish substitute formulas to be used in place of the official ones, and a pamphlet regarding them is probably in the hands of the English pharmacists by this time.

The English pharmacist does, of course, not dispense any of these preparations without affixing to the container a label, showing the words "War Emergency Formula," followed by a statement to the effect that although the formula of the preparation has been changed, its physiological activity has in no wise been altered. At the same time, physicians are being requested to cease prescribing the deleted galenicals.

In our own Pharmacopoeia, sugar and glycerin are made use of in many preparations. They are, in part, the following:

| | |
|-----------------------------------------------------|-------------------------------------------------------------------|
| Compound Licorice Powder contains..... | 50 $\frac{C}{100}$ sugar |
| Compound Chalk Powder contains..... | 50 $\frac{C}{100}$ sugar |
| Aromatic Elixir..... | 31.8 $\frac{C}{100}$ sugar |
| Saccharated Ferrous Carbonate..... | 70 $\frac{C}{100}$ sugar |
| Aromatic Fluidextract Cascara Sagrada contains..... | 20 $\frac{C}{100}$ volume glycerin |
| Glycerites: Tannic Acid..... | 80 $\frac{C}{100}$ weight glycerin |
| Starch..... | 80 $\frac{C}{100}$ weight glycerin |
| Boroglycerin..... | 69 $\frac{C}{100}$ weight glycerin |
| Hydrastis..... | 50 $\frac{C}{100}$ volume glycerin |
| Phenol..... | 80 $\frac{C}{100}$ volume glycerin |
| Solution Magnesium Citrate..... | 14.5 $\frac{C}{100}$ w/v sugar |
| Mass of Ferrous Carbonate..... | 25 $\frac{C}{100}$ sugar |
| Mucilage of Tragacanth..... | 18 $\frac{C}{100}$ weight glycerin |
| Suppositories of Glycerin about..... | 85 $\frac{C}{100}$ weight glycerin |
| Syrups: Acacia..... | 80 $\frac{C}{100}$ sugar |
| Citric Acid..... | 70 $\frac{C}{100}$ sugar |
| Hydriodic Acid..... | 57.50 volume syrup |
| Orange..... | 82 $\frac{C}{100}$ w/v sugar |
| Orange Flower..... | 85 $\frac{C}{100}$ w/v sugar |
| Calcium Lactophosphate..... | 65 $\frac{C}{100}$ w/v sugar |
| Ferrous Iodide..... | 57.5 $\frac{C}{100}$ weight sugar |
| Hypophosphites..... | 60 $\frac{C}{100}$ w/v sugar |
| Ipecac..... | 70 $\frac{C}{100}$ w/v sugar + 10 $\frac{C}{100}$ volume glycerin |
| Lactucarium about..... | 65 $\frac{C}{100}$ w/v syrup + 20 $\frac{C}{100}$ volume glycerin |
| Tar..... | 85 $\frac{C}{100}$ w/v sugar |
| Wild Cherry..... | 80 $\frac{C}{100}$ w/v sugar |
| Rhubarb..... | 85 $\frac{C}{100}$ volume syrup |
| Rhubarb Aromatic..... | 85 $\frac{C}{100}$ volume syrup |
| Sarsaparilla Compound..... | 75 $\frac{C}{100}$ volume syrup |
| Squill..... | 80 $\frac{C}{100}$ w/v sugar |
| Squill Compound..... | 83 $\frac{C}{100}$ volume syrup |
| Senega..... | 80 $\frac{C}{100}$ volume syrup |
| Senna..... | 75 $\frac{C}{100}$ volume syrup |
| Tolu..... | 82 $\frac{C}{100}$ w/v sugar |
| Ginger..... | 82 $\frac{C}{100}$ w/v sugar |
| Tinctures: Gentian Compound..... | 10 $\frac{C}{100}$ volume glycerin |
| Lactucarium..... | 25 $\frac{C}{100}$ volume glycerin |
| Rhubarb..... | 10 $\frac{C}{100}$ volume glycerin |
| Rhubarb Aromatic..... | 10 $\frac{C}{100}$ volume glycerin |
| Troches: Acid Tannic..... | 80 $\frac{C}{100}$ sugar |
| Ammonium Chloride..... | 50 $\frac{C}{100}$ sugar |
| Potassium Chlorate..... | 80 $\frac{C}{100}$ sugar |
| Sodium Bicarbonate..... | 65 $\frac{C}{100}$ sugar |
| Ointments: Acid Tannic..... | 20 $\frac{C}{100}$ weight glycerin |
| Iodine..... | 12 $\frac{C}{100}$ weight glycerin |

This list is not given for the purpose of recommending the deletion of some of the formulae for the period of the war, although some such step may yet have to be taken, if the present scarcity of sugar continues, or if the supply of glycerin be withdrawn from the open market. But the list shows to what extent sugar and glycerin are used in galenical pharmacy. Add to this the amount of sugar used in the numberless proprietary remedies and you will have an idea of the total used for medicinal purposes.

In discussing various substitutes, let us not forget that they cannot be reasonably expected to be the equal in all respects of the substance they are to replace.

Sugar and glycerin owe their general use to the fact that they each have a number of valuable and divers properties, which make them so useful to us. A substitute for sugar, for example, cannot be expected to have *all* of the physical and chemical properties of sugar. If, however, we succeed in devising a preparation which, in a *given galenical*, will satisfactorily replace the sugar, then the substitute must be called a success. So, for different classes of galenicals, or even for certain individual preparations, different substitutes may have to be used. The nature of the substitute will depend entirely, in each case, upon the especial property of the sugar or glycerin which we desire to impart.

In England, the wholesale manufacturing as well as the retail pharmacist must make application to the local food controller for a sugar supply for the coming year. This application must be made on special blanks, which require the following information: 1—Class of manufacture. 2—Stock of sugar on hand. 3—Amount of sugar used in 1915. 4—Quantity applied for. 5—Usual supplies. 6—Remarks.

At this writing the food controller had allowed to manufacturing pharmacists 50 per cent of the total amount used by them in 1915.

1. SUGAR AND SYRUP EMERGENCY SUBSTITUTES.

In arranging the various properties of sugar according to their relative importance, in medicinal preparations, I should unhesitatingly say that, first, sugar is used because of its taste, second, because it preserves, third, because it imparts consistence or bulk, and, lastly, because it has a slight physiologic action. For purposes of substitution the last-named property must at once be discounted, since the sugar of a preparation depending in its physiological action solely upon this substance simply cannot be replaced by anything else. Such "medicines" I will exclude from consideration here. To impart to preparations a sweet taste, nothing is more suitable than saccharin.

Saccharin, or O-sulphamino benzoic acid anhydride,  SO_2
 $\text{CO} > \text{NH}$, discovered

accidentally by Fahlberg in 1878, is a microcrystalline powder, soluble in water 1 : 290, melts at 220° C. It is about 500 times sweeter than sugar, and, therefore, at least as cheap as sugar if it can be bought for about \$40 a pound. The price of saccharin to-day is quite unsettled, but the amount of the substance that might be used in medicinals would be so small that the matter of cost would hardly play an important part. I believe that saccharin will come into its own through this war. In spite of the reports of eminent authorities that saccharin is harmless if taken in small quantity, this substance has become almost an outlaw in many countries. No doubt, economic and political considerations had something to do with the making of the laws against its use, but such considerations do not hold now and the question of a limited use of this substance in galenicals might well be discussed. Professor Joachimoglu, of the University of Berlin, is reported to have recently stated that after extensive experiments and observations during this war, he is convinced that saccharin is harmless. Professor E. R. Watson, of the University of Leeds, recommends its use in solution. In the city of Manchester, signs in various shops advertise saccharin as being "better and cheaper" than sugar. The Italian government permits the sale of an artificial sugar, a dilution

of saccharin 6 to dextrose 1000, in the pharmacies. Unfortunately, a vicious rumor has been spread in certain Italian localities among the ignorant, that this artificial sugar may cause cancer, and so the pharmacists are having a hard time trying to dispose of it.

Very recently, the *Société de Thérapeutique* of France passed resolutions requesting the government to permit the use of a saccharin-dextrose mixture, 1 : 1000, for sweetening purposes. It is, however, not to be used in jams, chocolates and other articles of food.

I might also direct your attention to the report on saccharin of the Referee Board of the American Medical Association. This report shows that saccharin in small quantities, 0.3 Gm. per day or less, is without deleterious or poisonous action, that in larger quantities, especially over 1 Gm. per day, when taken for a considerable period of time, it is liable to produce disturbances of digestion. Again I ask that my position in this matter be not misunderstood. I believe that under no circumstances should the use of saccharin be permitted in any preparation which depends for its use entirely or in part, upon the presence of sugar, especially in those used as a food.

The property of syrup of lending consistency and, in more limited degrees, of preserving, may well be imparted to galenicals by glucose, or similar substances, such as honey, invert sugar, marmalade or molasses, or mixtures of these. The proposition most frequently met with in English current publications is to take glucose, dilute it with water to the specific gravity of syrup, 1.313, then to boil and strain and to add some chloroform. This preparation is claimed to keep for months.

Acting upon this suggestion, I procured some liquid glucose and diluted it to the desired specific gravity, but found that the viscosity of this preparation was very much higher than that of the U. S. P. syrup. Inasmuch as the specific gravity seemed to me a less desirable standard to use than viscosity, I prepared several mixtures of glucose and water and by the aid of Engler's viscosimeter established that a mixture of 66 $\frac{2}{3}$ percent by volume of glucose with water at 25° C. has approximately the same viscosity, or fluidity, as the official syrup. Next, I procured some Karo syrup (Crystal White brand) of the Corn Products Manufacturing Company, and established by a series of experiments that a mixture of 75 percent of this Karo with 25 percent (by volume) of water, at 25° C. has a viscosity practically the same as that of official syrup. With the kind assistance of some of our students, a series of taste experiments was carried out, with a view of establishing the relative sweetness of the various syrups. Dilutions ranging from 1 : 10 up to 1 : 200 were prepared and the concentration at which the sweet taste was first tasted distinctly, was determined. We found the following ratio:

Syrup, U. S. P., taste appears in dilution 1 : 110.

Glucose, 66 $\frac{2}{3}$ percent volume, taste appears in dilution 1 : 25.

Karo, 75 percent volume, taste appears in dilution 1 : 35.

Taking the sweetness of official syrup as one, it appeared that the glucose preparation was 0.227 and the Karo preparation 0.32 as sweet.

Glucose is rated to be about one-third as sweet as sugar, and basing upon this ratio, and, furthermore, upon the ratio 1 : 500 for relative sugar-saccharin sweetness, I expected that about 1.20 Gm. of saccharin would have to be added to every 1000 mls of glucose syrup to get the same relative sweetness as that of official syrup. We found, however, that sweetness cannot, with safety, be calculated by a rule of

mixtures. On making dilutions and tasting them, we found that 1.35 Gm. of saccharin are required to every 1000 mils to approximately impart the same degree of sweetness to the glucose syrup as the sucrose syrup possesses. Similar experiments made with the Karo syrup showed that 1.20 Gm. of saccharin are required for every 1000 mils of 75 percent volume syrup. The formulae read, consequently, as follows:

WAR EMERGENCY FORMULA I.

| | |
|-------------------|----------|
| Glucose, liq..... | 667 mils |
| Water..... | 333 mils |
| Saccharin..... | 1.35 Gm. |

WAR EMERGENCY FORMULA II.

| | |
|--------------------------|----------|
| Karo, crystal white..... | 750 mils |
| Water..... | 250 mils |
| Saccharin..... | 1.20 Gm. |

The saccharin dissolves readily upon applying heat to the syrup.

Such a preparation would, no doubt, answer very well in a number of medicinal preparations in place of syrup. It might have to be modified to suit especial cases, but that could easily be accomplished. Let us, however, not forget to mention possible objections to the use of this syrup. Liquid glucose usually contains traces of sulphur dioxide, about 200-300 parts per million. A glucose syrup cannot be used with any substance easily susceptible to reduction, and finally a glucose syrup is not as permanent as a sucrose syrup. The tendency to fermentation may, however, be overcome by an addition of a small amount of chloroform.

On the other hand, a glucose syrup might be even more advantageously used in cases where a reducing substance tends to retard decomposition as in ferrous preparations or hypophosphites. I have prepared a number of galenicals, which I submit to your kind judgment. They are syrup of hydriodic acid, syrup of ferrous iodide, syrup of rhubarb and syrup of tolu, also compound licorice powder. In the latter preparation the sugar has been replaced by a mixture of saccharin 1.50 to pure white dextrose 1000 parts. English pharmacists recommend the use of a mixture of almond meal 8 parts, and acacia 1 part, or of starch, or of a corn-meal-saccharin mixture in this case. I find the dextrose-saccharin mixture to be the best. Another substance, which, of late, has come into somewhat extensive use in place of sucrose in ice cream is invert sugar. It is somewhat sweeter than sugar, and its usefulness in the preparation of galenicals might also be looked into. Honey and manna must be mentioned. Manna is said to be especially serviceable for use with, and in the preservation of, iron preparations.

II. GLYCERIN EMERGENCY SUBSTITUTES.

The manufacture of glycerin for medicinal purposes has been discontinued in England for quite some months past, and pharmacists must be content to use whatever stocks may still be on hand. When this is used up, no further supply will be obtainable. They are looking forward to the time when they will have to do without this substance, altogether with some apprehension, for it cannot be readily replaced. They feel that the disappearance of glycerin from pharmaceutical uses would be a calamity.

In suggesting substitutes for glycerin they follow lines laid down by various investigators in Germany, where the glycerin shortage has been acute almost from the beginning of the war. Prominent among them was Dr. E. P. Unna who claims that a good glycerin substitute must have the following properties:

- 1—It must have fatty properties, but must not be sticky.
- 2—It must be hygroscopic, must not decompose at high temperature nor solidify at low temperature.

3—It must be inodorous, non-poisonous, non-irritating and have an agreeable taste.

Substitutes for glycerin are very numerous, and for simplicity's sake they may be subdivided into five classes as follows:

a—Solutions of gums, glues or other viscous substances, such as agar-agar, fish glue, Iceland moss, linseed, marshmallow root, salep, tragacanth. The principle objection to these preparations is that they require the addition of a preservative, borax, formaldehyde, etc. In this connection, I might mention that acetanilid is claimed to have been found a good preservative for mucilages. A number of preparations of such type are on the market in Germany, for example:

Lempellin, a mucilage of Irish moss preserved with borax and formaldehyde.

Algin, an infusion of laminaria stalks with sodium carbonate.

Novoglycerin, a solution of glue in water.

Glycerit, a quince seed mucilage, containing 10 percent of glycerin and a small amount of borax.

b—Solutions of sugar.—About 60 percent of sugar is required to obtain a liquid of about the same fluidity as glycerin.

c—Mixtures containing fats or oils.—Since glycerin has the advantage of freedom from greasiness, oils and fats should be present in a substitute in a diluted form, preferably emulsified. A German preparation, Proglycerin, is a diluted lanolin emulsion. Paraffin emulsions may also be used.

d—Solutions of certain salts.—These solutions are used whenever the hygroscopic property of glycerin is the one desired in the substitute. A solution of calcium chloride, 36 percent, is used for medicinal purposes. Perglycerin is a 45 percent solution of sodium lactate; Perkalglycerin a 60–80 percent solution of potassium lactate.

e—Various mixtures not classifiable under any one of the above.—A solution of magnesium chloride, 21 percent, with 60 percent glucose is claimed to be well adapted for technical purposes. A mixture of equal volumes of 2 percent gelatin solution and glycerin gave a good preparation.

We see that the range of glycerin substitutes is a very wide one indeed, but the following general considerations may help to simplify the problem before us:

1—In preparations where physiological activity depends entirely upon the presence of the glycerin, substitution should not be attempted at all. Examples of such preparations are: Glycerite of boroglycerin, glycerin suppositories, and compounds of glycerophosphates. Physicians might be requested to refrain from prescribing them.

2—In the case of preparations whose glycerin content is either small or non-essential, the glycerin might be omitted entirely or its amount might be reduced to a minimum. Examples of such preparations are: Ointment of iodine, compound tincture of gentian, mucilage of tragacanth, and others.

Glycerin is used extensively in hair tonics, face lotions and creams. To save this amount, the druggist might be advised to make a good lotion or cream of his own and to recommend it whenever glycerin is wanted for the purpose. I take the liberty of quoting you several formulae recommended by the *Chemist and Druggist*.

- | | | | |
|-------------------------------------------|-----------|-----------------------------------------------------------|-----------|
| 1—Benzoinated Lard..... | 15 grains | Water..... | 2 ounces |
| Powdered Hard Soap..... | 20 grains | Mucilage of Carrageen..... | 1 ounce |
| Mucilage of Quince Seed.... | 1½ ounces | Essence of Lily-of-the-valley | 15 minims |
| Camphor Water..... | 1½ ounces | | |
| 2—An Almond Lotion: | | 4—A very fine cream is obtained by the following formula: | |
| Almonds blanched..... | 40 grains | White Wax..... | 1 drachm |
| Rose Water..... | 1½ ounces | Spermaceti..... | 1 drachm |
| Orange Flower Water..... | 1½ ounces | Wool Fat..... | 1½ drachm |
| Bruse the almonds and triturate then add: | | Zinc Oxide..... | 2 drachms |
| Borax..... | 12 grains | Spirit of Camphor..... | 1½ drachm |
| Tincture of Benzoin..... | 10 minims | Radium Water..... | 1½ drachm |
| 3—Soft Soap..... | 20 grains | Cucumber Juice..... | 1 ounce |
| Anhydrous Wool Fat..... | 15 grains | Sesame Oil..... | 2½ ounces |
| Almond Oil..... | 1½ drachm | Synthetic Oil of Rose..... | 10 minims |

I have prepared some of these creams, and have them here. They are very good indeed.

To replace glycerin in hair tonics, I find "turkey-red oil" recommended. This is sodium sulpho-ricinoleate. It is miscible with water. To replace glycerin in preparations where "body" is required, the London Pharmaceutical Committee recommends the following preparations:

| | | |
|---------------------|----|--------|
| Gum Tragacanth..... | 30 | grains |
| Chloroform..... | 24 | minims |
| Water, to make..... | 10 | ounces |

For internal use, the following is claimed to be more suitable:

| | | |
|-----------------------|----|---------|
| Gum Tragacanth..... | 2 | drachms |
| Alcohol..... | 4 | drachms |
| Chloroform Water..... | 10 | ounces |

Another formula suggested is the following:

| | | |
|-----------------------|----|--------|
| Picked Carragean..... | 1 | ounce |
| Water..... | 25 | ounces |

And finally, another one:

| | | |
|------------------------|-----|--------|
| Washed Irish Moss..... | 1/2 | ounce |
| Water..... | 24 | ounces |

Keep boiling for fifteen minutes, strain with pressure, make up to 19 ounces with boiling water and add 1 ounce of glucose. Mix and strain.

I have prepared some of these mucilages and, they are here for your inspection. Some of those used in Germany are also included.

The subject of war emergency formulae is certainly a very important one at this time. It seems to me to be even worthy of official consideration by the American Pharmaceutical Association. War emergency formulas might be worked out by a properly constituted committee, certain definite propositions made and duly legalized. Congress would surely not stand in the way, nor would State officers refuse to coöperate. By judicious effort of this nature, the American Pharmaceutical Association would make itself of great assistance to both the government and the profession. To the government such assistance would, no doubt, be most welcome, and it would be the carrying out, in a measure, of the promise of support made to President Wilson at the outbreak of the war. To the pharmacist, advice as to what he should do and can do in this emergency would be most valuable. When common substances become scarce, the pharmacist will do the best he can (which in many instances is the worst) and, furthermore, the temptation to illegal substitution becomes great.

Let us not wait until we are asked to do it, but let us be prepared. In our national emergency don't let us be followers, let us be leaders for the country's good.

THE PREPARATION OF DICHLORAMIN T. AND CHLORINATED EUCALYPTOL 1,2.*

BY ROBERT B. KRAUSS.¹

Para-toluol-sulphonidichloramide was first prepared by Kastle, Keiser and Bradey² in 1896, who also prepared a number of related compounds. Since its introduction under the name of dichloramin T. by Dakin, Lee, Sweet, Hendricks and LeConte,³ the production of this substance on a large scale in pure form, as

EDITOR'S NOTE. See also comment on this paper under Local Branches, this issue.

*Read before Philadelphia Branch A. Ph. A., December meeting, 1917.

¹ Henry Phipps Institute of the University of Pennsylvania.

² *American Chemical Journal*, 18, 491, 1896.

³ *Journal American Medical Association*, 69, 27, 1917.

well as that of suitable solvents for its application, have become problems of importance.

As originally used for this purpose dichloramin T. was dissolved in a prepared eucalyptol (chlorinated) and used in this condition or further diluted with prepared paraffin oil (chlorinated).

It was early recognized by the author that the products obtained by chlorination may vary considerably, according to the conditions of chlorination. By continued chlorination, under certain conditions, a chlorinated eucalyptol, specific gravity 1.2, is obtained, which has been extensively studied by surgeons. As a solvent for dichloramin T. it seems to have all the desirable qualities with the exception of the solution being definitely stable. There seems to be some reason to believe that chlorinated eucalyptol 1.2 itself has some therapeutic value.

This evening I will present an outline of the methods for preparing para-toluol-sulphondichloramide, and chlorinated eucalyptol 1.2, and the specifications for both as prepared for federal medical authorities.

1. PREPARATION OF THE SULPHONIC ACIDS.

Beginning with toluol, the sulphonic acids are formed by mixing equal parts of concentrated sulphuric acid and toluol. On shaking or even on standing the toluol dissolves in the acid. When the top layer of toluol has disappeared the sulphonation mixture is poured into water and neutralized with lime. After filtering, the solution of the ortho and para calcium sulphonates is treated with sodium carbonate and boiled to form the sodium salts and precipitate calcium carbonate. The filtered solution is evaporated to dryness and carefully dried.

2. PREPARATION OF THE SULPHOCHLORIDES.

The powdered sodium sulphonates are treated with an equal weight of phosphorus pentachloride. After the pentachloride has disappeared the semifluid mass is heated on the water bath to complete the reaction and then poured on ice. The para-sulphochloride crystallizes after a time while the ortho derivative is a liquid. They are separated by centrifuging.

3. PREPARATION OF THE SULPHONAMIDE.

The para-sulphochloride is melted on the water bath and treated with an excess of ammonium carbonate. The odor of sulphochloride should no longer be observable. The mixture of ammonium carbonate and sulphonamide is extracted with water and dried. If the sulphonamide is not pure white it should be recrystallized from hot water.

4. PREPARATION OF THE DICHLORAMIDE.

The toluol-para-sulphonamide is dissolved in ten parts of 1 : 10 caustic soda (39° Bé.) and diluted with twenty parts of water. The solution is filtered through glass wool and then through double filter paper. This removes iron hydroxide from the strongly caustic solution.

Chlorine gas from a cylinder is then passed through the solution, cooled externally by ice, until a voluminous white precipitate of para-toluol-sulphondichloramide is formed. This is filtered off, thoroughly washed twice with 5 to 8 parts of water and finally with enough 10 percent alcohol to make a thin paste. The dilute alcohol washing should be done very quickly and the substance filtered off with the aid of a vacuum filter. It is then dried at a temperature not exceeding 55° C. in a vacuum dryer.

The method has the advantage that it is very rapid and avoids the use of chloroform as a solvent. It was developed in order to produce a dichloramin T. which would be comparatively stable. The product has a negligible ash and a good chlorine content, but no free chlorine on standing.

Calculated: Cl = 21.54 percent. Found: Cl = 21.42 percent; 21.37 percent.

The very considerable work done in the chemical laboratory of the Institute on the preparation and distribution of dichloramin T. for surgical purposes has suggested the following specifications as most suitable for this material when used as a disinfectant:

PHYSICAL PROPERTIES.

White powder or crystals with slight yellow-green tinge. Melting point, $78-84^{\circ}\text{C}$.

CHEMICAL PROPERTIES.

Soluble in cold chloroform with slight to no turbidity. (Any turbidity must be removable by shaking with anhydrous calcium chloride.) Soluble in prepared eucalyptol, Dakin and chlorinated eucalyptol 1.2. Ash, not over 0.2 percent; chlorine content, 29.0 percent to 29.54 percent; calculated chlorine, 29.54 percent.

The solubility in chloroform or similar organic solvent is important in that it shows the presence of inorganic impurities, calcium salts, etc. The material should not have strong odor of chlorine, showing instability. The melting point may vary within the limits indicated, owing to moisture. Sharp drying will decompose the substance.

SOLVENTS.

The eucalyptol, as first proposed⁴ by Dakin and Dunham, was chlorinated with potassium chlorate and hydrochloric acid according to the following method:

Five hundred Cc. eucalyptol (U. S. P.) are treated with 15 Gm. potassium chlorate and 50 Cc. concentrated hydrochloric acid. After twelve hours the oil is well washed with water and sodium carbonate solution. Dry sodium carbonate is added to the oil and the mixture is allowed to stand twenty-four hours. It is then filtered and dried with a little calcium chloride.

This method has the disadvantage that no definite amount of chlorine enters the eucalyptol. The chlorination depends on the rate of adding chlorate and hydrochloric acid as well as the light in which the process takes place. Samples may have 1 percent chlorine present or scarcely any, depending on whether chlorination took place in sunlight or on a dark day. The specific gravity of this oil may vary from 0.930 to 0.935.

PREPARATION OF CHLORINATED EUCALYPTOL 1.2.

It was found that by passing chlorine gas from a cylinder into eucalyptol the reaction proceeded much further than by the chlorate method heretofore described. When a specific gravity of 1.20 was reached a comparatively heavy oil, much less volatile than eucalyptol, was obtained.

The results of the use of this oil are well known to-day; briefly, it was found that it is a good solvent for dichloramin T., that it can be used in full strength on the skin and in open wounds and that the use of paraffin oil either as a diluent or as a means of preventing sticking of dressings is unnecessary.

The following is a sufficiently detailed statement of the method by which this oil is obtained:

Through a glass tube reaching to the bottom of a five-gallon bottle containing about 10 kilos of eucalyptol is passed chlorine from a cylinder. The oil should have a boiling point of $176-177^{\circ}\text{C}$. and a specific gravity of 0.925 to start. The process should be carried on in good daylight.

During the chlorination the temperature rises and should be kept below 80°C . by regulating the chlorine stream. Hydrochloric acid is given off and may be absorbed in alkali.

When a specific gravity of 1.19 is reached the oil is chlorinated sufficiently and the process is interrupted. The oil is then washed with about four liters of water, then shaken thoroughly with 250 Gm. dry sodium carbonate and allowed to settle. After carefully decanting from the carbonate, about 500 Gm. fused calcium chloride are added and the whole again shaken. On standing preferably over night, the oil is filtered, bottled and is then ready for use. It is a white or slightly amber-colored oil, specific gravity 1.2, with a chlorine content of about 31 percent. Such an oil will readily dissolve 20 percent of dichloramin T. which solution may keep in an amber bottle without decomposition for a month.

FURTHER PRODUCTS OF CHLORINATION.

By further chlorination of the 1.2 oil, products may be obtained having a specific gravity of 1.5 and higher. This may be carried out by chlorinating directly at 100°C . or with a solvent such as chloroform at its boiling point. The oil of specific gravity 1.4 is amber colored and of the

⁴ Dakin and Dunham, *British Medical Journal*, June 1917.

consistency of molasses. The dichloramin is still soluble, although to a less extent. The future may find a use for this type of oil, since the increased viscosity presents an advantage in certain cases.

Dichloramin T. prepared as heretofore described is freely soluble in chlorinated eucalyptol 1:2. The solutions should be prepared about as follows:

PREPARATION OF 7 $\frac{1}{2}$ PERCENT SOLUTION.

Measure off 150 Cc. of oil into a dry brown bottle, preferably one with a glass stopper. Add to this 11.5 Gm. powdered dichloramin T. This will dissolve, if shaken occasionally, in about an hour. It should *not* be warmed. This makes a 7 $\frac{1}{2}$ percent solution, and is used for all dressings subsequent to the first two or three applications. This solution should keep for at least two weeks. If this is used in an atomizer, as directed, it has been found that one filling of the usual atomizer reservoir will dress from 100 to 150 cases.

PREPARATION OF 20 PERCENT SOLUTION.

This solution should be made up about 25 Cc. at a time, using 5 Gm. of dichloramin T. to 25 Cc. of oil. It is most quickly accomplished by trituration and the solution should be kept in a brown bottle. This is applied to fresh wounds and for the first treatment of infected wounds and focal infections. It is most conveniently applied with an ordinary medicine dropper. This solution is good until a crop of fine crystals appears in it, which may happen in three days, although it may remain in good condition for ten or more days.

When using the solution in an atomizer, the reservoir of which is of colorless glass, the solution should be protected against light as light greatly accelerates the decomposition of dichloramin T. in solution. The following points should receive consideration in its clinical use:

1. Surgical asepsis, as perfect as possible, should be used at both the primary operation and subsequent dressings.
2. At the primary operation all wound surfaces should be covered and all crevices filled with the 20 percent solution. Subsequent dressings are made with the 7 $\frac{1}{2}$ percent solution.
3. Before the oil is applied the surfaces of the wound should be as dry as possible; free from blood and water.
4. Drainage should be avoided in all wounds closed by suture.
5. It has been suggested that with local infections, such as boils, carbuncles and abscesses, an incision be made somewhat earlier than usual and the 20 percent solution of dichloramin T. freely applied will very often sharply limit the progress of the infection.
6. This preparation is essentially non-irritating unless confined by unduly heavy or impervious dressings. If so confined, it may blister.

In conclusion I wish to acknowledge the coöperation of Doctors P. A. Lewis and W. E. Lee, and also the assistance of Miss Elizabeth Hill, in the chemical manipulations.

MAJOR D. A. COSSAR.

According to latest advice, Major D. A. Cossar, who was expected in this country, has been in Egypt; from there he will go to France. Mention was made in the JOURNAL, p. 922, October issue.

COMMERCIAL SECTION

THE PRECEPTOR—AN ASSET OR A LIABILITY?*

BY FRANKLIN M. APPLE.

From the definition of the word "preceptor" given by standard authorities, theoretically, there should be but one answer to this query: an affirmative one as an asset; but from customs in vogue in some establishments, branded drug stores, and from experiences had with employees from such shops, one is compelled, with reluctance, to decide that some preceptors are liabilities to those who have the misfortune to be in their employ.

The preceptor in the drug business should realize that he assumes a moral responsibility to his employees, who place a measure of faith in his integrity and business judgment when he takes them into his employ; hence he should exercise great caution that the embryo pharmacist, at the most impressionable time in his life, be directed along proper lines of action, which action upon the clerk's part will depend in large measure upon the customs that prevail in the establishment over which the proprietor has supreme command, as the rules of the store will automatically be indelibly impressed upon the mind of the faithful employee.

The advantages (or disadvantages) of the direction of the preceptor will be in direct proportion to the faithfulness of the employee, and we all know that the faithful employee is the only sort the good pharmacist is solicitous of employing.

When serving my apprenticeship, I was skeptical concerning rumors to the effect that in some few establishments very low wages were received by the tyro-pharmacists there employed; but after a quarter century's active service in the role of a pharmacist, and observing the varying value of various employees, I have no doubt as to the aforesaid rumors, and the great advantages enjoyed by those who had the good fortune to be under the direction and supervision of truly representative, responsible employers, who were mindful of the obligations to their employees. The advantages of such a line of action are not unfair or unbalanced ones, as far as the preceptor is concerned, for the the proverbial shortage of *good* help is one that does not annoy such a one; because there will be competition to enter his employ upon the part of intelligent employees, and other employers make appeals to him for positions for their wards when attending college, if located in a city where a college of pharmacy is operated.

As it will be necessary for the employee to carry out the processes of manufacture in a drug store that is properly conducted, it is self-evident that he will become familiar with such processes and facilities for manufacturing, which knowledge and practice will prove to be of lasting benefit to him as a clerk or as an employer.

It is said that the clerk of to-day is the proprietor of tomorrow, hence it can readily be seen that he stands to gain very materially by having been in the employ of a first-class pharmacist.

* Read before Section on Commercial Interests, A. Ph. A., Indianapolis meeting, 1917.

Reversely, it is advantageous to the employer to properly train his employees, for, if they become proprietors, they will assist in keeping up the standards of the business as a matter of custom or second nature, and he surely will feel the advantages that such customs will produce.

If the clerks have had desirable practices to follow when employed, they are not likely to want to follow less desirable ones when directing their places of business. They will be more prone to yearn for, and determine upon more pleasing and more comfortable conditions, which will lead to a far better state of affairs for all followers of the calling.

As a nation, we have been notorious as squanderers of our resources, showing but little regard for the affairs of to-morrow, but, with the advent of the unprecedented conditions that prevail to-day, it is very important that we take time to take account of stock, as it were, and plan with far more deliberation for the future than we have done in the past.

These are stirring and heart-rending times and each and every one should as a patriotic duty seriously consider how he can contribute to the welfare of the nation.

If careless financial methods have been followed, they should be discontinued immediately in self-defense to proprietor and clerk, for then the proprietor may be able to pay the clerk a better salary.

If slovenly practices have been followed, to the great detriment of the budding pharmacist, the proprietor should "wake up" or competition will eliminate him as an employer in the near future, for business is making very rapid strides along the lines of cleanliness and order.

If questionable business morals are the basis on which a drug store is conducted, the sooner a clerk severs his connection with the place the better it will be for him, as he cannot afford to run the risk of the evil effects of such environment.

If an employer does not prove to be what he morally obligates himself to be to the clerk—a preceptor or teacher—when he requests him to enter his employ, the drug clerk is being treated dishonestly and unfairly and should keep on the lookout for an employer who will faithfully carry out his part of the bargain made when hiring the novice.

As the majority of employers are close observers of the habits of their employees and realize their obligations to their worthy employees, it is incumbent upon the latter to prove their worthiness of confidence, and to instill into the minds of their masters the fact that it will not be a waste of time and effort upon the part of the preceptor to allot a certain portion of each day's time, if possible, to the improvement of their pupils, realizing that they will receive the benefit from such action by the improved service the employees can and will render to them.

I shall never forget the systematic course of study I was compelled to follow by my first employer in the drug business, and I feel certain that the habits then formed have been a lasting benefit to me; and I certainly recommend that all employers, if possible, demand that a certain course of reading and study be followed by their employees—particularly so by those just entering the drug business.

The ex-employees of some of our first-class drug stores are known as one of —'s boys, to which they allude with pride (and in many instances with great

profit), as they now appreciate the great opportunity it was to them to have been in the employ of such an employer.

As the brand trade-mark on some lines of manufacture inspires confidence in the goods bearing said marks, so the record of having served a satisfactory apprenticeship with proprietors of certain standing gives their ex-employees credentials that are of great benefit and value; hence the selection of a preceptor is a very momentous question for the young man entering pharmacy, and no hasty decision should be made upon this question, for the years of employment, while acquiring the degree of pharmacist, are but a small portion of the years the average clerk is connected with pharmacy.

Preceptors in pharmacy should realize the moral obligations they assume when employing clerks and should govern themselves accordingly. A full realization of those obligations will soon bring about a decided improvement in the quality of clerks; also establish the drug business upon a higher plane, with better financial rewards.

The opportunity is at hand. Will it be embraced?

Time only can give the answer; but may our generation not be compelled to be ashamed of its record, and deliberately throw away the golden opportunities that are at hand, for America has a new era awaiting for all alert, honorable, intelligent workers.

WOMEN IN PHARMACY TO-DAY.

BY R. A. KUEVER.

During the past three years European countries have witnessed the advent of women in fields hitherto controlled entirely by men. Inspired by patriotism, women offered their services in offices and factories where their help, at first a grateful addition, soon became a real necessity. With the duration of the war came multiplication of their tasks, until women's sphere included the most menial labor in mines and ammunition plants. They have borne their added responsibilities bravely and capably, sacrificing equally with the men folk in order to do their bit.

America will witness the same spectacle in the months to come—is witnessing it now in a small way. With us, however, it is different in that our women are afforded time to fit themselves for the work. The delay in placing our fighting forces in the field has enabled the majority of our men to continue their business undisturbed, or to substitute other men in their places. Women have shown an ardent desire to serve, and in many places girls are being employed to run elevators, page lobbies and perform similar tasks. But by far the greater number are serving by conserving and knitting—nor would I undervalue that service—but it must be materially increased and broadened as our man power decreases.

How can I best serve is the question confronting thousands of wide-awake American women, who are looking into the future welfare of our country. There is no field which offers greater opportunities than pharmacy. The demand for skilled pharmacists has never been as great, the salaries have never been so large,

and the number of available pharmacists never has been so small as it is at present—three very good reasons why more women should enter that field. Not only that, it is work for which women are admirably fitted. It does not require hard manual labor; it is clean, pleasant work, which any scientifically trained woman can do admirably and enjoy doing. Calls for registered pharmacists are constantly being received which cannot be filled because so many of the young men in that profession have entered some branch of our national service, and many more will be called to the colors this winter.

Our professional colleges feel the loss of the young men who have responded so promptly to their country's call, but their places are bound to be filled by women who realize in this their opportunity for service. The percentage of women in professional training is decidedly on the increase. At the State University of Iowa this year, seventeen percent of those registered in the College of Pharmacy are women. Another year it will be even greater, for women are quick to avail themselves of the double opportunity to earn their livelihood and at the same time do their bit.

WARNING AS TO CRUDE DRUGS.

Because of the discovery of as much as 25 percent of dog fennel in recent shipments of chamomile and of foreign materials in other crude drugs, the United States Department of Agriculture warns dealers and shippers to purchase only on explicit specifications. When imported, or shipped in interstate commerce, or when offered for sale in the Territories or the District of Columbia, crude drugs are adulterated within the meaning of the Food and Drugs Act if their strength or purity falls below the professed standard or quality under which they are sold. If the drug is sold under or by a name recognized in the United States Pharmacopoeia or National Formulary, it must conform with the requirements thereof as to strength, quality, and purity. If it differs therefrom, and the name recognized in the Pharmacopoeia or Formulary is retained, then the bottle, box, or other container must bear a plain statement of its own standard of strength, quality, or purity.

A WORD FROM THE TREASURER.

The A. Ph. A. fiscal year runs even with the calendar year. The annual payment for 1918 was due January 1. The bills were mailed to the members December 17, 1917. It is gratifying to state that at the present writing, January 5, the treasurer has received 725 payments for 1918. A prompt response from the other members will save the association the expense of mailing a second bill.

New Year's greetings to all from

HENRY L. WHELPLEY,

2342 Albion Place, St. Louis, Mo.

SECTION ON EDUCATION AND LEGISLATION

MINUTES OF THE SECOND SESSION OF THE SECTION ON EDUCATION AND LEGISLATION, A. PH. A., INDIANAPOLIS MEETING.

The second session of the Section on Education and Legislation was called to order at 9.30 A.M., Friday, August 31.

The first order of business was the reading of the report of the Committee on Regulations for the Transportation of Drugs by Mail. It was ordered that the report take the usual course. The report follows:

REPORT OF THE SPECIAL COMMITTEE ON REGULATIONS FOR TRANSPORTATION OF DRUGS BY MAIL.

At the time of this Committee's last previous report the Kern-Doremus bill was under consideration by Congress. It promised to be the most important step yet recorded in the movement to provide for the transmission of poisons through the mails. Toward the close of the same year, 1916, the Postmaster-General, with a somewhat similar object in mind, submitted some recommendations which were made part of the customary Postoffice Appropriation bill. But the two plans of relieving the situation were found to be quite different, and, in fact to differ so radically that a sharp controversy arose between the drug trade and the Postoffice Department over which form should be enacted.

The Kern-Doremus measure provided for the carrying through the mails of drugs of all kinds whether poisonous or not, with proper safeguards as to packing, etc., written into the law. Such legislation would be important and would give relief not alone to the drug trade but to all interested in the arts and sciences. This movement had the almost unanimous endorsement of the drug trade, one of the most important organizations backing it being the National Drug Trade Conference. The Postmaster-General in his recommendations sought to amend Section 217 of the Penal Code, which relates to the prohibition of all kinds of poisons, explosives, inflammable matter, etc., from transmission through the mails, so that he would have power without restriction to make regulations governing the carrying of drug poisons in the mails.

He would have the law permit the shipment of poisons, etc., between responsible parties, as between manufacturer and jobber, jobber and retailer, and the like. The Drug Trade Section of the New York Board of Trade and Transportation was also reported to be supporting this measure.

Neither bill has been passed. In the case of the Kern-Doremus bill, Congress adjourned by limitation March 4th before it was reached, and the present session is of course only concerned with war measures. As for the Postmaster-General's amendment to Section 217, it was thrown out of the Postoffice Appropriation bill on a point of order to the effect that it was new legislation on a general appropriation bill. There seems, therefore, to be no hope of change in the existing conditions before the next regular Congress.

Respectfully submitted,

B. L. MURRAY, *Chairman.*

The following papers were read, discussed and referred for publication:

"Some Ideas about the Teaching of Practical Pharmacy," by Zada M. Cooper. (See p. 1065, December 1917.)

"The U. S. P. IX and N. F. IV as Text Books for Pharmacognosy," by W. F. Gidley. (See p. 809, September issue.)

"Iowa's Prerequisite Law," by J. M. Lindly. (See p. 928, October issue.)

"What Compulsory Health Insurance Would Mean to the Druggist," by Harry B. Mason. (See p. 881, October issue.)

It was ordered that reprints be made of Mr. Mason's paper and sent to the legislative committee of each state association.¹

On motion of J. H. Beal and second of Wm. C. Anderson, the resolutions presented by Mr. Mason were also approved by vote of the Section. (See p. 890, October issue.)

¹ Reprints have been sent out as instructed.—*Editor.*

F. W. NITARDY: Prohibition confronts us in many states at this time. The Colorado Prohibition Law did not specifically include alcohol, but did by the inclusion of spirituous liquors or preparations that might be used as intoxicants.

We endeavored to have passed an alcohol bill, defining the status of alcohol and legalizing its use for strictly legitimate purposes, but were unsuccessful. Through the influence of the Denver Branch of the A. Ph. A., we succeeded in having the druggists of Colorado restrict the sale of alcohol to a form of bathing alcohol denatured to an extent that it could not be used internally; namely, by making a mixture of alcohol and water and tartar emetic and selling this as bathing alcohol.

We went about the work very carefully and tried the mixture out, and then asked for a joint meeting with the Denver County Medical Association, when we submitted the formula to them, and put up our arguments why we would like to have their approval of this particular formula for an alcohol for external use. After three joint meetings we succeeded in getting the unanimous approval of this association, and then we published the formula very widely. We wrote to all the state officials and the people that were behind the prohibition forces, giving it very wide publicity, and getting all the druggists behind it, and the result was that there was not any beverage alcohol sold in the State of Colorado after the dry law went into effect. The only alcohol sold was the so-called bathing alcohol.

Two years later we went before the legislature, and we had then placed ourselves sufficiently in the confidence of the prohibition forces so that we were able to pass our Alcohol Law. Experience had taught us a lesson or two that made our final alcohol law just a bit different from our original idea of it.

I have with me here the Alcohol Law of the State of Colorado which I want to offer to this Section for other states to follow, if they happen to have prohibition legislation that endangers the legal status of alcohol. We all know how important alcohol is to the drug business, and that we cannot afford to have its use and importation into the state so restricted that it can be only prescribed in four ounce quantities by a physician.

The particular part I want to offer to this Section is the two formulas that we use in our State Law. Section 4 of our law reads as follows:

SECTION 4 OF COLORADO ALCOHOL LAW.

It shall be lawful for licensed wholesale or retail druggists to purchase and sell alcohol denatured under either one of the two following formulae:

| | |
|-----------------------------------------|---------------------------------------|
| (1) Tartar Emetic, U. S. P | 1.00 Gm. (58 grains) |
| Solution of Formaldehyde, U. S. P | 2.60 mls ($1\frac{1}{2}$ fluidounce) |
| Distilled Water..... | 475.00 mls (48 fluidounces) |
| Alcohol..... | 650.00 mls (83 fluidounces) |

To make about..... 1,000.00 mls (1 gallon)

Dissolve the tartar emetic in the water, add the formaldehyde solution, then the alcohol and mix well. And to comply with the following test:

If 100 mls of bathing alcohol prepared in accordance with this formula be evaporated to dryness on a water bath and then heated in an air bath at 100° C. for fifteen minutes, or until all of the formaldehyde is dissipated, the residue obtained should respond to the test of identification given under Antimony and Potassium Tartrate in the U. S. P., and should require not less than 5 mls of tenth-normal Iodine V. S., when assayed according to the U. S. P. process, corresponding to not less than .083 Gm. of tartar emetic per 100 mls of bathing alcohol.

| | |
|-----------------------------------------|--------------------------------------|
| (2) Croton Oil, U. S. P..... | 1 mil (62 minims) |
| Ether..... | 19 mls ($2\frac{1}{2}$ fluidounces) |
| Solution of Formaldehyde, U. S. P | 4 mls ($1\frac{1}{2}$ fluidounce) |
| Alcohol, U. S. P | 976 mls (125 fluidounces) |

To make about 1,000 mls (1 gallon)

Dissolve the croton oil in the ether, then add the alcohol and formaldehyde and mix well. And to comply with the following test:

If 100 mls of bathing alcohol prepared in accordance with this formula be evaporated on a water bath until the alcohol and ether have been dissipated, the residue dissolved in about 10 mls of ether, filtered, the filtrate evaporated on a water bath until the odor of ether is no longer perceptible, the oily residue, after heating in an air bath at 100° C. for fifteen minutes, should weigh not less than .085 Gm. nor more than .100 Gm. and correspond to the tests of croton oil as given by the U. S. P.

Provided, that such denatured alcohol shall bear the following form of label when sold or offered for sale:—

BATHING ALCOHOL.

Formula No.—

FOR EXTERNAL USE ONLY.

POISONOUS IF TAKEN INTERNALLY.

Then our law permits the sale of the regular so-called denatured alcohol. I want to explain that in constructing these formulas we found by experience that the amount of water mentioned in formula No. 1 is necessary to hold in solution the amount of tartar emetic we have in the formula. We found that unless we could put that much tartar emetic in the preparation it was not of much use. We found people could drink it if less amount was present.

This formula for bathing alcohol has been used by every druggist in Colorado for two years or more, and we have had only one complaint that it was unfit, irritating or objectionable in any way for external use. The Federal Government has published about thirteen different formulas that can be used to denature alcohol. This alcohol may be sold without a U. S. Revenue license. The one complainant wanted one of the other formulas used. The druggist poured in a little oil into the same bathing alcohol, thinking that the objection was more imaginary than a real one, and this customer came back later on and commented on how much better this particular bottle of alcohol was, stating that none of the irritating effects she had noticed in the other was present.

One reason for being anxious to bring this before the Association is that in the August JOURNAL OF THE A. PH. A., p. 700, Dr. Otto Raubenheimer wrote an article mentioning this to some extent and stating that we were very much mistaken in the idea that we could sell an alcohol of this kind without a liquor license. It started up a little commotion two days before I left Denver. I took the trouble to go to the Revenue Office in Denver and made careful inquiries in regard to that, and I find that the statements in this article of the JOURNAL differ with their views. An alcohol of this kind can be sold by any one without the Federal liquor license, and some action should be taken at this meeting to correct the wrong impression that has been sent out through the article mentioned.

I want to further explain the presence of formaldehyde in both of these formulas. That is done so that this will comply with the federal regulation which exempts us from the tax. The U. S. Government permits thirteen different mixtures of alcohol and other things to be sold as a denatured form of alcohol without license, and one of those is a mixture of one part of formaldehyde and two hundred and fifty parts of alcohol, known as Formula No. 3; that mixture is considered sufficiently denatured so as to make it unfit for internal use. You probably will realize that one part of formaldehyde in two hundred and fifty parts of alcohol would not keep some persons from drinking it, and we found that to be true in Colorado.

THE CHAIRMAN: I believe that Mr. Nitardy's very able presentation of this topic will more than correct Mr. Raubenheimer's paper, so that I do not believe any action on the part of this body is necessary. Is there any discussion?

DISCUSSION.

C. M. WOODRUFF: Before the members of this Association act upon the expressed opinion of the Collector of Internal Revenue in Denver, or anywhere else, it should be confirmed by the Commissioner of Internal Revenue.

Now, I may be incorrect, but my opinion is that the Commissioner of Internal Revenue at Washington has very recently pointed out that it is unlawful for druggists, who have not paid a special tax applying to the sale of alcohol, to sell these special denatured alcohols that have been recently authorized. I am under that impression, though not certain. You get all kinds of opinions from collectors. I obtained one kind through our New York office from a New York collector and another kind from our Detroit office from a Detroit collector, and when I was not satisfied I got an opinion from the Commissioner of Internal Revenue at Washington.

Another suggestion, has any effort ever been made to have these formulas authorized by the Commissioner of Internal Revenue so as to save the expense of using tax-paying alcohol in making these bathing solutions? Now, in considering that you must bear in mind that in these recent special denaturing formulas the Commissioner has limited the privilege of producing these to several distilling plants having denaturing licenses, I think we had better go slow before we conclude that the tax is not required.

F. W. NITARDY: Mr. Chairman, may I answer Mr. Woodruff's question? I have with me Treasury Decision No. 1843, and Mr. Woodruff's first question will be answered by reading one sentence from this decision. Reading:

"If, however, the alcohol before sale is rendered by the apothecary unfit for beverage uses in accordance with any formula approved for the destruction of the identity of alcohol in scientific institutions and hospital departments (see Treasury Decision 1757) no tax liability will be incurred."

We have been selling in the State of Colorado without federal license for three years, this particular mixture, and have had no trouble with the Internal Revenue Department. The article in the JOURNAL started up a discussion in Denver and I went to the trouble to find out if there was anything later than this Treasury Department Decision on the subject, and was informed by the Internal Revenue Department that there was no later decision, and there had not been any other rulings on the subject.

The other question asked by Mr. Woodruff, whether tax-free alcohol could not be obtained for this purpose, is also something we took up in Colorado. I wrote to the Secretary of the Treasury in an effort to have something done along that line, but we were turned down.

W. C. ANDERSON: A question is raised here on which there is an entire difference of opinion. In fact, if this goes out before the druggists of this country there will be hundreds of them fined for violation of the law. In my opinion, Mr. Nitardy is wrong and Mr. Raubenheimer is right. This is of vital importance and I think we ought to have it settled.

I would like to ask Mr. Nitardy if he submitted any questions with reference to this tax and these formulas to the Internal Revenue Department at Washington.

F. W. NITARDY: We did. We submitted not only our formula, but our state law, to the Internal Revenue Department with the request that we be permitted to have tax-free alcohol used in preparing this, stating that it was being sold without a liquor license as evidence that it was not a liquor. We received some lengthy correspondence on the subject, showing the reason why it could be sold without a license, but that tax-free alcohol could not be used in the manufacture of it without amending the revenue laws of the country.

W. C. ANDERSON: The situation is really this: that a druggist cannot denature alcohol and sell it for bathing purposes by either the formula you have given or any of the formulas printed in that circular, according to the Commissioner's own assertion. This matter was taken up in the King's County Pharmaceutical Association some years ago and I sent that very decision you have there to the Commissioner asking him if retail druggists could denature their alcohol in conformity with that law and sell it without tax, and his answer was positively no, and that those formulas were intended for institutions such as hospitals, and so forth.

I find that inspectors of the Internal Revenue Department, even collectors, make vital mistakes. We had one of the collectors in New York State tell a druggist that unless he took out a license and paid the tax he could not keep alcohol on hand for making tinctures, which was not a fact; so your collector, while he may not prosecute anyone in Colorado for doing as you are doing, he is not substantiated by the statements made, and the regulations at Washington. I cannot give you the number, but there is a pamphlet that gives the regulations so far as denatured alcohol is concerned, and it states that denaturing of alcohol will not be allowed by the Government, and sale of that denatured alcohol by the person denaturing it is prohibited, except it be by a denaturing plant licensed by the Government and under its supervision. You cannot denature alcohol for making tincture of iodine and sell it, but we have manufacturing houses selling tincture of iodine to the druggists to-day. That becomes denatured alcohol, but that tincture of iodine has to be made in a denaturing plant licensed by the Government. If a doctor writes a prescription for the formula you have there the druggist can compound it without being subject to the tax. If a physician writes a prescription containing tartar emetic and those other ingredients, a druggist can compound it without being subject to the tax; but a druggist cannot put those ingredients in the alcohol himself and denature it and sell it over the counter without

being subject to the tax. That comes direct, as I say, from Washington, because we in New York State had considerable trouble over the same question and made a thorough investigation and got all the information from that particular source. I do not want the druggists of the country deceived on this proposition.

F. W. NITARDY: Mr. Chairman, I believe Dr. Anderson has several Treasury Decisions confused. There are two decisions that give this same set of thirteen formulas. One I have in my hand; the other I have not with me, because I thought it of no use for this argument. It designates the same thirteen formulas for the purpose of denaturing tax-free alcohol to be used by hospitals and scientific institutions. That is Treasury Decision No. 1757. That particular Treasury Decision uses tax-free alcohol, this is an entirely different proposition from the alcohol the druggist buys from his jobber.

All the claim that I am making is that the druggist can use tax-paid alcohol and denature it according to Government requirements and sell it without the retail liquor dealer's license. That explanation was given to me in the Internal Revenue Office and it is clear from the reading of this decision.

OREL JONES: I would like to back up Dr. Anderson. I have at home the written decision of the Commissioner saying these formulas can be used on prescriptions only and not by the retail druggists for general sale.

S. L. HILTON: The statement of the gentleman is correct. Further, I want to add that when you do sell that alcohol that is tax-paid and denatured by yourself, without the internal revenue retail liquor dealer's license, you assume also the burden in case that product is used for beverage purposes, you are then guilty and will be so handled by the federal authorities.

F. W. NITARDY: I would like to ask of these gentlemen who have different opinions on this subject, how the druggist is permitted to make tincture of iodine and sell it without a liquor license. It was stated that it was a denatured form of alcohol, so the druggist, according to your statements, has no right to make tincture of iodine and sell it.

W. C. ANDERSON: A druggist can make any tincture. He can manufacture anything in his place with alcohol without paying the tax, but he cannot make tincture of iodine and then claim, from the Government, a return of tax paid on that ethyl alcohol; a denaturing plant licensed by the Government to denature alcohol can make tincture of iodine from grain alcohol and iodine and get a return on the tax.

F. W. NITARDY: We do not ask for any return of revenue on the denatured alcohol we sell. I ask how it is that a druggist can sell tincture of iodine without a retail liquor dealer's license?

W. C. ANDERSON: Because he can sell any preparation.

F. W. NITARDY: In the form of a medical preparation, a liniment, and so forth? In what manner does that medicinal preparation, this formula I have read, differ from some other liniment containing alcohol that is intended for external use and is unfit for internal use?

W. C. ANDERSON: The difference is that the Government examines every preparation on the market to discover their alcoholic and their medicinal content. They examine U. S. P. and N. F. preparations. They are medicinal preparations, compounds, and so recognized. They do not base their decision on the amount of alcohol contained. It may contain three percent of alcohol or ninety-five percent, but they base their decision on the amount of medicinal ingredients in the preparation. If there is enough medicine to make it a medicinal compound and not liquor, they do not list it as liquor. It may only contain five percent of alcohol and be listed as a liquor and the person who sells it has to pay the tax.

F. W. NITARDY: According to that the burden of proof is with the Government. Until these formulas are listed as liquor they will go tax-free.

W. C. ANDERSON: The burden of proof is upon the person selling the preparation. Mr. Nitardy is taking an awful responsibility. I am asking if he will not consider this matter carefully and look into it fully before he allows his present conclusions to get out among the retail drug trade.¹

THE CHAIRMAN: We will now hear a report on the work of the Voluntary Conferences for the Drafting of Modern Laws Pertaining to Pharmacy, by Chairman F. H. Freericks. (To be printed.)

F. H. FREERICKS: Now, Mr. Chairman, if it is in order, I would move that the draft of these provisions be made a special order of business at the afternoon meeting.

THE CHAIRMAN: It is certainly in order.

F. H. FREERICKS: I would so move.

(Mr. Freerick's motion was duly seconded and carried.)

THE CHAIRMAN: Before we adjourn we have one more topic of business, that is, the nomination and election of officers. The Secretary will read the names of those who were nominated at the close of the Wednesday session.

¹ See p. 1007, November issue, also p. 1117, December issue.

THE SECRETARY: Chairman, C. B. Jordan; for Associates, R. A. Kuever, F. W. Nitardy and C. E. Mollet; for Secretary, W. F. Rudd.

W. J. TEETERS: I move that the nominations be closed and that these gentlemen be elected by acclamation.

(The motion was duly seconded and carried.)

THE CHAIRMAN: The meeting stands adjourned until two o'clock this afternoon.

JOINT SESSION OF THE SECTION ON EDUCATION AND LEGISLATION WITH THE AMERICAN CONFERENCE OF PHARMACEUTICAL FACULTIES AND THE NATIONAL ASSOCIATION OF BOARDS OF PHARMACY.

The Joint Session of the American Conference of Pharmaceutical Faculties and the National Association of Boards of Pharmacy and the Section on Education and Legislation of the American Pharmaceutical Association was called to order by President Rufus A. Lyman, of the American Conference of Pharmaceutical Faculties, Friday, August 31, at 2.00 P.M.

The first order of business was the report of the current meeting of the American Conference of Pharmaceutical Faculties, by Secretary W. J. Teeters, of Iowa. The report follows:

ABSTRACT OF THE MINUTES OF AMERICAN CONFERENCE OF PHARMACEUTICAL FACULTIES.

The eighteenth annual meeting of the American Conference of Pharmaceutical Faculties was held in Indianapolis, at the Hotel Claypool, August 27 and 28, 1917.

The presidential address of Professor R. A. Lyman was so inclusive in scope and recommendations that all committee recommendations were, by request, to be considered in connection with it. The committee on the President's address consists of W. C. Anderson, of New York, C. E. Caspari, of Missouri, and C. A. Dye, of Ohio.

The following recommendations were approved by the Conference, or such action taken as indicated in this report.

Recommendation No. 1.—That the Conference appoint Dr. Edward Kremers, of the University of Wisconsin, a committee of one, to prepare a brief account of the lives and services of J. O. Schlotterbeck, W. C. Alpers, C. Lewis Diehl, and any others who may have died during the year, and that these accounts be printed in, and be considered a part of the records of the proceedings of the 18th meeting of the Conference, and that the Secretary of the Conference be instructed to notify the respective families of the action which has been taken. Adopted.

Recommendation No. 2.—That the Conference instruct the Secretary to take the proper steps before the next annual meeting in order that Article 1, of the Constitution, may be changed to read, "This body shall be known as the American Association of Schools of Pharmacy," and that the constitution and by-laws be modified in conformity with this change. Rejected.

Recommendation No. 3.—That the recommendation of the Executive Committee, with reference to committees, as indicated on pages 211 and 212, of the Seventeenth Proceedings, be considered not final, and that the following constitute the permanent standing committees of the Conference:

- | | |
|--------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| No. 1. Committee on Higher Educational Standards. | No. 6. Committee on Relations of Pharmacy Schools and Other Professional Schools. |
| No. 2. Committee on Faculties (Classification and Teaching Staff). | No. 7. Committee on Relations of the Colleges with the Boards. |
| No. 3. Committee on Curriculum and Teaching Methods. | No. 8. Committee on Joint Examination Questions. |
| No. 4. Committee on Activities of Students and Alumni. | No. 9. Committee on Research |
| No. 5. Committee on Uniform College Bulletin. | |

Recommendation No. 4.—That a four-year high school requirement become binding upon schools of the Conference, September 1, 1920.

This was amended by striking out September 1920, and substituting September 1, 1923, and adopted as amended.

Recommendation No. 5.—That it be the sense of the Conference that Mr. Fairchild could render the greatest service to pharmacy by offering the scholarship to a graduate pharmacy student, in order that he might pursue some research problem for one full school year, in the school of his choice; and further, that this scholarship be awarded on the basis of the applicant's scholastic training, his standing as an undergraduate pharmaceutical student and upon his fitness to do research. Approved and referred to joint session.

Recommendation No. 6.—That the University of Santo Tomas de Manila be asked to designate someone in this country to act as her official representative at the Conference meetings, in order that we may feel the personal touch of that worthy institution, and that that institution in return may feel in a more direct way the inspiration which comes to an institution as a result of contact with the Conference.

Recommendation No. 7.—That the Secretary of the Conference be instructed to write a letter, in the kindest terms, but in a language which cannot be misunderstood, calling attention to what membership in the Conference means, pointing out where certain members have been negligent, and mail such letter to the Dean or Chief Executive Officer of each one of the departments, schools or colleges of pharmacy, and also to the President of each institution of which these pharmacy schools are a part.

Recommendation No. 8.—That the Executive Committee be instructed to invite some educator of prominence, who is in sympathy with pharmaceutical ideas, amenable, to meet with and address the Conference upon some problem relative to pharmaceutical education. This was referred to the Executive Committee, with instructions to secure some noted educator for an address each year when possible to do so.

Recommendation No. 9.—That the Executive Committee be instructed to study the matter of organization of colleges of pharmacy in the various Conference schools, and wherever it is thought desirable on the part of the school concerned, to offer any suggestions and help which the Conference has at its command.

Recommendation No. 10.—That the Executive Committee be instructed to investigate the organization of schools, to determine if there are cases where two schools are paying but one membership fee and the same men are representing two schools maintaining different requirements, and that the Executive Committee report at the next annual meeting.

Recommendation No. 11.—That the Executive Committee be instructed to notify a certain Conference school (the name of which the President will give in executive session) that the placing of traveling representatives upon the road is not in keeping with the spirit of the Conference, and that such action will not be tolerated and that an explanation of this college's action must be presented at the next annual meeting. The recommendation was referred to the Executive Committee, with instruction to formulate a rule covering this matter, for later submission to the Conference.

Recommendation No. 12.—That the Executive Committee be directed to present this matter to the Carnegie Foundation, and if this Foundation refuses to take it up, to discover some other method of investigating and classifying so as to accomplish a similar result and to report at the next annual meeting.

Recommendation No. 13.—That your Committee on Relations of Colleges with Boards be instructed to express the above view as the sentiment of the Conference, and that this Committee, in conjunction with the proper committee of the Boards, be requested to devise or discover a plan which can be developed, that will render justice to all, and that progress in the matter be reported as early as possible. This was disposed of by a motion that a committee of the Conference, in conjunction with the proper committee of the Boards be requested to devise a plan that will render justice to all concerned in the matter of apprenticeship.

Recommendation No. 14.—That the Committee on Activities of Students and Alumni be directed to devise a plan for establishing an honorary scholarship fraternity in pharmacy and report the same at the next annual meeting. Approved.

Recommendation No. 15.—That it be the sense of the Conference that for the study of pharmacy we should require one year of college work after September 1, 1925, and two years of college work after September 1, 1930, and that this declaration be given wide circulation through the pharmaceutical and lay press and that a special notice of such action be sent to the president of each American university holding membership in the Conference.

Action on this subject was postponed until next year.

The officers elected for the coming year were as follows: *President*, Henry Kraemer, Ann Arbor; *Vice-President*, Charles E. Caspari, St. Louis; *Secretary and Treasurer*, T. J. Bradley, Boston; *Chairman Executive Committee*, J. A. Koch, Pittsburgh; *Members Executive Committee*, R. A. Lyman, Lincoln, and F. J. Wulling, Minneapolis; *Syllabus Committee*, A. Bolenbaugh, Richmond.

Respectfully submitted,

WILBER J. TEETERS, *Secretary*.

THE CHAIRMAN: The report is open for discussion and corrections, if there are any to be made. I think the report is correct.

The next order of business was the report on the Fairchild Scholarship which follows:

TO THE SECTION ON EDUCATION AND LEGISLATION OF THE A. PH. A., the AMERICAN CONFERENCE OF PHARMACEUTICAL FACULTIES, AND THE NATIONAL ASSOCIATION OF BOARDS OF PHARMACY:

In the report of last year on the Fairchild Scholarship, the President of the American Pharmaceutical Association was named Chairman of that Committee and the other members are: the president of the American Conference of Pharmaceutical Faculties, the president of the National Association of Boards of Pharmacy, and the editor of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, thus while the individual members of the Committee may change, it is really a permanent committee.

After the last annual meeting, President Frederick J. Wulling suggested to the Committee that the editor of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION be named Chairman; this suggestion was favorably acted upon by all the members, with the exception of the editor, who did not vote. The latter consented to accept, provided it met the approval of Mr. Fairchild. President Wulling wrote to Mr. Fairchild and his response was favorable.

The requirements of the candidates for the Fairchild Scholarship were named as follows: That the candidate shall be a graduate from a four-year high school course, that he have four years' drug store experience and pass an examination on questions to be prepared by a committee appointed by the Fairchild Scholarship Committee and that the examination be conducted under the supervision of the dean of a school of pharmacy belonging to the American Conference of Pharmaceutical Faculties, the president of the State Board of the State in which the examination was held or these officials might select representatives for the conduct of the examinations. The successful candidates shall have a right to choose the school in which he or she desires to matriculate.

The examination questions relate to elementary chemistry, elementary materia medica, practical pharmacy and prescription reading, and elementary business knowledge. The general scheme was outlined largely according to the rules of the British Fairchild Scholarship.

The Committee decided that the requirements for four-year drug store experience should be changed to two years of such experience and the Chairman was instructed to ask Mr. Fairchild whether he would be willing to have such change made. He answered as follows:

"Yes! it is quite agreeable to me to have the four years' drug store experience changed to two years; but with respect to any section of the plan of your committee please do not regard any wishes of mine as against the majority of the committee.

"I am very glad that it looks now as if the work might progress so that the Scholarship can be made available this year."

The letter is given in full so that Mr. Fairchild's coöperative spirit and interest may be shown evidencing that he desires to aid in every way possible and in accord with the interested bodies.

The Committee therefore proceeded with the preparation of examination questions through the appointment of a Special Committee consisting of Prof. Henry Kraemer, Prof. Wilber J. Teeters, Mr. H. C. Christensen and Mr. John Culley. The questions were prepared and the day set for the examination of candidates, namely, June 25, 1917. While a number of candidates promised to appear, only one actually came up for examination. It should be stated that the time was rather inopportune, the announcement was too late for most school catalogs and during vacation season. In order to make the Scholarship available, if possible, this year, and impossible to award the Scholarship without competition, an adjourned meeting for holding examinations has been called for September 26. It is to be hoped that the Conference and the National Association of Boards of Pharmacy will make it possible to have a number of candidates at that time. We are certain that your interest and appreciation of Mr. Fairchild's gift will make the award possible.

As indicated, the plan of award was based on that of the British Fairchild Scholarship but it is clearly evident if this does not seem practicable in this country, Mr. Fairchild will gladly consent to changes that may be deemed necessary.

The following suggestions have been made:

That the Scholarship be awarded to one who has finished one year in a school of pharmacy belonging to the Conference and successfully passed the prescribed examination.

That instead of proficiency in the subjects now required, the qualifying subjects should be English, arithmetic, physics, physiology, high school chemistry, and botany.

That the qualification be determined, not by the knowledge that the candidate has graduated from a high school course, but by actual test in the subjects regardless of the preliminary training and education.

That the Scholarship be awarded by competitive examination of senior students for post-graduate work.

That instead of the Scholarship being awarded by competition to a candidate regardless of locality in the United States, for the purpose of the award the United States be divided into four sections, the Northeast, the Southeast, the Northwest and the Southwest, and that the award be made the first year to a student of one section, next year to one of another section, until each section has had the opportunity for the Scholarship, and continue the award in this rotation.

It will, of course, be remembered that Mr. Fairchild offered the Scholarship *and we should as nearly as possible conform to his ideas when he first proposed his generous gift*. However, from the correspondence with Mr. Fairchild, it will readily be discerned that he desires to serve the best interests of pharmacy. Your consideration of the matter will therefore be appreciated by the Committee and your report awaited with interest. This year we hope that you will aid in making it possible to award the Scholarship under the rules formulated.

Sincerely,

E. G. EBERLE, *Chairman*.

THE CHAIRMAN: The Chair is not certain as to the method of procedure. The report of the Conference of the meeting is before us. One recommendation was made by the President with reference to the Fairchild Scholarship, and now we are discussing this recommendation with the report of Mr. Eberle, Chairman of the Committee on the Fairchild Scholarship.

E. G. EBERLE: Nearly all of the letters I have received are favorable to the plan that the Scholarship be awarded to a second-year student instead of one who has not attended a school of pharmacy.

THE CHAIRMAN: A motion is in order to receive and refer the report of the Secretary of the Conference for Publication.

C. A. DYE: I make such a motion.

(The motion was seconded, put to a vote and carried.)

THE CHAIRMAN: Now, we will take up this special item for consideration.

ROBERT P. FISCHELIS: I understood the recommendation of the Conference of the Faculties was to refer this matter to Mr. Eberle, and that he was to make a recommendation.

E. G. EBERLE: It should be understood that the Fairchild Scholarship Committee is really not a committee of any one of these bodies, but constituted of members belonging to these organizations. Whatever action is taken can only be recommendatory, if you feel so disposed, and I will be glad to confer with Mr. Fairchild.

THE CHAIRMAN: The Conference approved the President's recommendation, which simply asks the Conference that this Scholarship should be awarded to a senior student of a college of pharmacy of the Conference; that it should be awarded upon the basis of the applicant's scholastic training in the course of work required while in college and his fitness to do research.

R. P. Fischelis moved the adoption of the President's recommendation.

FREDERICK J. WULLING: Does the recommendation state the second year, or the senior year?

THE CHAIRMAN: The senior student.

FREDERICK J. WULLING: That would be the graduating year.

THE CHAIRMAN: The motion was to the effect that this Joint Session go on record as favoring the award of the scholarship to senior students; the Joint Session goes on record as favorable to the report of the President of the Conference.

Motion seconded.

ABSTRACT OF DISCUSSION.

CASWELL A. MAYO: This Scholarship was founded at my request, and after long consultation with Mr. Fairchild. When I conferred with him on the subject, we hit upon the expediency of having the Scholarship open to everyone. While he is perfectly willing to abide by any suggestions made, I always accentuated the fact that such Scholarship might attract a more desirable class of men to pharmacy than formerly. That was the idea in all our discussions. The idea is that there are a good many young men whose plans are indefinite, who might by the offer of a scholarship be induced to enter pharmacy. That is the thought I had at least, and one in which Mr. Fairchild decidedly agreed, of offering the Scholarship to a young man who was not already a student of a school of pharmacy.

There may be good and substantial and sufficient reasons to change. The difficulty we have had this year with the Scholarship indicates that there may be some reasons for changing the method of procedure.

THE CHAIRMAN: It seems to be evident from Mr. Fairchild's letter that he is amenable to suggestions, and it is just a matter of how we will gain the most for pharmacy in the awarding of this Scholarship.

C. A. MAYO: That has been his attitude from the beginning.

F. E. STEWART: I have not heard any reference made to the recommendations made by the Conference that this Scholarship should be awarded to one who has already graduated from our two-year course.

THE CHAIRMAN: The motion is now before the house, that the Joint Body approve the recommendations of the President of the Conference. We are now talking to that motion.

E. F. KELLY: How would you make the examinations fit the curriculum of schools requiring more than two years for graduation?

EDWARD KREMERS: I believe that young men will be attracted to pharmacy, not so much from the fact that when they enter pharmacy they have no tuition fee to pay for the first year, as from the possibilities that develop in the future. If we can advance pharmacy, I am sure the better young men and women of this country will want to enter pharmacy.

Just a word with regard to the wording of the resolution. It seems to me it is a trifle unfortunate to say it is to be given to a senior student. That is a subject of dual interpretation.

It may be given to junior students, after completing the first-year course whereby they become seniors for the next year. If we want to stimulate graduate work, then we ought to have that specified. May I make an amendment that graduate be substituted?

R. P. FISCHER: I accept the amendment.

THE CHAIRMAN: The maker of the motion accepts the amendment.

FREDERICK J. WULLING: I understood it was the desire of the donor of the Scholarship that it should go to a young man who has not yet entered school. If it is deemed admissible that the Scholarship be awarded to a graduate, that, I think, would be a very happy solution of our difficulty, provided it meets with the approval of Mr. Fairchild. I have thought right along that we should do what Mr. Fairchild wants us to do in this matter.

CHARLES E. CASPARI: In view of Mr. Fairchild's statement that he preferred to have the Committee settle this rather than consult his wishes in the matter, and in fact, there is only one scholarship, there seems to me no doubt it would do far more good to award it to a graduate in pharmacy rather than to a man not a student in undergraduate work. If we had one scholarship for each college, or more, I would say, let it go to one who has not entered a school, but since we have only one, I think the greater amount of good would be gained by granting the same to some desirable student deserving of it; if any student, a graduate student, rather than an undergraduate. As a member of the Committee on the President's address, it is the recommendation I would make.

CASWELL A. MAYO: I know Mr. Fairchild's view sufficiently to know that he only wishes the Scholarship to be administered in the very best way. I might relate an experience that I personally had, but I do not want it in any way to influence the members. Before entering a school of pharmacy I was a clerk in a drug store at a small salary and was questioning myself as to whether I would remain in pharmacy, when I was awarded the Peter Williamson Scholarship. With this deep feeling of indebtedness to that donor, I took the matter of a like scholarship up with Mr. Fairchild.

H. C. CHRISTENSEN: Inasmuch as the National Association of Boards of Pharmacy took action on this matter only in a recommendatory way, and as I have not made a report on our meeting, I would like to state that the Association went on record as recommending that the Scholarship be awarded on the basis of the second-year work. We did not hear anything of the graduation feature, and it seemed from our previous experience that the idea of awarding the Scholarship simply on high school graduation, that there was not anything to base the competitive examination on.

I agree with what has been said here entirely, that the basis should be graduation. Then there would be something on which to base competitive examination for scholarship, and I believe it would have a tendency to bring about competitive work, and make these applicants look forward to progress in pharmacy. I heartily agree with this proposition.

FREDERICK J. WULLING: Whatever action we take is also the action of the Board, as well as the Conference and this Section of the A. Ph. A., that the candidates for the Scholarship should be graduates of Conference colleges.

THE CHAIRMAN: Yes, it is so stated. The only change is that in connection with senior and graduate. I may say that the scholarship is awarded by the Fairchild Committee, and this action is simply recommendatory. This Committee and Mr. Fairchild are seeking light as to the best way of awarding this Scholarship to do the most for American pharmacy, so this is simply a discussion of the proposition by these three bodies, and then the matter will be considered by the Committee and Mr. Fairchild.

All those in favor of the motion will signify by saying "Aye." Contrary "No." It is carried, and is a unanimous vote.

The next matter on the program will be the report of the Fourteenth Annual Meeting of the National Association of Boards of Pharmacy, by Mr. Christensen, of Chicago. This follows:

REPORT OF THE FOURTEENTH ANNUAL MEETING OF THE NATIONAL ASSOCIATION OF BOARDS OF PHARMACY.

The Fourteenth Annual Convention of the National Association of Boards of Pharmacy was called to order in the Assembly Hall of the Claypool Hotel, Indianapolis, Ind., by President Lawrence C. Lewis, at 10.15 A.M., Monday, August 27, 1917.

Roll-call showed twenty-seven states represented as follows: Alabama, Arkansas, Connecticut, Florida, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Mississippi, Missouri, Nebraska, New Jersey, New York, North Dakota, Oklahoma, Pennsylvania, Tennessee, Texas, Utah, Vermont, Virginia, Wisconsin. Total number of delegates and associate delegates present, fifty-two. The address of welcome by Burton Cassaday, of the Indiana Board of Pharmacy, was responded to by John Culley, of the Utah board.

President Lewis invited D. W. Ramsaur, of Florida, to take the chair, and then proceeded with his presidential address. After calling attention to general conditions in pharmacy prevailing throughout the country on account of the war, he announced with much feeling the death of A. C. Wilson, of Iowa, late member of the Executive Committee; he also reported the death, during the past year, of C. Lewis Diehl, Wm. C. Alpers, Martin I. Wilbert and others, who had labored hard in the past to place pharmacy on a higher plane.

He then cited some of the activities of the Committee of the A. Ph. A. and the boards in the matter of the Fairchild Scholarship and said he hoped that during the next year a more practical plan would be adopted with regard to the awarding of this Scholarship. It was suggested later in the meeting that the Scholarship be awarded for the last year's work in a school of pharmacy instead of the first as this year. This it was thought would not only be the means of bringing more candidates to apply for the scholarship, but would also enable the Committee to adopt a more practical plan of award, basing examination on the first year's work in a school of pharmacy as well as high school and practical work.

Other recommendations of the president were as follows:

That the secretary and the chairman of the Executive Committee of the Association be appointed as a Committee on Necrology to draft suitable resolutions, and that the "In Memoriam" page in the Annual Proceedings be continued.

That the dues and reciprocal blank fees remain the same as in the past year, so that the chairman of the Advisory Examination Committee may be enabled to visit as many states during examination periods as possible and furnish such suggestions and information as may lead to continued progress toward higher and more uniform standards for state board examinations.

The Committee on the President's Address not only approved of this, but suggested further that the members of the state boards should visit their neighboring states while holding examinations and thus by personal interview acquaint themselves and study the methods and practices in use.

That a committee of three, consisting of the president, secretary and chairman of the Executive Committee, confer with the Committee on Time and Place of the A. Ph. A. with a view of having our annual convention a week earlier in August. The reason for this was given that it would insure a larger attendance of board of pharmacy members. Most board members are actively engaged in business and many handle school text-books so that it is imperative that they be at their places of business several days before the first of September, so as to have this part of their business in shape for the opening of schools.

That state board members be as liberal as possible in construing the "one year resident" clause in cases of applicants for reciprocity where the applicant complies fully with other requirements of the N. A. B. P. for reciprocity.

That the Association go on record as endorsing the Edmonds Bill, known as H. R. 5531, introduced by Honorable G. W. Edmonds, Philadelphia, and drafted by the National Pharmaceutical Service Association.

That state boards adopt more uniform fees for reciprocal registration in the various states. It was pointed out that fees varied from five to twenty-five dollars. A uniform fee of fifteen dollars was recommended, unless this would conflict with state laws.

In accordance with action previously taken by the Executive Committee, it was recommended that the Secretary be instructed to make application for membership of the N. A. B. P. in the National Drug Trade Conference, and on adoption of the report of the Committee on the President's Address it was so ordered.

From reports made by committees of the Association, it is very evident that the past year has brought forth more good than any previous year since the Association was organized. The report of the chairman of the Advisory Examination Committee showed that as secretary and chairman of this Committee he visited fourteen states during the past year and that in all of these satisfactory progress was being made in examination work; also, four states, Colorado, Nevada, Pennsylvania and South Carolina, were added to the active membership list of the Association during the past year.

The following officers were elected: *President*, W. P. Porterfield, Fargo, N. D.; *First Vice-President*, J. A. Weeks, Ballinger, Texas; *Second Vice-President*, W. R. Jarrett, Oklahoma City; *Third Vice-President*, D. E. Haddon, Alta, Ia; *Secretary*, H. C. Christensen, Chicago; *Treasurer*, Charles H. Skinner, Windsor, Vt.; *Members of the Executive Committee*, John Culley, Ogden, Utah, and H. E. Purdy, Derby, Conn.

H. C. CHRISTENSEN, *Secretary*.

C. E. Mollett moved that the report be received and being seconded was on vote adopted:

CHAIRMAN R. A. LYMAN: President Stone was on the program for an address but he is absent so this finishes the business in which we are concerned as a joint body. I will now call upon Mr. Kuever, who will act as Chairman and finish the program.

CHAIRMAN R. A. KUEVER: We have two papers from the first session on Wednesday, and we will hear those first. They are: "The School of Pharmacy and the Profession," by C. F. Nelson, and "Graduate Instruction in Pharmacy in the United States," by Edward Kremers.

These were read, discussed and referred for publication. (See this issue.)

The next paper was by C. H. LaWall on "A Bad Spell, or Who Mixed the Letters." (See p. 1063, December issue.)

The following papers, owing to the absence of the authors, were read by title and referred for publication:

"Privately Owned Schools and Colleges of Pharmacy," by Edward Spease.

"Are Colleges of Pharmacy Devoting Sufficient Time to Prescription Laboratory Practice?" by A. W. Linton.

"The State Legislature," by W. H. Cousins.

The next order of business was the presentation of the report of the Committee on Drafting of a Model Pharmacy Law by Chairman F. H. Freericks.

(This report with abstract of discussions will be printed in a later issue.)

A motion was made by H. C. Christensen and seconded by C. E. Mollett that a rising vote of thanks be extended to this committee for its faithful work, and this was afterward amended, requesting the incoming President to reappoint the same committee and that it be empowered to continue the work. It was unanimously carried.

Chairman Freericks expressed the hope that the final report would be made at the next annual meeting of the Association.

The meeting of the Section on Education and Legislation was then adjourned.

REPORT OF THE COMMISSION ON PROPRIETARY MEDICINES OF
THE AMERICAN PHARMACEUTICAL ASSOCIATION,

1916-1917.*

TO THE COUNCIL AND MEMBERS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION:

The Commission on Proprietary Medicines submits for your consideration the following report of its activities for the year 1916-1917:

Since its last report the Commission has suffered the loss by death of two of its most valued and useful members, Mr. Martin I. Wilbert, of Washington, D. C., and Mr. Thos. F. Main, of New York City.

MARTIN I. WILBERT—THOMAS F. MAIN.

Mr. Wilbert was one of the best-known pharmacists in the United States, and one of the most conscientious members and ablest workers of the American Pharmaceutical Association.

He became a member of the Commission at the time of its creation, and during his remaining life gave close attention to the problems incident to the manufacture, advertising, sale and use of package medicines of a proprietary character; and worked faithfully with his fellow-members of the Commission to formulate and secure the adoption of principles designed to safeguard the public interest and to place the proprietary medicine industry upon a proper and acceptable basis.

He was an honest, earnest and continuous student of the reciprocal relations between pharmacy, medicine and the public, and devoted the utmost energies of his too short life to work for the common good.

Mr. Main was also one of the original members of the Commission and until the day of his death was constant in his efforts to contribute to the success of its work.

Mr. Main's many years of experience as manufacturer, wholesaler and retailer fitted him peculiarly for service on the Commission and to render unbiased judgments upon questions affecting the several divisions of the drug trade.

To all who knew him he was the embodiment of honor and integrity, and one whose broad-mindedness and gentleness of manner endeared him to those with whom he was brought in contact.

The surviving members of the Commission desire here to place on record their sense of loss and profound sorrow occasioned by the death of their two departed colleagues, whose virtues and eminent services they will ever hold in faithful remembrance.

Action of Associated Advertising Clubs with Respect to Medical Advertising.—By invitation, the Chairman of the Commission on Proprietary Medicines attended the mid-year conference of the National Vigilance Committee of the Associated Advertising Clubs of the World, held at Indianapolis, Ind., March 5, 1917, and presented a paper dealing with the general subject of medical advertising and with the work of this Commission.

Following a general discussion of the paper and of the general subject of medical advertising, the Vigilance Committee appointed a sub-committee to formulate standards for proprietary package medicines advertised to the general public, and invited the members of the Commission to meet with and take part in the deliberations of such sub-committee.

The Sub-Committee thus created met at the LaSalle Hotel, Chicago, March 27th, at which meeting the Commission on Proprietary Medicines was represented by the Chairman, who was the only member able to be present.

After a discussion covering almost an entire day, the Sub-Committee formulated a list of principles to be regarded as standards for proprietary package

* Presented at the Indianapolis meeting, 1917.

medicines advertised to the general public, and adopted a code of rules and regulations for the investigation of such medicines.

The report of this Sub-Committee was at a later date presented to the National Vigilance Committee of the Associated Advertising Clubs at its annual convention held in the city of St. Louis, June 4, 5 and 6, 1917, when the principles and regulations were completed and approved, and now constitute the code by which the National Vigilance Committee will judge the character of package medicines advertised in so far as it shall be called upon to pass judgment upon the same.

The standards and regulations as promulgated by the National Vigilance Committee are as follows:

STANDARDS FOR MEDICAL ADVERTISING.

There is a legitimate field for the advertising of ready-made package remedies intended for the domestic treatment of common ailments, providing the following requirements are met:

(1) *Appropriate Use.*—The advertised medicine must be appropriate for use in the particular affections for which it is recommended and must not unfavorably affect the course of the disease for which it is recommended.

(2) *Prescription Fakes, Concealment of Proprietary Character.*—The preparation must not be named or advertised in such a way as to conceal its proprietary character and lead the purchaser to believe that it is a simple chemical or vegetable drug ordinarily purchasable in small quantities instead of a proprietary mixture or substance.

(3) *Methods of Marketing.*—Ordinarily the preparation should be one which is regularly offered to the public through the usual trade channels, *i. e.*, through regular wholesale and retail dealers in ready-made medicines, and thus subject to inspection by the authorities charged with the enforcement of state food and drug laws.

(4) *Alcohol Content.*—If the preparation contains alcohol, it must be sufficiently medicated to prevent its use as an intoxicating beverage, and in addition to this requirement, the proportion of alcohol present must not be greater than is properly necessary to hold in solution in permanently active condition the essential constituents of the preparation, and to protect the preparation against freezing, fermentation, or other deleterious change.

(5) *Content of Habit-Forming Narcotic Drugs.*—If the preparation is one which is capable of being used internally, whether recommended for internal use or not, it must not contain cocaine, nor shall it contain opium or any of its alkaloids or their derivatives in greater proportion than those specified in Section Six of the Federal Law, commonly known as the Harrison Act, and it shall also contain other active drugs in such proportion that the use of the preparation will not be likely to create a drug habit, nor satisfy such a habit when previously existing.

(6) *Remedies for Children's Use.*—If intended for administration to infants or children, the preparation must not contain cocaine, or opium or its alkaloids, or their derivatives in any proportion whatever.

(7) *Activity of the Preparation, Cautions against Misuse.*—The preparation must be of such character that it will not be liable to endanger life or health when used in accordance with the accompanying instructions, and if the preparation is one which is liable to occasion injury when improperly used or when used to excess, the accompanying label and literature must bear instructions tending to guard against such improper or excessive use.

(8) *Immoral or Illegal Purposes.*—The preparation must not be intended for use as an abortifacient nor for use for any other immoral or illegal purpose, nor must it be advertised or recommended either directly or indirectly as an abortifacient or for any immoral or illegal purposes.

(9) *Incurable and Contagious Diseases.*—The preparation must not be advertised or recommended, directly or by inference, as a cure for diseases or conditions which are generally recognized as incurable by the simple administration of drugs, or for the cure of contagious diseases or those sufficiently acute to require treatment by a qualified medical attendant.

(10) *Conformity to the Federal Food and Drugs Act.*—Neither the label on the package nor any of the accompanying literature shall bear or contain any statement in conflict with the misbranding provisions of the Federal Food and Drugs Act.

(11) *Advertising Not Accompanying the Package.*—Advertising not accompanying the package shall conform substantially to the statements on the label, carton, or in the accompanying circulars as to the origin, composition or character of the preparation, or concerning its curative or remedial value.

OUTLINE OF A PLAN FOR THE INVESTIGATION OF PACKAGE MEDICINE ADVERTISING.

The National Vigilance Committee approves the following plan for the investigation of the advertising of proprietary package medicines to the public:

(1) The requirements for proprietary package remedies intended for direct sale to the general public approved by the Commission on Proprietary Medicines of the American Pharmaceutical Association, as modified by the Vigilance Committee, are hereby adopted as the requirements of this committee in so far as they may be applicable to the work of the committee, and in so far as they are consistent with the regulations herein contained *or which may hereafter be adopted by the Vigilance Committee.*

(2) In considering the claims of curative or medicinal value made for a proprietary medicine, the Vigilance Committee will not undertake to decide between the views of rival schools of medicine, or between groups of physicians which maintain antagonistic opinions as to the medicinal value of the important constituents of any such proprietary medicine.

(3) In view of the difficulty of demonstrating the curative value of drugs by absolute proof and of the wide difference of opinion maintained by the various schools of medicine respecting the curative or medicinal value of numerous drugs, the Vigilance Committee will confine itself in the main, to a consideration of the honesty and good faith of the claims which are made in the advertisements to be considered.

(4) Evidence offered to justify claims of remedial value must be of substantial character, or of such a character as would ordinarily appeal to men of good judgment and not personally interested in the results of the decision.

(5) Evidence as to the medicinal value of a preparation or of the drugs used therein shall be of the same kind and quality as would ordinarily be considered sufficient to justify the good faith of a physician in using the same drugs in the same affections as those for which the preparation is advertised.

(6) As admissible evidence within the meaning of Regulations 4 and 5, the Vigilance Committee will consider any or all of the following:

a. Either oral or sworn written statements as to the use by legally qualified practicing physicians of the drugs contained in such preparation in the treatment of the affections for which the preparation is advertised.

b. Either oral or sworn written statements of the maker or advertiser as to the truthfulness and good faith of the claims made for an advertised preparation, or of the names and addresses of persons who have used such preparation with satisfactory results.

c. Affidavits of persons who have used the advertised preparation for the purpose for which it is advertised; but every such affidavit shall be signed by at least one disinterested witness in addition to the officer before whom the affidavit is made, which witness shall also certify that the contents of the affidavit were read in the hearing of the affiant and that the latter assented.

d. The statements of medical journals having general circulation among medical practitioners representing any school of medicine as to the medical properties and uses of any preparation or of any drug or medicinal substance used as an ingredient of such preparation.

e. The statements of text-books or manuals of materia medica, therapeutics or practice of medicine, or other works of reference in common use by legally qualified physicians of any so-called school of medicine, as to the medicinal uses or value of the drugs contained in a preparation.

f. Any other testimony which the Vigilance Committee may deem competent evidence as to the medicinal value of the preparation, or as to the truthfulness and good faith of the advertised claims made therefor.

Any information as to the composition of a proprietary medicine which may be communicated to the Committee will be preserved in confidence by the Committee, if so requested by the party making the communication, provided such request is made before the information is submitted.

(7) In all matters of dispute between the advertiser and Vigilance Committee, the burden of proof shall be upon the advertiser to establish the truth of his contention to the satisfaction of the Committee.

(8) Within the discretion of the Vigilance Committee a written answer to any objection which may be made to any advertisement may be accepted, or the advertiser may be requested to appear in person or by representative for the presentation of evidence or argument.

(9) Copies of the requirements for advertised proprietary medicines adopted by the Vigilance Committee and of these regulations shall be furnished on request to any advertiser or proprietor of an advertised package remedy, and to any newspaper advertising association or other agency of publicity.

The importance of this action of the National Vigilance Committee can hardly be over-estimated. The Associated Advertising Clubs is probably the strongest existing influence connected with the advertising business, and its ability to investigate and expose fraudulent advertising schemes is constantly increasing.

The members of the National Vigilance Committee are practical men, with judgments matured by many years of experience and who are thoroughly imbued with the doctrine that truth in advertising is essential both to those who have wares to sell and to those who deal in advertising.

We may expect with confidence that the efforts of the Vigilance Committee will result in the gradual elimination of the advertisement of fraudulent or valueless package medicines from the columns of the public press and that they will also promote the more truthful advertisement of those which, though possessed of merit, are frequently extravagantly extolled.

Effect of the Harrison Act on the Sale of Package Remedies Containing Habit-Forming Narcotic Drugs.—As a part of its work during the past year the Commission has made an investigation of the effect of the Federal Anti-Narcotic Act, commonly known as the Harrison Law, upon the sale of habit-forming narcotic drugs and of package medicines containing them. Letters were addressed to members of the wholesale drug trade, distributed generally over the United States, asking for information as follows:

1. The extent of any observed increase or decrease in the sale of drugs covered by the Harrison Law, since its enactment.
2. The extent of any observed increase or decrease in the sale of non-proprietary preparations, such as paregoric, Godfrey's cordial, and Bateman's drops, exempted by Section Six of the Harrison Law.
3. The extent of any observed increase or decrease in the sale of proprietary package remedies containing the drugs covered by the Harrison law and exempted by Section Six of that law.

Replies were received from 102 wholesale drug firms, located in 37 states, from which the following data have been compiled:

The replies to Query No. 1 indicate conclusively that since the enactment of the Harrison law there has been a large decrease in the sale of habit-forming narcotic drugs covered by that act for the sale of which an official order blank or physician's prescription is required, the average of all the decreases reported in figures amounting to no less than 66.3 percent.

The answers to Query No. 2 indicate that there has been a very considerable increase in the sale of *non-proprietary* articles containing opium, such as paregoric and Bateman's drops, amounting to an average of 118 percent for the firms which give definite figures for their increased

sales. These increased sales, however, fall far short of replacing the decreased sales reported for the drugs included in Query No. 1.*

The answers to the query respecting increased or decreased sales of *proprietary medicines* containing narcotic drugs were agreeably surprising to the members of the Proprietary Commission. It had been assumed as a matter of course that the inability of drug addicts to procure their accustomed supplies of opium or its alkaloids would prompt them to purchase package remedies containing these drugs among their constituents. Such, however, does not seem to have been the case, as indicated by the reports of wholesale druggists.

Fifty wholesale druggists report that they have noted little or no change in the volume of sales of proprietary preparations containing narcotics, notwithstanding the very general increase in the volume of business in other drug lines.

Twenty-six firms report *decreases* in the sale of such preparations, which they estimate at figures ranging from 10 to 80 percent.

Thirteen firms, without naming any percentage of reduction, report that their sales of such proprietary articles have decreased or largely decreased.

Three report that the sale of such articles in the districts in which they mainly do business is practically non-existent.

Several firms report that they do not handle such preparations, and several other firms do not make any answer to the query.

Eight firms report some *increase* in the sale of proprietaries of this class, generally stated to be slight, or very slight, but in two cases estimated at 25 percent. These reported increases appear to have been in connection with only two preparations, which are said to include other narcotic drugs, such as alcohol or ether in addition to their opium content. These particular preparations will be again referred to in a later section of this report.

The firms reporting decreases in the sale of proprietary articles containing habit-forming drugs offer one or more of the following reasons in explanation:

1. That the general notoriety given to the subject of habit-forming drugs by the enactment of the Harrison Law has tended to make purchasers wary of preparations containing such drugs, and has also prompted retail pharmacists to advise their customers against the purchase of such preparations.

2. That several of the more objectionable preparations of this class, *i. e.*, those which contain narcotics in sufficient proportion to make their use desirable by addicts, have been entirely withdrawn from the market by their manufacturers.

3. That the quantities of habit-forming drugs contained in certain other proprietaries have been reduced to such an extent that their narcotic effect is negligible in comparison to the effects of the associated drugs, so that habitués not being able to obtain the desired effect from the combinations do not purchase them.

From the above it would appear that the sale of proprietary medicines containing habit-forming drugs does not at the present time constitute any serious menace to the continued efficiency of the Harrison Law, and that if any further federal legislation is needed with respect to habit-forming narcotic drugs it should rather be made to apply to the official preparations of the Pharmacopoeia and National Formulary, than to the usual non-official preparations of the market.

The Origin and Introduction of Package Remedies.—Acting on a suggestion of our lamented colleague, Mr. M. I. Wilbert, the Commission has this year made a preliminary study of the origin and introduction of the package remedies commonly known as "patent medicines."

It was Mr. Wilbert's belief that, contrary to general opinion, the drug trade has had but a minor part in the introduction of patent medicines to the public

* The answers to these two queries are dealt with more in detail in a separate paper presented by the Chairman to the National Drug Trade Conference at its last meeting in Washington, held in May of the present year.

attention, and that the major responsibility for the introduction of such remedies rests with the medical profession, which opinion seems to be in some measure borne out by the result of our investigations.

In accordance with Mr. Wilbert's suggestions, letters were addressed to about 250 makers of proprietary medicines scattered quite generally over the United States, presenting a series of questions concerning the points upon which information was desired. Each letter was accompanied by a stamped return envelope, and the persons to whom the questions were addressed were advised that information furnished would be used in a statistical way only, and that if given as "confidential" it would be so preserved. About 100 manufacturers responded with more or less completeness to our questions, and upon these responses, supplemented by personal correspondence when the information first given was not satisfactory or sufficiently definite, the following study has been based.

On a study of the letters it was found that many of the answers related to toilet articles or preparations which could not properly be regarded as remedial in character, and these, together with other answers which seemed to be evasive or indefinite in their terms, were rejected, after first attempting to secure more satisfactory information by further correspondence.

After these various eliminations were made there remained answers from 79 makers of proprietary remedies giving information respecting 317 package preparations, which seemed to be of such definiteness as to entitle them to serious consideration, and from a tabulation of these answers the following data have been compiled:

Of the 317 preparations reported upon, 187, or 58.99 percent, are reported as originating in the form of physicians' prescriptions, the information being accompanied by the names and addresses of the physicians whose prescriptions were used as the foundation of the medicines named.

Of the 187 remedies reported as originating as physicians' prescriptions, 97, or 30.59 percent of the whole number of preparations studied, were introduced and first sold in package form by the physicians who claimed to be their originators.

The remainder of the 317 remedies are reported to have originated in the following ways:

The formulas of 28 package remedies are admitted to have been adopted or "adapted" from standard medical or pharmaceutical literature, such as the Pharmacopoeia of the United States, the French Codex, the British Pharmaceutical Codex or the National Formulary.

The formulas of 73 preparations are claimed to have been devised by chemists or pharmaceutical chemists, some of whom admit their indebtedness to physicians' prescriptions or to medical or pharmaceutical literature, while others claim entire credit for the creation of the formulas reported upon.

The formulas of the remaining 29 preparations are reported as having come to the manufacturers in the form of recipes which have been long in the possession of certain persons or families, and highly prized because of their real or supposed efficacy in the treatment of certain ailments. In such cases all traces of the real origin of the formulas have usually been lost or forgotten. Some preparations of this class have been continuously on the market for periods ranging from fifty to eighty years or more.

Of the preceding it will be observed that there are three classes of cases in which the formulas are not attributed directly to physicians' prescriptions, namely, those adopted or adapted from medical or pharmaceutical literature, those claimed to have been devised by pharmacists or pharmaceutical chemists, and those the origin of which is unknown, or which came into the hands of their present

proprieters in the form of what are commonly known to the trade as "family recipes."

Persons familiar with the manner in which formulas are introduced into medical and pharmaceutical literature, and with the manner in which so-called family recipes originate, will recognize that they are but a very short distance removed from physicians' prescriptions, and also that those claimed to be devised by pharmaceutical chemists are very largely based upon physicians' prescriptions, either directly or upon printed formulas appearing in medical literature.

In studying the answers one is struck by the considerable number of names eminent in American Medicine as authors of text-books on materia medica or practice who have been responsible either openly or under cover, for the introduction of remedies of this class. One expedient sometimes resorted to in naming such medicines has been to call them by the first name of the originating physician. For example, if the physician's name was Dr. X. Y., the preparations were put on the market as Dr. X.'s remedies.

In some instances the physician's prescription has apparently been used without any knowledge or connivance on the part of the physician himself, but in numerous other cases the physician has given permission for the manufacture and sale of the preparation as a package remedy in return for a cash bonus or for a royalty on the medicine sold. In many cases where royalties were at first paid they have later been extinguished by the payment of a lump sum in cash or by the acceptance of a certain amount of stock in the manufacturing concern.

Another interesting fact brought out from the study of the letters is that of late years, and especially since the passage of the Food and Drugs Act of 1906, it has become increasingly common for manufacturers of package remedies to submit their formulas and literature to one or more physicians or pharmaceutical chemists for study and revision, and to make changes in the formula or the literature in accordance with the recommendations received.

An illustration of the adage that "Doctors will differ" is presented in one case where a manufacturer, desirous of availing himself of the best of authority, submitted the formula of his preparation and the accompanying literature to a committee of three physicians representing three different medical colleges. The formula was approved by all three of the physician experts who, however, recommended some changes in the claims made in the literature. These suggestions were adopted and incorporated on the label and in the literature and, about a year later, to his surprise, the proprietor was cited under the Food and Drugs Act for issuing a misbranded preparation, *i. e.*, for making claims in the literature which, in the opinion of the authorities at Washington, were false and misleading. The puzzled manufacturer inquires, "How in —— can a man know what to do when he gets the opinion of the best medical experts on his labels and is then arrested for selling a fraudulent medicine?"

One can understand the puzzlement of this manufacturer when he reads the general medical literature pertaining to the various articles of the materia medica. There are very few items of the materia medica that have not been extolled by therapeutists in medical journals or in the text-books which they have written for their students in far more laudatory terms than the average maker of a package remedy would dare claim for his preparation.

A question which suggests itself in this connection is, to what extent is the manufacturer of a proprietary medicine justified in relying upon the statements found in books generally regarded as standard authorities on materia medica and therapeutics when he composes his claims for his preparation? Should he be permitted to recommend his preparations with the same liberal terms of praise that the professor in a medical college is permitted to bestow upon the drugs used as ingredients of such preparations in his lectures to his students, or the writer in a medical journal or the author of a text-book addressed to his colleagues in the profession; or is he to be held to a higher and stricter accountability for his claims of therapeutic value?

Cases of Drug Addiction or Alcohol Habit, or of Injuries Resulting from the Use of Patent Medicines.—The resolutions providing for the creation of the Commission on Proprietary Medicines make it a part of the duty of the Commission to inquire whether and to what extent package medicines contain alcohol or habit-forming narcotic drugs in sufficient proportions to render them likely to create an alcohol or drug habit, or render them liable to cause injury in the hands of the laity.

As an introduction to this particular feature of its work, the Commission early in the year requested the editors of journals addressed to the drug trade within the United States to print the following announcement:

"TO MEMBERS OF THE DRUG TRADE."

"The Commission on Proprietary Medicines of the American Pharmaceutical Association is desirous of obtaining reliable information respecting injuries alleged to have been caused by the use of proprietary medicines, or respecting the alleged improper use of such preparations.

"The assistance of members of the drug trade toward the securing of definite information of the kinds indicated below will be greatly appreciated by the Commission:

"Accounts of specific cases of harmful results following the use of proprietary medicines.

"Accounts of specific cases of narcotic drug habit resulting from the use of proprietary medicines, or of the use of proprietary medicines for the satisfaction of a habit previously existing.

"Accounts of specific cases of the habitual use of proprietary medicines as substitutes for the usual alcoholic beverages.

"Information bearing upon the above should state facts and circumstances that are capable of verification."

The announcement was printed in practically every drug journal in the United States, many of whose editors were also kind enough to comment liberally upon the subject and to urge their readers to comply with the Commission's request.

The replies to our request for information have been few in number, indicating either that injuries from the use of package medicines are rare or that druggists are not willing to coöperate with the Commission by supplying such information as they may possess. To such as have responded with information the Commission hereby expresses its thanks.

One prominent Indiana pharmacist reports his personal knowledge of three opium addicts who have made use of a certain proprietary cholera and diarrhoea medicine as a substitute for morphine. This preparation, while the opium content is within the exemption of the Harrison Act, is stated to contain alcohol and ether in addition thereto, the combined narcotic effect being apparently sufficient to give the opium addict some measure of relief when he cannot obtain the stronger

drug. This same preparation has also been reported upon unfavorably by several of those answering inquiries relative to the effect of the Harrison Act, which are set forth in another section of this report. The Commission is at present in correspondence with the manufacturers of this proprietary, and will report the result of such correspondence at some future date.

The Commission has also received a printed pamphlet issued by a noted authority on the treatment of drug addiction, in which the statement is made that the author has knowledge of cases of drug addiction resulting from the use of proprietary medicines. The Chairman of the Commission addressed the author personally, requesting specific information as to the cases of drug addiction referred to for utilization in this report. The Chairman was disappointed to receive a reply from the author to the effect that this information was of a strictly confidential and professional nature and could not be imparted to the Commission.

Some partial information bearing on the subject has also been received through the courtesy of the City Chemist of one of our larger cities in which the health authorities are conducting a special campaign against valueless or dangerous proprietary remedies, based on information obtained by a canvass of physicians of the city as to the use of such medicines by their patients, or otherwise coming within their observation.

Unfortunately the information which the City Chemist could supply was of such a nature, or was of such an indefinite character, that it has a very limited usefulness for the purposes of this report.

One of the preparations complained of was a hair stain alleged to have occasioned dermatitis in the users, while two other preparations which were named are supplied directly to their patients by advertising physicians and are not obtainable through the regular drug trade, and therefore do not properly come within the scope of the work assigned to this Commission.

Of the complaints pertaining to preparations which can properly be regarded as coming within the category of patent medicines, the following are important:

Fourteen cases were cited by physicians where certain proprietary medicines were taken without benefit, or where the patient grew worse after taking the medicine.

Two cases were cited by physicians of the use of a proprietary medicine for one ailment when the patient was in fact suffering from a different ailment, and grew worse because of failure to receive early treatment for the affection from which he was suffering.

Two cases were cited of the death of infants resulting from the use of a proprietary medicine containing a narcotic drug.

One case was cited of the creation of a morphine habit by the taking of a proprietary dyspeptic remedy.

The names of the preparations complained of were given, but not the names of the persons who used them with such unfavorable results nor the names of the reporting physicians.

As the nature of the cases cited seemed to be right in line with the work of the Commission, an effort was made to obtain such definite information of the cases cited as would justify naming the remedies complained of in this report. Our correspondent, the City Chemist, was personally willing to comply with our request for more definite information, but found that the names of the patients who had received injury through the use of the preparations named, or who had

failed to receive benefit from their use, were held as official secrets and could not be imparted to the Commission.

Other leads which at first appeared promising on further investigation proved to be equally disappointing; that is, the persons claiming to possess such knowledge either revised their statements when asked to make them more definite, or claimed to possess their information in a confidential way, and were therefore unable to give the Commission any specific data by which independent investigation could be made.

As the Commission has not been able to verify any of the alleged cases of injury resulting from the use of proprietary remedies, it does not feel justified at present in reporting the names of the preparations concerning which complaints have been made.

The Commission intends to continue this particular part of its investigation during the coming year, and hopes to be successful in obtaining some accurate information upon the subject in time for its next report.

Other studies of special features of the matters assigned to the Commission for investigation have been initiated during the past year, or have been continued from former years, but are not sufficiently advanced to report upon at the present time. Some delays have been unavoidable owing to the much-regretted deaths of two of our most active and valuable workers, Messrs. Wilbert and Main, to whom the duty of making several special studies was entrusted. It is hoped that by the time of our next annual convention these subjects will be in better form for presentation to the Association.

Respectfully submitted,

J. H. BEAL, Chairman,

GRADUATE INSTRUCTION IN PHARMACY IN THE UNITED STATES.*

BY EDWARD KREMERS.

When in 1821 the "School" of the Philadelphia College of Pharmacy offered its first course of evening lectures to the apprentices of Philadelphia, the first step toward the realization of systematic instruction in pharmacy had been taken. No doubt, this early experiment in continuation work reflected a need that had been felt by those who had given the subject any thought whatever. In part, however, it must be looked upon as a counter movement to the proposed step toward pharmaceutical education contemplated by the Medical Faculty of the University of Pennsylvania. As an assertion of professional independence it was highly to be commended. Viewed from the point of view of Peter K. Lehman,

* Presented before joint session of Section on Education and Legislation, A. Ph. A., of the American Conference of Pharmaceutical Faculties and National Association of Boards of Pharmacy, Indianapolis meeting, 1917.

who expressed his commercial ideas in the following words: "This won't do, the University has no right to be taking our boys away at noon to make them M.P.'s," it was equally to be regretted. It would be useless, however, to discuss now, almost a century after this memorable event, what course pharmaceutical education in this country might have followed had a great university taken the initiative instead of leaving this important first step to men who saw in their apprentices, not so much the future pharmacists, as means to an immediate end.

For many a decade the road of the more ideally inclined members of the newly organized colleges was not an easy one. When, in 1789, the French apothecaries changed their organization from that of a guild of apothecaries to that of a college of pharmacy, they thereby declared to the French people that they wished to be regarded as a body of professional men and no longer as a guild of trades people. In this, their decision, they received the approval of their king. When the Philadelphia druggists in 1821 organized first as a College of Apothecaries—the name being changed very soon to that of College of Pharmacy—they likewise declared to the new world that they desired not only their independence of medicine, but that they were willing to assume the educational responsibilities of a profession. How lightly this obligation was taken by most of the members becomes apparent from the long list of those who dropped by the way as soon as the efforts of the medical faculty had been frustrated, and from the short list of names of those who were determined to strive toward the goal.

The beginnings were modest indeed. A single course of evening lectures by several medical men was all that was attempted. Pharmacy had declared its professional independence of medicine, but it had to call upon the older sister profession for its teachers. If the difficulties in Philadelphia were great, in other eastern cities, where local colleges were incorporated, the attempts either failed in large part, or, as was the case in Boston, no serious attempt at instruction was made at all for a number of decades. No wonder that the endeavor to secure educational coöperation in the first Conference of Colleges of Pharmacy did not outlast a decade.

If, in 1821, the somewhat grandiose attempt to initiate pharmaceutical instruction at the University of Pennsylvania met with failure, the small beginnings made by the University of Michigan in the sixties were more successful and gradually led to the movement, now all but universal, of pharmaceutical education by the state. Great as were the sacrifices made by such men as Squibb and others who gave not only their time and energy, but their money as well, the effort of the individual could not equal the effort of the state demanded by its druggists and supported by the entire citizenship of tax payers.

Whereas the evening courses at Philadelphia and elsewhere were of the type of the German *Fortbildungsanstalten*, after which our quite recent continuation schools are modeled, Michigan demanded the entire time and attention of her pharmacy students and made laboratory instruction the most prominent feature of the curriculum. Though Michigan was not admitted to the first Conference, yet her educational system prevailed, whereas the Conference was broken up. State university after state university has entered the field of pharmaceutical education with laboratory instruction as its backbone, and college after college has

slowly, but with resolve, added, first one modest laboratory course, then another, until laboratory instruction has become firmly established in all of them.

When the state universities entered the field of pharmaceutical instruction, they did not place the pharmacy student on a par with the regular students of their colleges. The entrance requirements were of a lower order, the time required for the completion of the course was shorter by half and even more than the conventional quadrennium. It is true the older colleges of pharmacy had no educational entrance requirements whatever, and even when the evening work was gradually displaced by day work, the actual time required was much less than that required by the universities. However, the prevalent university standards of pharmaceutical education suffered by more direct comparison.

The third step, *viz.*, the one to offer to the American student of pharmacy a course on a par with the conventional A.B. course of our colleges and universities was taken in 1892. It was received with much ridicule by the professors of the older colleges and did not even receive the condemnation of faint praise by the university teacher who had taken the very important step of placing pharmaceutical instruction on a thorough laboratory basis. However, it persisted, though in but a small way. Intended primarily as an ideal, it was soon found practical. More than ten years ago a university president referred to it as the only course to which every prospective pharmacist should aspire; a college dean has more recently heralded it as the salvation of pharmaceutical education in this country.

Thus was laid the foundation for graduate, not post-graduate work, in pharmacy. The subject of post-graduate study may be an important one, but it is not the topic of this paper. By graduate study is meant that type of educational work which is recognized as such by both the Association of American Universities and the Association of State Universities. Just as the quadrennium of the college rests on the four years of high school or academy, so the triennium of graduate study is based on the quadrennium of the college. As the work of the college implies something more than work done after the high school has been absolved, namely, study of a higher type, so graduate work implies something more by far than a continuation of study on an undergraduate plane after the coveted bachelor's degree has been received. Graduate study stands for work of the highest order given in course by the highest institutions of learning in the country.

Such work could not develop over night. It is not sufficient to map out a three years' course of study on paper. Just as the old colleges, when they inaugurated the evening courses for their schools, found that they could not supply the instructors from their own ranks for the modest courses of lectures, so the undergraduate college, not only in pharmacy, but in all lines of human endeavor, found that teachers for graduate study had first to be trained. This training was had—again in almost all lines—mostly at European universities. As France gave American pharmacy the college idea, *i. e.*, the closed corporation of the masters of the profession; as England gave us the idea of the classical college; so Germany gave us the idea of professional education in all branches and grades by the state. Moreover, she gave us the highest type of education, that which we in this country choose to designate graduate study. Hence it was in Europe, and more particularly in Germany, that not a few of our scientists received at least the final touches

of their higher education. Pharmacy constituted no exception to the rule. It is needless to state that just as not a few old-time self-made druggists were also good pharmacists, so individual teachers of pharmacy were imbued with the spirit of research, the basis of the graduate teachers' instruction, without crossing the Atlantic. Foreign journals and other publications kept alive the spark which their own individuality had kindled within them.

It is significant that the origin of graduate pharmaceutical instruction had its beginnings in the collateral sciences rather than in pharmacy proper. To anyone who has followed the trend of pharmaceutical education in this country this becomes readily apparent; and, in the light of the historical development of pharmaceutical education, it is easily understood.

Now, what should constitute graduate instruction in pharmacy?

When your speaker matriculated in the Philosophical Faculty of the University at Bonn, he was requested to inscribe his name in the Album of that faculty and the dean thereof extended to him the right hand of fellowship. The significance of these symbolic acts is this, that the student of the graduate faculty is regarded as the junior associate of the professor. The relation is no longer that of teacher and pupil, but of joint seekers after the truth, the professor being the senior, the student the junior member of this partnership. It is that of master and disciple, such as obtained in Aristotle's academy; not that of master and apprentice, a relation that obtains in the trades. It is this relationship that is characteristic of graduate work as contrasted with that of undergraduate study; though it may be necessary to emphasize that there are no hard and fast lines in study any more than in nature.

The relationship, however, is not likely to be that of one disciple to one master teacher; it is not that of a Mark Hopkins at one end of the log and a student at the other end thereof. The best opportunities for graduate work are not even found in the isolated college, but in the *universitas litterarum* with its diversified interests the aggregate of which creates the graduate atmosphere. It is the seeking of truth along many lines that stimulates the seeker of truth along the one line of endeavor to which the human being is of necessity largely restricted.

Referring primarily to undergraduate instruction, the late President Bascom, in "Things learned by living," makes the following statement: "There seem to me to be four primary qualities in good instruction, the power to impart information, the power to guide the pupil in his acquisition, the power to awaken the mind to a love and mastery of knowledge, and the power to disclose the essential unity and composite scope of truth. The professional necessity sinks from the first to the last, the personal inspiration rises from the beginning to the end. The lower excellence can hardly be secured without some measure of the higher, and the higher ceases to be permanently fruitful without a large measure of the lower."

Add to these four qualities the power to guide the student in the search for truth, also a stimulus to create an abiding love for the search after truth, and you will have essentially what is necessary to conduct graduate work.

Inasmuch as I am making these statements to a body of professional men, permit me to point out what, to me at least, has always appeared to be a fundamental error in the attitude of men of so-called pure science toward those in applied science. Just as Bascom is mistaken in supposing that teachers of the pro-

fessions must lose out in the four "primary qualities" of good undergraduate instruction as you pass step by step from the power to impart information to the power to disclose the essential unity of truth, just so many teachers of graduate students frequently have the erroneous idea that men of pure science only are concerned with the advancement of truth, and that those of applied science are but parasites who utilize the new truths discovered by their colleagues and apply them to practical or even selfish ends.

There never have been, and never will be, any hard and fast lines between pure and applied science. The investigator of truth for its own sake knows well that from every grain of truth there will ultimately develop a veritable harvest of practical application. While he may be satisfied frequently, because he is aware of his limitations, with the mere discovery and statement of a new truth, he is constantly stimulated by this knowledge. The fact that the applied scientist, also because conscious of his limitations, is so often content with the mere application of knowledge discovered by others, is no reason why this practice should be laid down as a dogma that differentiates arbitrarily between the two types of investigators. As a matter of fact modern research, in both the pure and applied camps, is giving the lie more and more to such erroneous fundamental conceptions. If arrogance has erred so frequently in one camp, false pride has erred equally in the other.

So much for the men and the spirit that should govern them. Permit me to emphasize once more that the graduate faculty does not consist of professors alone, but of professors and students. The stimulus of the young searcher after truth is often regarded as being as essential to the teacher, as the guidance of the latter is to the former.

Finally, just a brief word as to equipment. The fallacy of the trite saying of the late President Garfield, a graduate of Williams and an admirer of its famous president, that an ideal college consisted of a Dr. Hopkins at one end of a log and of a student at the other, has been pointed out by another graduate of Williams who was unquestionably more competent to judge and who regarded such catchy snatches of rhetoric as adulation. The time when a Berzelius could be a mighty guide in research to one or two students at a time in his laboratory kitchen, the use of which he had to contend constantly with his cook, is largely a thing of the past; as is also the time when a Scheele could make discoveries in his little apothecary shop laboratory at Koeping, discoveries that surprised the world then and surprise it even more to-day as we appreciate fully the significance of the results accomplished by this worker of miracles; or even the time of the more pretentious facilities of a Sertuerner who discovered the basic properties of morphine, a discovery of which we celebrate the hundredth anniversary this year.

Modern research requires money, more money, and yet more money to provide the necessary facilities. If we but consider the millions spent for agricultural research in this country, if we think of the vast sums with which medical research at the twenty-six research institutes of this country is endowed, if we reflect that a modern "*Farbenfabrik*" will allow not one but many Ph.D.'s to work year in and year out for the discovery of a new remedy, pharmacists might well lose heart and give up the idea of ever accomplishing anything worth while. Though it be true that we may scarcely hope to see another Scheele arise in modern pharmacy,

or even another Sertuerner; yet, with the right spirit, pharmacists in this country need not lose all hope.

Having already related the experience of my matriculation at the University of Bonn, allow me in closing to refer to another experience of the last day spent in Goettingen. The statue of Friederich Woehler was being unveiled before one of the academic buildings; and the four faculties, students as well as professors, were assembled to do honor to the memory of the discoverer of the truth that the substances of animal and vegetable organisms can be produced without the intervention of the life process. It was the venerable Hofmann, the author of so many excellent biographies, who delivered the address. Thinking of the campus with its essentially undergraduate atmosphere, of the laboratory with meager equipment even for undergraduate work that was awaiting him, the American student, who had received so much stimulus from his teachers at two German universities, received the greatest stimulus on that last day when the venerable Berlin professor, in pointing to the difference that existed in the equipment of the new organic laboratory in which the American had been privileged to work for two semesters, and the meager facilities that had surrounded Woehler when he made his remarkable discoveries, said: "*Es kommt nicht auf den Kaefig an. Die Frage ist ob der Vogel der drinnen sitzt singen kann.*" It matters little whether the cage is of wood or gold, the important question is whether the bird in the cage can sing.

THE SCHOOL OF PHARMACY AND THE PROFESSION.*

BY C. FERDINAND NELSON.

It needs scarcely be emphasized that we are living in an age of extreme specialization. A thousand happenings, large and small, significant and trivial, force the conclusion home to us daily. On every side of us, in every walk and avenue of life, wheresoever we chance to turn this minute dissection of things is constantly evident. The division of the world's labor has become tremendously complex. Where but a few years ago one vocation existed ten may exist to-day. The practice of medicine is no longer a single profession, it is rather a dozen separate callings. The engineer is no longer master of his field, but picks out one small corner of it and here does his bit. One lawyer masters criminal statutes, another the law of corporations, a third constitutional or international law. This dentist pulls teeth, another fills them. Specialization rules the day and us. We are its servants whether we will or no, and wherever it leads us we must follow.

The advances in every line of endeavor that have come as a direct result of this concentration have been many and important. It will, however, not serve our purpose to discuss these here except to mention the tremendous impetus that has been given to organized training, to the importance of college and university work in the last decade. The business man, the professional man, the artisan, have all found out that they must be trained rapidly and systematically if they would compete successfully.

* Presented before the joint session of the Section on Education and Legislation, A. Ph. A., the American Conference of Pharmaceutical Faculties, and the National Association of Boards of Pharmacy, Indianapolis meeting, 1917.

And so of sheer necessity we find ourselves living in an age of extreme educational activity. The school has become universal. Orderly and efficient accumulation and dissemination of knowledge has become imperative. Every state has its large university; there are colleges in the land by the hundreds. Schools of medicine, law, pharmacy, engineering, dentistry, agriculture, forestry, mining, and finance are found in every state of the Union. We go to school to learn philanthropy and social science, how to nurse, how to drive an automobile, and how to play golf. Surely the classroom and laboratory are important factors in modern life.

In the professions, too, the college has become absolutely necessary. No one can become a doctor to-day who has not received a college training. A great many of our engineers and lawyers are college men. In pharmacy the state boards have awakened to the necessity of preliminary study in a school of pharmacy and before long we may well hope to see every young man or woman that enters a drug store equipped with the superior advantages which systematic training gives.

I have dwelt at some length on the point of the importance of the school in modern life because in pharmacy we have been slower to recognize this fact than in any of the other professions. Whether the cause for this lack is to be found in the fact that we have specialized less, and this is certainly true in a professional sense, is, of course, hard to determine. Certain it is that we have rebelled vigorously at each new required educational advance and there has been genuine fear in many quarters that if educational requirements kept on going forward apace, the drug market would soon be entirely depleted of men. We need more than ever to-day to reap the advantages of organized information, to encourage, support, and endow our existing schools so that they may be able to do more and more for the cause of Pharmacy and for the young men that are to enter the calling.

If the college is an important institution in the life of a profession, as we believe it is, we have a right to demand important things from it and on certain points at least we should expect leadership to come from this source. Many pharmacists have in the past wrongfully assumed that the college existed only to supply them with clerks. Were this the only function of a college of pharmacy, the profession would soon be in a sorry plight. On constructive matters, legal or professional, their advice has not been sought enough. This point the profession must sooner or later come to recognize and correct.

But what, we may ask, should the modern college of pharmacy do for the profession of pharmacy? We are all agreed that its first duty is to prepare men to practice retail pharmacy; a second function is to train men to fill positions as pharmaceutical chemists and to supply men for the wholesaling of drugs and chemicals; a third to do research work to advance our knowledge of the uses of drugs and medicines; a fourth to train teachers and investigators so that pharmacy may enlarge the scope of its activities. These are important functions and if done well would seem to be enough. And yet there is another exceedingly important phase of pharmaceutical activity to which we must give a great deal of attention in the immediate future, which the college must take upon itself to solve or at least do all in its power to help the conscientious lover of pharmacy to unravel. It is this problem to which I desire to invite your attention for a few moments.

The one conspicuous and outstanding fact in the retail practice of pharmacy to-day is the disproportion between the commercial and professional activity of the pharmacist. A great deal has been written decrying commercialism and urging us back to the prescription counter. Much has been said about the necessity for the pharmacist being the manufacturer of the drugs he dispenses, but we have entirely forgotten the question of the evolution, or thought of urging the enlargement of the scope and ideals of the profession. Pharmacy is to-day, as it was in its infancy, the science and art of preparing drugs and filling prescriptions. We must not wonder that we have floundered in a sea of commercialism with a barque so small and inadequate and outworn. The wonder is that we have survived at all. The introduction of machinery and the establishment of large manufacturing houses have forever taken from the retail pharmacist the hope of being a successful manufacturer of his own preparations. We must meet this fact squarely and recognize it. It is as useless for the retail pharmacist to compete with the manufacturer in this respect as it was years ago for the trade unions to protest against the introduction of machinery in the trades. The machine conquered, and so will wholesale manufacture of drugs. We should drop this as an ideal for retail pharmacy, but as we drop it put something in its place.

And what has happened to our prescription departments, of which we have been so proud, and upon which so much care has been lavished in the past? A few flourish, some exist, many are entirely wiped out. The average pharmacist to-day despairs of making a living on the strength of his prescription sales. And well he may if he expects only to fill the old style of prescriptions; *i. e.*, drugs, drugs for every ailment known to man. The medical profession has passed this point and we must expect the number of prescriptions written to decrease. But what have we put in its place, a professional void, to be occupied too soon by another side line? Is it not an indisputable fact that the two vital professional elements in our calling upon which in the past we have sought to stand have slipped, or are rapidly slipping, from our grasp? Is it not equally true that we have not sought to substitute anything for that which we were losing?

Pharmacy must revise its ideals and define anew and in broader terms its scope and purposes. The mortar and pestle are not adequate insignia for twentieth-century pharmacy. They serve modern life too poorly, touch it at too few angles, have become of secondary rather than primary importance. And the same holds only too true for the retailing of drugs and chemicals.

This point of view need not shock even the most conservative among us. We have but to look at our sister profession of medicine to find that time and time again it has emerged from out of the hard shell of its former practices and into a newer and better one, repeatedly has it re-defined its scope and broadened its usefulness. And yet it has not changed its name. The physician is no physicist and yet he has insisted upon mastering the technique of the X-ray machine. He claims to be no electrician and yet he will tell you much about the faradic current and the electrocardiogram. He is no engineer and yet he raises his voice on questions of sanitary problems. These things could by no possible stretch of the imagination have entered into a definition of the practice of medicine half a century ago.

May it not be that what we need more than anything else to infuse and rejuvenate the profession which we all think so much of, for to one who has been

behind the counter for years there is a real charm in pharmacy that only he knows, may it not be that what we need is to include in the definition of pharmacy something besides that which we have heretofore always included? Can we not fill the older now empty or nearly empty spaces with something besides commercial side lines? To find this out is a fifth duty of our schools of pharmacy. They should systematically study the problem and we should all help them solve it.

It can be shown with reasonable certainty that pharmacy and medicine are essentially complementary professions and that in the large their business is to solve the problems of health and disease. Anything included under these problems may, therefore, belong legitimately to pharmacy or medicine. Why we should only sell tablets and make tinctures and leave all the rest to medicine is not at all clear. The physician needs our aid along far more important lines and so does the public. Is there any logical reason, then, why we should continue as we do?

Medicine concerns itself chiefly with physical diagnosis and treatment of disease. Prophylaxis is also becoming more and more of its concern. I would like to define pharmacy as the science and art concerning itself with all of the remaining aspects of the two problems previously mentioned. This would give us professional responsibility which we need so badly, and yet not take us too far afield from pharmacy as we now know it. Particularly in things chemical are we fitted for this larger work. Our heritage is chemistry. Much that to-day is important in chemistry was brought to light in the old apothecary shop. We should undertake all of the chemical and even bacteriological work now included under medical laboratory diagnosis. Already we see the signs of the medical laboratory coming to do this work for each community. The pharmacist should anticipate this work because it really belongs to him to do. The municipal and sanitary laboratory as far as health problems are concerned should be in his hands. To the mortar and pestle should be added the test tube and Petri dish. With this combination we may reasonably hold our own—professionally do our bit and do it well. Without anything but prescriptions and patent medicines to sell to the public we cannot hope to survive. We shall drift ever farther into pure commercialism and with it will disappear every vestige of pharmacy as a distinct calling.

ARSENIC INSECTICIDE INDUSTRY PLACED UNDER THE LICENSE SYSTEM.

The Food Administration has issued the following:

With the idea of further conserving the Nation's food supply by protecting it from insect ravages, President Wilson, in a proclamation dated November 15, has placed the arsenic industry of the United States under direction of the Food Administration. The President's action comes in answer to a threatened shortage in the supply of arsenical insecticides, which are the farmer's chief protection for his crops against the onslaught of "biting insects."

All those engaged in the business of importing, storing or distributing insecticides containing arsenic are required to secure a license.

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Editor on the day following the meeting, if possible. Minutes should be *plainly* written, or typewritten, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

BALTIMORE.

The November meeting of the Baltimore Branch of the American Pharmaceutical Association was called to order by President McKinney in Harris Hall of the University of Maryland on Wednesday evening, November 21st.

The reading of the minutes of the preceding meeting was omitted.

President McKinney appointed Dr. John F. Hancock, Dr. H. P. Hynson, and Dr. E. F. Kelly as a committee to draft suitable resolutions upon the death of Dr. Charles Caspari, Jr. The following resolutions were later presented:

"*Resolved*, That this Branch has learned with deep regret of the death of Prof. Chas. Caspari, Jr.

"*Resolved*, That the Branch suspend the consideration of all other business in order to pay appropriate respect to the lamented deceased.

"*Resolved*, That the members of the Baltimore Branch of the American Pharmaceutical Association will hold in lasting remembrance the lamented Dr. Caspari, who was one of the organizers of the Branch and who continued to the time of his death a loyal and useful member.

"*Resolved*, That the Secretary be directed to transmit to the family of the deceased a copy of these resolutions and our deepest sympathy for their bereavement."

As there were several members present who were unable to attend the Caspari memorial services, request was made that they be allowed to pay tribute to him at the meeting of the Branch, and Mr. W. J. Lowry, Jr., President McKinney, Dr. H. Engelhardt, Mr. Louis Schulze, Dr. J. F. Hancock, and Dr. H. P. Hynson told how greatly their lives had been influenced by Dr. Caspari and how much they respected him and honored his memory.

Dr. J. F. Hancock then read a communication from E. G. Eberle reporting the death of President Charles Holzhauer.

Reports of the meeting of the American Pharmaceutical Association at Indianapolis were made by Dr. H. Engelhardt and Dr. E. F. Kelly. Dr. Engelhardt stated that he attended all of the meetings of the Council with the exception of one and was well pleased with the work accomplished calling especial attention to the committee appointed for research work, this work to be financed by the money accruing from the sales of the National Formulary. Dr. Engelhardt also stated that he attended all of the meetings of the Scientific Section, and enjoyed the papers presented.

Dr. Kelly's report of the Indianapolis meeting was more general. He expressed pleasure in the great interest shown by all present in the meetings of the different Sections and regretted that it was a physical impossibility for one to attend all of the meetings of all of them. He called especial attention to President Wulling's address, which dealt in a large measure with the federation of pharmaceutical organizations; to the report of the great strides made in the successful cultivation of crude drugs; to the masterly presentation by J. C. Peacock of Philadelphia and Orel Jones of Nebraska of the idea that the druggist should capitalize his responsibility; of how the House of Delegates, if properly conducted, could be made the clearing house of the Association, and that no matters other than those involving finances would then have to be brought before the Council; and to the interest elicited in the Conference of Faculties by the proposed requirement of four years' high school training, beginning with the year 1923.

Dr. Daniel Base then spoke of the great interest the students of the Department of Pharmacy of the University of Maryland had taken in the Edmonds Bill. Quite a discussion followed and the Branch went on

record as endorsing the Edmonds Bill, the Secretary being instructed to send communications to the Maryland Senators and Congressmen advising them of the action taken by the Branch.

This being the first meeting since May, several members expressed their pleasure in the large attendance and interest manifested, and promised to assist the Chairman of the Executive Committee in making future meetings equally interesting and instructive.

B. OLIVE COLE, *Secretary-Treasurer*.

DETROIT.

The members of the Detroit Branch of the American Pharmaceutical Association had the privilege of hearing two very competent men at the regular meeting, Dec. 14th.

M. O. Williams, secretary of the Michigan Drug Co., gave a talk on "The Growing, Gathering, Marketing and Retail Selling of Sponges." With samples of the different grades and species of sponges, pictures of the warehouses and markets, and a first-hand knowledge of the methods of gathering, the audience was given an insight into the sponge industry which is seldom accorded any one, except buyers.

Since practically every human being is indebted to the rubber industry from the entrance into this world to the exit and all through life, all modern inventions from the telephone to the submarine having been made possible through the same medium, the topic of "The Manufacture and Selling of Rubber Goods" was of keen interest to all present. W. S. Davison, sales manager of the Drug-Sundry Department of the Miller Rubber Company, Akron, Ohio, gave a graphic description of the manufacture of rubber goods, from the crude product to the surgeon's glove, and from his observations as a salesman he showed the necessity for the druggist to merchandise and not merely storekeep.

MAY STRAWN, *Secretary*.

NASHVILLE.

A joint meeting of the Nashville Branch of the American Pharmaceutical Association and the Nashville Drug Club was held December 13, with D. J. Kuhn presiding.

After the approval of the minutes of the previous meeting, a letter was read from Mr. Harry Hogshead, of Staunton, Va., in which he stated that his community was also having

trouble in the enforcement of the prohibition laws. In an article he enclosed, entitled "Remove the Tempter," he advocated the removal of the alcohol content from the label as a means of lessening the sale of Essence of Ginger and flavoring extracts for beverage purposes.

As a result of the action taken at the last meeting, the wholesalers have volunteered to limit their sales of Essence of Ginger; the calls have also greatly decreased.

Quite a number of letters have been received recently from manufacturers endorsing the Butterick "Buy-at-Home" plan, as a result of the letters sent out by the Drug Club.

Attention was called to the increased difficulties in delivering goods due to the enforcement of the Child Labor laws. Extra charges, the cutting out of small deliveries and an appeal to the public through the press to carry home goods when possible, were some of the suggestions made to relieve the situation.

S. C. Davis, Ira B. Clark and M. E. Hutton were named as a committee to confer with the Mayor and the Sheriff in regard to the arrest of some druggists for selling cigarettes. Although there was a law prohibiting the sale of them, the last legislature licensed their sale and many paid the tax, supposing they had a right to sell them. Now their money is tied up in stock with no chance to dispose of it.

WILLIAM R. WHITE, *Secretary*.

NEW YORK.

The December 1917 meeting of the New York Branch of the American Pharmaceutical Association was called to order by President Mayer in the Library of the New York College of Pharmacy on Monday evening, the 12th, at 8:30 o'clock.

The minutes of the preceding meeting were read by the Secretary and adopted as correct.

The Treasurer submitted his report which showed a balance of \$223.00 on hand. This was ordered filed.

Membership Committee.—Mr. Nitardy's application to local branch was received and passed.

Committee on Fraternal Relations.—Dr. Diner stated that there was considerable difficulty in establishing fraternal relations and that because of lack of support he would refuse to accept another nomination to his office. This report was received with regret.

Progress of Pharmacy.—Dr. Diekman because of a cold was unable to be present.

Committee on By-Laws.—Dr. Diner reported progress and promised to have a report at our next meeting.

President Mayer appointed the following members to serve on the nominating committee: Henry V. Army, Hugo Kantrowitz, Thomas Latham.

A motion was made by the Secretary, seconded and carried that the members of our branch who entered the services of our country be allowed to continue their membership in the Branch without payment of dues until the expiration of the present war.

It was moved, seconded and carried that a page in our minutes be set aside in commemoration of Mr. Charles Holzhauer, and that the regular January meeting be devoted as a memorial meeting.

President Mayer appointed Prof. Jeannot Hostmann, Chairman, Edward A. Sayre and John C. Gallagher to serve on a committee to draw up suitable resolutions in commemoration of Mr. Holzhauer's death.

New Business.—Dr. C. P. Wimmer read a very interesting paper on "Emergency Substitutes for Sugar, Syrup, and Glycerine." The paper together with the samples shown aroused a spirited discussion. A vote of thanks was extended to Dr. Wimmer, and the meeting then adjourned.

HUGO H. SCHAEFER, *Secretary*.

PHILADELPHIA.

The December meeting of the Philadelphia Branch of the American Pharmaceutical Association was held Tuesday evening, December 4th, with the President, Ambrose Hunsberger, in the chair. Routine business dispensed with, the speaker of the evening was presented to the meeting in the person of Dr. Robert Kraus, chemist to the Phipps Institute of the University of Pennsylvania. The subject under consideration was "The Preparation of Dichloramin-T. and Chlorinated Eucalyptol 1.2."

The author went into detail concerning the preparation of the much-heralded antiseptic, dichloramin-T., and outlined a new and original method for its production, starting with toluol, and designed to furnish a perfectly stable product. The difficulty with a former method was that it did not completely purify the substance and caused, on standing, a gradual breaking down of the chemical with a consequent loss of chlorine. Dr. Kraus' paper is printed in this issue of the JOURNAL.

The preparation of the solvent, chlorinated eucalyptol, was also discussed by the speaker, who stated that it was best prepared by passing chlorine gas into eucalyptol (sp. gr. 0.922). The original Dakin technique, using potassium chlorate and hydrochloric acid for generating chlorine and chlorinating the eucalyptol was held to be unsatisfactory since the final product was not uniform in its chlorine content. Dr. Kraus brought his paper to a close by referring to the various concentrations of the dichloramin-T. in the chlorinated eucalyptol and stated that, while the range covered from a 5 to a 20 percent solution, the usual strength utilized by the surgeons was a 7.5 percent solution. By means of a test, using starch iodide as a reagent, Dr. Kraus demonstrated the absence of free chlorine in the preparation made according to the revised method, and the presence of the undesirable free chlorine in a product prepared according to the older method. Samples were shown demonstrating the various steps in the production of the dichloramin-T. and also beautiful crystals of the finished product. After referring to the excellence of the paper, the Chairman asked for a discussion of the paper.

Elmer H. Hessler stated that he had been endeavoring for some time to turn out a satisfactory dichloramin-T. and enumerated the difficulties which he had encountered along the way. Dr. Estelle Lee then in a very efficient manner, after deploring the unfortunate notoriety which this new antiseptic had attained through newspaper publicity, gave some of the experiences which he and his colleagues had gained in studying the proposition of and search for the "efficient antiseptic." He stated that the efficacy of the volatile oils as antiseptic agents had long been known and surprised the listeners by stating that eucalyptol had a phenol coefficient of 0.35 while the chlorinated eucalyptol had (comparatively speaking) the phenol coefficient of zero. This was only true, however, when tested "in glass." Dr. Lee further stated that the fact had been established, at the front, that all wounds if given proper surgical treatment within six hours after their infliction, would heal without recourse to any antiseptic at all. The search for an economical antiseptic and an efficient one, of course, was inaugurated however, to give surgeons a means of treating the wounds of those who were unable to receive immediate treatment. So far this new, dichloramin-T. was the very

best antiseptic found, and considering the fact that about fifty such "very best" antiseptics have been utilized and afterwards discarded since the commencement of hostilities, Dr. Lee granted that this was rather an assertive statement to make. Answering a question propounded by Prof. Gershenfeld, Dr. Lee claimed that the reason for the continuous success of the dichloramin-T. in chlorinated eucalyptol was not alone due to the fact that it was much more economical to use than the older Carrel-Dakin solution, but also to the fact that it did what it was supposed to do when properly prepared and properly used. John K. Thum requested information concerning the germicidal power of the solution of dichloramin-T. in chlorinated eucalyptol after precipitation had commenced. Dr. Lee, answering, stated that after the precipitation commenced the product should be discarded since precipitation was an evidence of the fact that decomposition with a consequent liberation of chlorine was occurring and that such a product became extremely irritating and, therefore, injurious when applied to denuded tissues.

Professor C. H. LaWall then referred to the formulas which the speaker has supplied and pertinently demonstrated that the formula outlined for a 20 percent solution actually made only a 16 percent solution. Both Dr. Kraus and Dr. Lee coincided, however, in stating that the error, now quite apparent, had simply been handed down to them from other sources, and that for the sake of uniformity the formulas should and would be changed. Others participating in the discussion were Dr. Fischelis, Professor Gershenfeld, Messrs. Eberle, Thum, and Hessler. Some other points brought out in the discussions are as

follows: First, that dichloramin-T. can be purified by dissolving it in a weak solution of caustic soda and passing chlorine into the solution until the crystals are precipitated out. The crystals are then thoroughly dried by proper means. Second, that the amorphous form of this chemical is more stable than the crystalline form. Third, that the various strength solutions of the dichloramin-T. should be made up in small quantities and not kept on hand over seven days. Amber glassware should be the only containers. Fourth, that the solution should be made up in absolutely dry bottles, free also from alcohol or ether. Fifth, that eucalyptol is unobtainable in England at the present time, and that a search is being made for a similar product that will serve equally well as a chlorine carrier. Sixth, that the solution of dichloramin-T. in chlorinated eucalyptol has been used in several instances as a nasal spray with dire results to the user, due to its irritating the sensitive mucous membrane. It has been recommended for this purpose, well diluted with paraffin oil. Seventh, that, after all, in the prevention of infection, the chemical agent plays a very unimportant part and that proper surgical technique is the main secret of success in promoting quick healing. As Dr. Lee expressed it, surgical efficiency contributed 90 percent of the success of the treatment and the efficient antiseptic the rest.

On motion of E. G. Eberle, seconded by Prof. C. H. LaWall, the thanks of the Branch were heartily extended to both Dr. Kraus and Dr. Lee. The meeting was one of the most successful in the history of the Local Branch, and was attended by 75 persons.

IVOR GRIFFITH, *Secretary*.

LICENSE TO MAKE SALVARSAN.

Announcement has been made in Washington that three licenses had been granted by the Federal Trade Commission for the manufacture of Salvarsan (December 1). Two of the licenses are in New York and one in Philadelphia. The latter has been granted to the Dermatological Research Laboratories; the laboratories are located in the Polyclinic Hospital, and Dr. Jay F. Schamberg is director. The New York Manufacturers are Herman A. Metz Laboratories and Takamine Laboratories.

COUNCIL BUSINESS

A. PH. A. COUNCIL LETTER NO. 1.

PHILADELPHIA, PA., September 26, 1917.

To the Members of the Council:

GENTLEMEN:

The following is a list of the members of the Council for 1917-18:

Members of the Council, 1917-18.

Apple, Franklin M., 3233 W. Berks St., Philadelphia, Pa.
Arny, H. V., 115 W. 68th St., New York, N. Y.
Beal, James H., 801 W. Nevada St., Urbana, Ill.
Beringer George M., 5th Federal Sts., Camden, N. J.
Bradley, Theo. J., Mass. College of Pharmacy, Boston, Mass.
Day, Wm. B., 701 So. Wood Street, Chicago, Ill.
Diner, Jacob, 316 W. 84th St., New York, N. Y.
Dohme, Alfred R. L., Pratt & Howard Sts., Baltimore, Md.
Dewoody, Wm. Lawrence, 516 W. 4th St., Pine Bluff, Ark.
Dye, Clair A., Ohio State Univ., Columbus, Ohio.
Eberle, Eugene G., 253 Bourse Building, Phila., Pa.
Eldred, Frank R., 3325 Kenwood Ave., Indianapolis, Ind.
Engelhardt, Hermann, 2912 Garrison Ave., Baltimore, Md.
England, Joseph W., 415 N. 33rd St., Philadelphia, Pa.
Fennel, C. T. P., 614 W. Court St., Cincinnati, Ohio.
Fischelis, Robert P., 828 North 5th St., Philadelphia, Pa.
Fuller, H. C., 19th & B Sts., N. W., Washington, D. C.
Goddling, John G., 278 Dartmouth St., Boston, Mass.
Hall, W. A., 200 Griswold St., Detroit, Mich.
Hensel, Samuel T., 351 Mercantile Bldg., Denver, Colo.
Hilton, Samuel L., 1033 22nd St., N. W., Washington, D. C.
*Holzhauer, Charles, 732 Heigh St., Newark, N. J.
Hopp, Lewis C., 1104 Euclid Ave., Cleveland, Ohio.
Hostmann, Jeannot, 115 W. 68th St., New York, N. Y.
Jordan, C. B., 409 Russell St., Lafayette, Ind.
Koch, J. A., Bluff & Pride Sts., Pittsburgh, Pa.
LaPierre, E. H., 80 River St., Cambridge, Mass.
Mason, Harry B., P. O. Box 484, Detroit, Mich.
Mayo, Caswell A., 66 West Broadway, New York, N. Y.
Peacock, J. C., Erie & Broad Sts., Philadelphia, Pa.
Roehr, Clarissa M., University Hospital, San Francisco, Cal.
Sayre, L. E., Univ. of Kansas, Lawrence, Kansas.
Seltzer, L. A., 32 Adams St., W. Detroit, Mich.
Snow, Clyde M., 701 S. Wood St., Chicago, Ill.
Stewart, Francis E., 11 W. Phil-Ellena St., Phila., Pa.
Stockberger, W. W., Bureau of Plant Industry, Washington, D. C.
Whelpley, Henry M., 2342 Albion Place, St. Louis, Mo.
White, William R., 311 Grace St., Nashville, Tenn.
Wilkerson, J. A., 2036 Russell St., St. Louis, Mo.
Walling, F. J., University of Minnesota, Minneapolis, Minn.

Total number, 40.

The following committees of the Council have been elected for 1917-18:

* Deceased November 19, 1917.

COMMITTEES OF THE COUNCIL.

Committee on Finance and Auditing Committee.

J. A. Koch, Chairman, Pittsburgh, Pa. Otto F. Claus, St. Louis, Mo.
E. H. LaPierre, Cambridge, Mass.

Committee on Publication.

J. W. England, Chairman, Philadelphia, Pa. C. A. Mayo, New York, N. Y.
George M. Beringer, Camden, N. J. H. B. Mason, Detroit, Mich.
E. L. Newcomb, Minneapolis, Minn.

Ex-Officio Members—The Editor, Reporter on the Progress of Pharmacy, General Secretary and Treasurer.

Committee on Invested and Trust Funds.

Wm. B. Day, Chairman, Chicago, Ill. Frederick J. Wulling, Minneapolis, Minn.
E. G. Eberle, Philadelphia, Pa. H. M. Whelpley, *ex-officio*, St. Louis, Mo.

Committee on Centennial Fund.

Charles Holzhauer, Chairman, Newark, N. J. Wm. B. Day, Chicago, Ill.
J. A. Koch, Pittsburgh, Pa.

Committee on Transportation.

Caswell A. Mayo, Chairman, New York, N. Y. Fred I. Lackenbach, San Francisco, Cal.
Wm. B. Day, Chicago, Ill. E. Floyd Allen, Minneapolis, Minn.
Lewis C. Hopp, Cleveland, Ohio. F. C. Godbold, New Orleans, La.
H. M. Whelpley, St. Louis, Mo. W. S. Elkins, Jr., Atlanta, Ga.
Charles G. Merrell, Cincinnati, Ohio. C. Herbert Packard, E. Boston, Mass.
Charles Caspari, Jr.,¹ Baltimore, Md. F. W. Nitardy, Denver, Colo.

The General Secretary and Local Secretary, *ex-officio*, members.

¹ Deceased October 13, 1917.

Committee on National Formulary.

W. L. Seoville, Vice-Chairman, Detroit, Mich. E. Fullerton Cook, Phila., Pa.
Clyde M. Snow, Chicago, Ill. H. A. B. Dunning, Baltimore, Md.
A. B. Stevens, Ann Arbor, Mich. Samuel L. Hilton, Washington, D. C.
Otto Raubenheimer, Brooklyn, N. Y. Charles H. LaWall, Phila., Pa.
Leonard A. Seltzer, Detroit, Mich. Geo. M. Beringer, Camden, N. J.
Harry V. Army, New York, N. Y. Wm. A. Hall, Detroit, Mich.

Adam Wirth, New Orleans, La.

Committee on Standards.

Please report errors of names or addresses.

Motion No. 1 (Appropriation of \$100 for expenses of Committee on Membership). Moved by W. B. Day, seconded by J. A. Koch, that \$100 be appropriated for the expenses of Committee on Membership. The appropriation is approved by the Committee on Finance.

Chairman Day of Committee on Membership writes:

"I find it necessary to add to the appropriation for membership work. Our budget item for the Committee on Membership is \$250.00. We have paid out to the New York Branch \$176.00 for commissions; two other branches \$14.00, leaving only \$60.00 for the ordinary work of the Committee. We have an overdraft in the account of \$8.95."

At the final general session at Indianapolis, the report of the American Joint Committee on Horticultural Nomenclature was presented and it carried a recommendation that \$25.00 be appropriated toward the expense of the work conducted by this joint committee. This request for an appropriation was approved by the general session.

Motion No. 2 (Appropriation of \$25.00 for expenses of American Joint Committee on Horticultural Nomenclature). Moved by W. B. Day, seconded by J. A. Koch, that the sum of \$25 be appropriated towards the expenses of the American Joint Committee on Horticultural Nomenclature. The appropriation is approved by the Committee on Finance.

Motion No. 3 (Membership Dues in American Metric Association). Moved by W. B. Day, seconded by J. A. Koch, that \$10.00 be appropriated for an organization-membership for the American Pharmaceutical Association in the American Metric Association. This is in conformity with the recommendation of the report of the Committee on Weights and Measures which was approved by the Association at the final general session.

Motion No. 4 (Additional Appropriation of \$400 for Year Book, 1915, Vol. 4). Moved by W. B. Day, seconded by J. A. Koch, that an additional appropriation of \$400 for the Year Book, 1915, Vol. 4, be made. The appropriation is approved by the Committee on Finance.

General Secretary Day writes:

"I wish to explain that our appropriation for the Year Book, Volume III, was but \$2500.00 (see Budget for 1916). The cost of the Year Book, Volume III, was approximately \$2900.00, leaving a deficit of \$400.00 which was taken care of at the time from \$3000.00 appropriated in the 1917 budget for Volume IV. We are now that amount short in our appropriation for the current volume and the additional appropriation, as above moved, clears up this deficit.

¹ Deceased October 13, 1917.

"The approximate cost of the Year Book, Volume III, was \$2901.62. The approximate cost of the Year Book, Volume IV, was \$2919.77. The appropriations for these two volumes were \$2500.00 and \$3000.00, respectively. There may be still a few small items, such as postage or express, chargeable against the 1917 Year Book account which this additional appropriation will fully meet."

General Secretary Day writes as follows:

"The Committee on Research of the Scientific Section offered the following resolution which was adopted by the Section and approved by the third general session. You will note that it entails the appointment of a committee by the Council. The resolution is as follows:

"That the Section recommend to the Council that a Committee on Research be added to the standing committees of the Association. That this Committee consist of ten members—two to serve five years; two four years; two three years; two two years; and two one year; and that each year thereafter two members be appointed to serve five years and that this Committee be appointed by the Council and reports be presented before the Scientific Section."

"Upon motion of Dr. Whelpley, the general session adopted the above recommendation with the request that this committee formulate rules and regulations for proposed research and report at the next meeting of the Association.

"The Committee of the Scientific Section which made this recommendation consisted of C. H. LaWall, Chairman, C. E. Vanderkleed, Wm. Mansfield, A. Viehoever, W. L. Scoville."

It has been suggested that the members of the Committee of the Scientific Section who made the recommendation be appointed as five of the ten members of the Committee. What is the wish of the Council?

415 N. 33RD STREET.

J. W. ENGLAND,
Secretary.

A. PH. A. LETTER NO. 2.

PHILADELPHIA, PA., October 16, 1917.

To the Members of the Council:

GENTLEMEN:

Word has been received of the demise of Charles Caspari, Jr., one of the foremost figures of American Pharmacy and for many years actively identified with the American Pharmaceutical Association, both as a member and officially as Permanent Secretary (1894-96), and later as General Secretary (1896-1911). He died at his home in Baltimore on Saturday, October 13, 1917, aged 67 years. Owing to heart disease he had been in poor health for several months.

Edward Kremers, Madison, Wis., addressed the Council as follows:

"Rumor has it that in an army camp the dispensary is in charge of a medical student and that he is assisted by two drug store apprentices who have enlisted. Possibly similar conditions exist elsewhere. Whether reported correctly or not, it seems to me that the A. Ph. A. owes it to our calling to ascertain just what is the pharmaceutical situation in our camps and cantonments. While I am personally interested and have asked former students to inform me, it seems to me that such an investigation as proposed should not be left to individuals, but should be regarded as an imperative duty on the part of our Association. Trusting that my suggestion may receive your favorable consideration, I remain."

W. W. Stockberger, Washington, D. C., writes as follows:

"I have only recently received Council Letter No. 1, but I wish particularly to comment upon the proposition of Professor Day's letter with respect to the appointment of a Committee on Research.

"In the meetings of the Council at Indianapolis great emphasis was laid upon Research as a very important factor in the future growth and development of the profession of pharmacy. This being the case, the appointment of a Committee on Research becomes a matter for most serious consideration, and the heavy responsibility which has devolved upon the Council should be fully realized before any action is taken. Personally, I am inclined to characterize as hasty the suggestion that the members of the Committee of the Scientific Section who made the recommendation be appointed as five of the members of the Committee.

"The Committee on Research, I believe, will be charged with the grave responsibility of organizing and stimulating research among the various bodies pharmaceutic, with the view to raising scientific investigation within the American Pharmaceutical Association to the level which has already been reached by the American Medical Association, The American Chemical Society and other organizations that have long since recognized the necessity for organization and intensive application in the field of research. The Research Committee should include the very best men of our Association—men who not only have the ability to conduct or direct research but also the proved willingness to take an active part in the work of the Committee, the necessary time at their disposal, and the professional connection through which wide influence can be exerted. It must be admitted that either through personal disinclination or because of circumstances beyond their control, some very brilliant men are unfitted to serve on important committees, and in my opinion no man should be placed on our Committee on Research until his fitness to serve thereon has been determined beyond question.

"In selecting this Committee would it not be well to choose men from various lines of activity which though divergent in their main objects yet find a common interest in pharmaceutical research. Certainly a higher degree of coördination would be attached if the members of the Committee could be selected to represent each of the following: Colleges and Universities, Research or Experiment Stations, Departments of the U. S. Government, City Hospitals, Chemical and Pharmaceutical Manufacturers. Some such distribution of the members of the Committee is, I believe, an essential step toward arousing that general interest in the work of the Committee which is so necessary to the realization of the aims for which its appointment was authorized.

"My disapproval of the suggestion to appoint the members of the Committee of the Scientific Section as five or ten members of the Research Committee is based on the method of their selection, without regard to the personnel of the Committee itself. The election of this Committee by the Scientific Section resulted automatically following the adoption of one of the recommendations made by the chairman of the Section in the opening address at the Atlantic City meeting. This election occurred at the close of the last session of the Scientific Section, when only a small part of the membership of the Section was present. As there was no time for the deliberation and conference which should precede the appointment of an important committee, nominations were made from the floor of members present at the meeting and their immediate election resulted.

"The Council is now about to appoint, for a term of several years, members of an important committee, which will in a large measure determine the outcome of one of the most far-reaching movements ever inaugurated in our Association, and it is certainly incumbent upon us to exercise the greatest possible degree of wisdom and judgment in their selection."

Lucius E. Sayre, Lawrence, Kansas, writes:

"I have your letter of September 26th (No. 1). Reference is made to a communication from Secretary Day in regard to carrying on research, the recommendation coming through the Scientific Section of the organization.

"Permit me to state, as a member of the Council, that I hope in adding another standing committee to the many present existing ones, that the funds of the treasury need not necessarily be drawn upon to keep its work and functions alive and active. In formulating rules and regulations for proposed research there should be nothing attempted involving expenditure of treasury funds except so far as the funds are reserved or contributed for this specific purpose.

"It is stated in this communication that this Committee has been requested to formulate rules and regulations for proposed research. This seems to me to need some explanation. I should have preferred the paragraph to read that the Committee be requested to formulate plans for the stimulation of research rather than for *regulating* and *ruling* research. Research should be spontaneous, to be effective. It cannot be standardized. Stimulation should not take the place of subsidy so far as the American Pharmaceutical Association is concerned at the present time. The personnel of the Committee should be as broad as possible and to this end nominations and ballots should be resorted to in electing the members. This point seems to me to be vital to the success of the proposed Committee."

J. W. ENGLAND,
Secretary.

PHILADELPHIA, PA., October 29, 1917.

To the Members of the Council:

GENTLEMEN:

Motion No. 1 (Appropriation of \$100 for expenses of Committee on Membership. Motion No. 2 (Appropriation of \$25.00 for expenses of American Joint Committee on Horticultural Nomenclature). Motion No. 3 (Membership Dues in American Metric Association), and Motion No. 4 (Additional Appropriation of \$400 for Year Book, 1915, Vol. 4) have each received a majority of affirmative votes.

General Secretary Day writes:

"In our 1917 budget, we made no provision for buttons and pins. Dr. Whelpley has presented a bill for \$71.25 for buttons and pins and I have secured the approval of the chairman of the Finance Committee and his second to a motion appropriating \$75.00 for this purpose.

"Will you therefore please submit in your first Council Letter the following motion: Moved by W. B. Day and seconded by J. A. Koch that an appropriation of \$75.00 be made for the purchase of buttons and pins?"

This will be known as *Motion No. 5 (Appropriation of \$75 for A. Ph. A. Buttons and Pins).*

Jeannot Hostmann writes:

"In re the Committee on Research, I would like to state that I believe Mr. Stockberger's remarks are quite pertinent. The members of this Committee will have it in their power to inaugurate a plan that will do more toward the proper recognition of professional pharmacy and pharmacists than anything that has ever been proposed. I feel, therefore, that it is incumbent upon the members of the Council that they only make said appointments after careful and deliberate consideration.

"In connection with Mr. Stockberger's remarks concerning the distribution of committee memberships among the 'Colleges, Research and Experiment Stations, Departments of the United States Government, Hospitals, Chemical and Pharmaceutical Manufacturers,' I might, at this time, call the attention of the members of the Council to the extensive research work that has been inaugurated by the American Drug Manufacturers' Association. Perhaps it would not be out of place to keep this in mind when the time for selection arrives.

"After all is said and done, however, would it really be necessary to have these various allied branches represented by membership in the Committee? All of the aforementioned bodies are already well equipped financially to pursue the proper kind of research work, and if there was appointed a committee consisting of members of the A. Ph. A. possessing the proper qualifications to direct research and the real enthusiasm to encourage it, there would certainly be no lack of coöperation with other interested organizations.

"Would it not perhaps be better if the Committee concentrated its efforts toward stimulating research among the real simon-pure professional American pharmacists? I may be mistaken, but I believe that this is what the proposers of the Research Fund had in view and I believe that there are enough members of our Association connected with professional retail pharmacy to choose from when making selections for members of the Committee."

Charles T. P. Femmel writes:

"In reference to Prof. Kremer's remarks (in Council Letter No. 2) as to the status of American pharmacists in the realm of the defense programme I will say that my intelligence not alone as an American born but as a pharmacist has been repeatedly insulted by general comment as to the pharmacist's educational qualification. In my paper at the Indianapolis meeting I attempted to bring out some of the reasons why pharmacy fails of recognition. There are many phases to the question and easy of remedy, but because we admit our shortcoming does not necessarily imply ignorance or incompetency. In the preface of a medical text-book of recent date we are informed that the valued services of the pharmacist of former days are no longer required, in fact that he is a secondary consideration in the present age. With the propaganda against pharmacy not alone by other branches of science but by pharmacists themselves, professional pharmacy will be a science of the past—the fact cannot be presented to the pharmacists of the country too strongly and it is about time that they arise in a body to defend their rights. As I have often said, every pharmacist should be a member of the American Pharmaceutical Asso-

ciation, if for no other reason than loyalty to their chosen profession. Such a wave of unselfish devotion would sweep aside every obstacle and create a true American Pharmacy. In reference to the Research matter; I have felt that silence was golden, but since the matter is open for discussion I will say that the medical profession finds fault with the pharmaceutical profession for its lack of research pharmaceutical—I doubt very much whether the American Pharmaceutical Association could father a project so vast and coupled with tremendous expense. Resolutions and delegating the same to a committee is only the beginning and not the end desired. The question is of vital import and should receive serious consideration."

Jacob Diner writes:

"In re Committee on Research I wish to indorse all that Mr. Stockberger has said. The matter of the personnel of the Committee was brought up at the meeting in Indianapolis, Scientific Section, and I remember distinctly that no definite disposition of the manner of appointing the Committee was made. The general view obtained that the Committee was to be appointed by the usual channels, Council and President of the A. Ph. A., and there seems to be no reason why the accidental connection of certain names with the motion should presuppose their appointment on such a committee."

George M. Beringer writes:

"Council Letter No. 2 raises several pertinent questions. I quite agree with Professor Kremers as to the necessity for a thorough investigation of the conditions under which medicines are dispensed in the Army and the pharmaceutical situation in the army camps and cautions. Doubtless the Committee on Status of Pharmacists in the Government Service will look upon this as properly part of their duty.

"Dr. Stockberger's comments on the proposed appointment of a Committee on Research partly clarify the situation. However, I feel that this matter is not yet clearly before some of the members of the Council, and, as it should become a matter of historical record, I venture a few comments on this subject.

"In the report of the Committee on Financial Control of the N. F., there was a recommendation that a percentage of the proceeds from the publication of the N. F. should be set aside toward establishing an American Pharmaceutical Research Fund. After considerable discussion, the Council agreed that there should be set aside fifty percent of the apparent profits from the publication of the N. F., toward the establishing of a Research Fund of the American Pharmaceutical Association. When the matter came up for discussion in the final general session, as a matter presented in the minutes of the Council, many of the members present appeared not to have been acquainted with the discussion that had taken place in the Council room, and did not appear to be able to differentiate between the recommendation from the Council that a committee on administration and control of the work of the research fund should be appointed, and the recommendation which came in the form of a resolution from the Scientific Section that a Committee on Research should be appointed or rather continued, as such a committee had already been provided for at the preceding annual meeting held at Atlantic City.

"The Committee as finally agreed upon, I believe, was not definitely instructed as to its duties. I quite agree with Dr. Stockberger that the full intent of the several recommendations submitted to the Association will not be fully attained by simply continuing the Committee on Research of the Scientific Section. A wiser plan would be to permit either the President or the Council to give this matter proper consideration and select a committee that will have in mind all of the suggestions that have been made towards effective work on behalf of pharmaceutical research."

W. L. Dewoody writes:

"It is much to be deplored, if our cantonments and army camps are supplied with low-grade, inefficient pharmacists. We know too well that the safety and health of our soldiers depend as much or more upon the competence of the dispenser as upon the physician. Besides, the reputation of pharmacy as a profession is largely effected by the status of the camp dispensers. I do not know the rating of the pharmacists at Camp Pike, Little Rock, but it might be possible for me to find out through my friend, Mr. W. C. Bond, son of our old friend, Dr. J. B. Bond.

"Now as to the Committee on Research Work, I believe the best course to pursue is to appoint a chairman of known ability, enthusiasm, and one thoroughly interested in research work, and allow him to submit the names for the Committee to be voted on, added to, and selected later. One such man could select a committee with more wisdom than the whole Association."

Caswell A. Mayo writes:

"As regards the Committee on Research, my view of the matter is this: The idea conveyed to my mind by the discussion and the action taken was that the Council was to appoint a committee on plan and scope for the work of the Committee on Scientific Research. This committee to be appointed now was not to be the Committee on Scientific Research in its final form, but was to be a committee on plan and scope. In the selection of this committee on plan and scope the greatest care should be exercised, of course, to include men representing each branch of the sciences included in pharmacy as well as men of constructive ability and with sufficient vision to be able to divine the future possibilities of the Committee on Research.

"It seems to me, therefore, that the Council should appoint a committee on plan and scope for the Committee on Research; that this committee should be instructed to devise a plan and scope and report to the Council for action within the next few months. This plan would be then distributed, not only to the Council members, but to others whose opinions might be entitled to weight. In fact, it might be well to have it circulated among all the members of the Association for general discussion, so that the committee could revise the plan in accordance with the criticisms received and submit a definite plan to the Council for final adoption prior to the next meeting, so that when the meeting takes place every detail of the plan would have been worked out, and it then would be the province of the Association at large to select the members of the Research Committee."

J. W. England writes:

"There seems to be some confusion as to the action taken at the Indianapolis meeting relative to the establishment of the Committee on Research and the following abstracts from the minutes may clarify the situation:

"The Resolution of the Scientific Section presented to the Council reads as follows:

"The Scientific Section recommends to the Council that a Committee on Research be added to the standing committees of the Association, that this Committee consist of ten members; two to serve five years, two to serve four years, two to serve three years, two to serve two years, and two to serve one year, and that each year thereafter two members be appointed to serve five years; that this Committee be appointed by the Council and reports be presented before the Scientific Section."

"The subject came before the Association (in the Council minutes) at the final general session on Saturday, September 1, 1917. An extended discussion ensued and a number of motions were made. The status of the several motions being in doubt, President Wulling, in order to clear the situation, asked that the motions before the house be withdrawn. There being no objection, he declared that there was no motion before the house, to which no exception was taken.

"Dr. H. M. Whelpley then moved that the Association adopt the recommendation of the Scientific Section and instruct the standing committee to report rules and regulations at the next annual meeting, which motion was carried.

"From this it is clear that the Association directed the establishment of a Committee on Research as a *standing* committee of the Association, and requested it to report rules and regulations at the next annual meeting. Furthermore, such a committee of the Association, if existent, would obviously take the place of the Committee of the Scientific Section elected by the Section at the Atlantic City meeting (JOUR. A. PH. A., 1916, 1046, 1052).

"But, the question arises, 'Can the Association or the Council establish a *standing* committee of the Association by resolution?' And the answer is, of course, in the negative. The by-laws of the Association on 'Committees' (Chapter X), especially Article 1 (Year Book 1915, XXXIV), which specifically names the different standing committees, must be amended. And so far as the writer knows, no such amendment of the by-laws was made either at the Atlantic City or Indianapolis meeting. Hence, it would seem that no steps for the election of a *standing* committee can be taken by the Council until this is done; and this cannot be done until the next annual meeting.

"The Council, however, can elect a *special* Committee on Research and instruct it to outline working plans, considering all the suggestions that have been made, and report rules and regulations to the next annual meeting, or, as Dr. Stockberger puts it, 'to formulate plans for the stimulation of pharmaceutical research.'

The special Committee on Research can be elected directly by the Council membership, or the Council can request the President of the Association or the Chairman of the Council, or both, to appoint such a committee."

Motion No. 6 (Election of Members). You are requested to vote on the following applications for membership:

- No. 1. Edmund H. J. Kochanski, 1142 8th Ave., Milwaukee, Wis., rec. by S. A. Eckstein and H. G. Ruenzel.
- No. 2. Robert Henry Lewis, Jr., P. O. Box 85, Gulfport, Miss., rec. by W. P. Porterfield and Wm. B. Day.
- No. 3. Jose M. Berengner, Santiago de Cuba, Oriente, rec. by J. G. Diaz and J. P. Alacan.
- No. 4. Albert J. Martin, 3416 S. Spring Ave., St. Louis, Mo., rec. by H. M. Whelpley and F. W. Sultan.
- No. 5. Edward C. Reick, 3201 Central Ave., Indianapolis, Ind., rec. by H. W. Rhodehamel and Francis E. Bibbins.
- No. 6. Edward William Koch, 2257 N. Illinois, Apt. No. 3, Indianapolis, Ind., rec. by Charles R. Eckler and Francis E. Bibbins.
- No. 7. Clara C. Hulskamp, 546 West St., Catherine, Louisville, Ky., rec. by Anna G. Bagley and Elizabeth Jenkins.
- No. 8. James Cook Fuller, 1012 Baltimore Ave., Kansas City, Mo., rec. by Paul L. Hess and Wm. Federmann.
- No. 9. William Wilson Rose, Georgetown, Delaware, rec. by Charles H. LaWall and Harold B. Mead.
- No. 10. Miguel Saavedra Salinas, 16 Principal St., Ceiba, Porto Rico, rec. by Wm. B. Day and Clyde M. Snow.
- No. 11. Alfred Frederick Brisson, U. S. S. Nereus, U. S. Navy, rec. by Wm. B. Day and J. F. Rupert.
- No. 12. Cesar Daniel Andrade, P. O. Box 703, Guayaquil, Equador, S. A., rec. by Robert P. Fischelis and Charles E. Vanderkleed.
- No. 13. Ernest Oreste Bianco, 2120 Crotona Ave., New York, N. Y., rec. by Jacob Diner and G. Horstmann.
- No. 14. Otto F. A. Canis, Jerome Ave., Ozone Park, New York, rec. by Jacob Diner and Gustave Horstmann.
- No. 15. John Nesbit Swan, Univeristy P. O., Miss., rec. by H. M. Faser and Wm. B. Day.
- No. 16. George Ernest Elwers, 1625 Grand Ave., Milwaukee, Wis., rec. by H. G. Ruenzel and S. A. Eckstein.
- No. 17. Anton Hogstad, Jr., So. Dakota State College of Agri., Brookings, S. D., rec. by Charles H. LaWall and M. R. LaWall.
- No. 18. Frederick Clinton Dodds, Dept. of Registration and Education, State Capitol Bldg., Springfield, Ill., rec. by Wm. B. Day and E. N. Gatherer et al.
- No. 19. Walter A. Ritter, 629 Peosta Ave., Helena, Mont., rec. by E. M. Krembs and Frank R. Keating.

J. W. ENGLAND, *Secretary*.

A. PH. A. COUNCIL LETTER NO. 4.

PHILADELPHIA, PA., November 15, 1917.

To the Members of the Council:

GENTLEMEN:

Motion No. 5 (Appropriation of \$75 for A. Ph. A. Buttons and Pins), and Motion No. 6 (Election of Members; Applications Nos. 1 to 19, inclusive) have each received a majority of affirmative votes.

Under date of October 30, F. J. Wulling writes:

"Because I was drafted into our local Liberty Loan campaign I have not had an earlier opportunity of replying to the Council Letter No. 2.

"1. I suppose the Chairman of the Council or the President of the Association will appoint a committee to draft suitable resolutions on the death of our friend, Prof. Charles Caspari, Jr.

"2. Dr. Kremers expresses my sentiments. A strong Council committee might be able to do the work suggested by him. The A. Ph. A. certainly should do something in the matter. Investigation of, and effective administration upon a matter such as this would be part of the functions of the federation of all pharmaceutical bodies that I recently recommended.

3. On the whole, I indorse Dr. Stockberger's position in the matter of a Committee on Research and I hope the matter can be pursued to a fruitful and satisfactory end.

"4. Dean Sayre's point that the Research Committee be requested to formulate plans for the *stimulation* of research rather than for *regulating* and *ruling* research is well taken, but I suppose the Committee would give such full consideration to its duties involved that it would not attempt to lay down any arbitrary rules that would defend the intention underlying the creation of the Committee."

F. J. Wulling writes (Nov. 1, 1917):

"Council Letter No. 3 at hand. Voting card has already been mailed. Your own statements on pages 10 and 11 clarify the situation. No doubt you are right that no steps were taken to create a standing Committee on Research. The remedy now is the creation of a special committee as you suggest. Of course just as much care should be exercised in the selection for the composition of the special Committee as would be observed in the composition of the standing committee. I suppose the most expeditious method of creating the Committee would be for the Council to request the Council chairman and the Association president to join in the appointing of the Committee. If a better way suggests itself, that would be the one to employ, but I would urge the least possible delay in the establishment of the Committee."

Harry B. Mason writes:

"Apropos of the recent discussion in the minutes of the Council with reference to the Committee on Research, please permit me to express the opinion that Mr. Dewood's suggestion is deserving of consideration, namely, that a chairman of the Committee be appointed and that he be asked to recommend names for the remaining positions of the Committee. A good man like Dr. Edward Kremers, or Professor F. B. Power, of Washington, could be depended upon to make some very intelligent recommendations. Professor Power already represents pharmacy on the Research Committee of the A. A. A. S. and stands right at the front in pharmaceutical research. Dr. Kremers would also command universal respect and there are a number of other men any one of whom could be depended upon to make an efficient chairman and to be of real service in suggesting men for the Committee as a whole.

"There is a great need that pharmacy should get public credit for what it is doing. That is what has helped make medicine so powerful politically. The public, through the popular press, is being constantly informed of the 'wonderful' progress, discoveries and accomplishments that medicine is making. Pharmacy must get into the same line of activity—and this is one very important function of the new Research Committee. The purpose of the Committee is not so much to *do* research itself as to stimulate and utilize it, and in view of the great importance of this Committee it seems vital that the membership should be very carefully selected."

In re matter of Committee on Research, H. V. Army writes:

"We need a committee of ten to handle the matter. As has been pointed out (C. L. No. 3) the Committee must be a special one this year. The suggestion has been made to nominate the five members of the Scientific Section Committee. We had last year a Council Committee on Financial Control of the N. F. whose recommendation that the apparent profits of the N. F. be placed in a Research Fund started the discussion in the final session which is now continued in the Council. This Committee consisted of five members.

"Now, why not take these ten members as a starter, call for at least five other nominees, and have the entire Council vote for ten of the fifteen members?

"There is no gainsaying the fact that this Committee has work of great importance before it and should consist of the best men available.

"There should be no snap judgment in the matter of selection and, on the other hand, the ballot should be a representative one. I should particularly regret if the election should not have at least fifteen nominees from which to make a selection."

L. E. Sayre writes:

"I move, as suggested by Secretary England (Letter 3, p. 11), that a *special* Committee on Research be elected and that it be instructed to outline working plans and to formulate plans

for the stimulation of pharmaceutical research, and report at the next meeting of the Association.

"In this connection, the mover would ask members to recall his remarks regarding this Committee in connection with Dr. Stockberger's. See Letter No. 2, p. 6."

The situation with reference to the Committee on Research is somewhat complicated but easy of solution.

The Committee directed to be established by the final general session of the Association at Indianapolis was to be a standing committee. As such action was in violation of the by-laws of the Association it falls. L. E. Sayre's motion (as above) that a *special* Committee on Research be elected is therefore in order. It is seconded by J. W. England and will be regarded as *Motion No. 7 (Establishment of special Committee on Research)*.

It will save time, also, if the other motions made are voted upon at this time, conditional, of course, upon the passage of Motion No. 7, for the establishment of the special Committee, to which no objection has been made. The three motions referred to (Nos. 8, 9 and 10) are as follows: the motion of these receiving the highest vote will carry:

Motion No. 8 (Selection of Special Committee on Research). Moved by F. J. Wulling, seconded by F. E. Stewart, that the Council chairman and the Association president join in the appointing of the special Committee on Research.

Motion No. 9 (Nomination of Special Committee on Research). Moved by Harry B. Mason, seconded by W. L. Dewoody, that a chairman of the special Committee on Research be appointed and that he be asked to recommend names for the remaining positions on the Committee; to be voted upon by the Council.

Motion No. 10 (Nomination of Special Committee on Research). Moved by H. V. Army, seconded by C. A. Mayo, that there be placed in nomination for election by the Council fifteen nominees, as follows: The five members of the Scientific Section Committee, the five members of the Council Committee on Financial Control of N. F. and five additional nominees to be named by the Council; from these fifteen nominations, the ten members are to be elected.

Motion No. 11 (Election of Members). You are requested to vote on the following applications for membership:

- No. 20. Eugene Von Hermann, 122 S. Michigan Ave., Chicago, Ill., rec. by Wm. B. Day and Wm. Gray.
- No. 21. Julius G. Rapoport, N. W. Cor. Front and Christian Sts., Phila., Pa., rec. by Eugene G. Eberle and J. W. England.
- No. 22. Armin Herrman Hauenstein, 414 S. Main St., Bluffton, Ohio, rec. by Wm. B. Day and Sidney Hauenstein.
- No. 23. Rene Rodriguez, Sarin Hall, Notre Dame, Ind., rec. by R. L. Greene and Emil Reyer.
- No. 24. James Wilburn Patteson, Oak Cliff Pharmacy, Dallas, Texas, rec. by J. M. Fletcher and Harry Deathe.
- No. 25. Lottie Hargreaves, 2725 N. Front St., Philadelphia, Pa., rec. by E. G. Eberle and J. W. England.
- No. 26. Edward R. Hancy, 666 N. 57th St., Phila., Pa., rec. by E. G. Eberle and J. W. England.
- No. 27. Rudolph K. Dorfman, 480 N. Orianna St., Phila., Pa., rec. by E. G. Eberle and J. W. England.

415 NORTH 33RD STREET.

J. W. ENGLAND, *Secretary*.

A. PH. A. COUNCIL LETTER NO. 5.

PHILADELPHIA, PA., November 16, 1917.

To the Members of the Council:

GENTLEMEN:

General Secretary Day writes:

"Following a successful meeting of the Chicago Branch on the 26th of October, and a subsequent meeting of the officers and executive committee of the Branch, we are now ready to go ahead with arrangements for the 66th annual convention. Preparatory to making these arrangements, the following motions are offered:

"1. Moved by C. M. Snow and seconded by W. B. Day, that the 66th annual convention of the American Pharmaceutical Association be held in the week beginning August 12, 1918.

"In selecting this meeting date, we have consulted the Secretary of the National Association of Boards of Pharmacy who was very anxious that the date fixed should not be too near either the first or the last day of the month, and especially not the last, because it interferes with many of the board members, who feel that they must be back at their stores on the first of September. We have also consulted with the Secretary of the National Association of Retail Druggists and, although the date for the annual meeting of that organization has not yet been fixed, he assures us that there will be no conflict.

"2. Moved by W. B. Day and seconded by C. M. Snow that E. N. Gathercoal, of Chicago, be nominated for Local Secretary.

"Mr. Gathercoal has been very active in the Chicago Branch and its secretary for the past six years. He is in a position to keep in close touch with the arrangements for the meeting and will give these arrangements his careful attention."

Motion No. 12 (Approval of Time of Holding the 66th Annual Convention of the American Pharmaceutical Association). Do you favor the motion that the 66th annual convention of the American Pharmaceutical Association be held in the week beginning August 12, 1918?

Motion No. 13 (Election of E. N. Gathercoal as Local Secretary for 1918). Do you favor the election of E. N. Gathercoal, of Chicago, as Local Secretary for 1918?

415 N. 33RD STREET.

J. W. ENGLAND, *Secretary*.

A. PH. A. COUNCIL LETTER NO. 6.

PHILADELPHIA, PA., November 20, 1917.

To the Members of the Council:

The sad news has just been received of the death of Charles Holzhauer, President of the American Pharmaceutical Association, who died suddenly of apoplexy on Monday, November 19, 1917. The funeral services will be held to-morrow, 2.00 P.M., at his late home, 732 High Street, Newark, N. J.

415 N. 33RD STREET.

J. W. ENGLAND, *Secretary*.

COMMITTEE REPORTS

REPORT OF THE GENERAL MEMBERSHIP COMMITTEE.

TO THE PRESIDENT AND MEMBERS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION:

The work of the General Membership Committee during the past year was conducted along the same lines as heretofore. Immediately following the convention at Atlantic City a letter was sent to every district and state chairman, urging them to undertake the campaign at once and asking them for suggestions concerning the personnel of their committees for the coming year. Two months later, a second letter was sent to every member of the committee. With this letter were sent stationery and application blanks and the members were advised of their appointment on the new committee and urged to use their efforts to build up the membership of the Association. A third letter was sent out early in the Spring and in this connection the state chairmen were given the names of the members of boards of pharmacy and officers of state associations not already in the membership of the American Pharmaceutical Association and requested to make a special effort to secure the applications of these persons.

The results of the campaign have not been altogether satisfactory, but it must be borne in mind that the many demands made upon the time and funds of every pharmacist by reason of the great war have made it difficult for all organizations to add to their membership, and, perhaps, under these unusual circumstances, we do well to hold our own. During the past year 315 new members have been elected. However, the losses during the same period have been exceptionally heavy, amounting to 291 and cutting the net gain for the year to 24 members. The total membership at the present time is 2697.

NEW MEMBERS ELECTED SEPT. 1, 1916, TO SEPT. 1, 1917, AND GROUPED BY STATES AND MEMBERSHIP DISTRICTS.

| District No. 1. | District No. 2. | District No. 3. | District No. 4. |

TEN YEARS OF THE FOOD AND DRUGS ACT.

Ten years of enforcement of the Food and Drugs Act of June 30, 1906, are reviewed in the current annual report of the Bureau of Chemistry, U. S. Department of Agriculture.

The general effect of the Food and Drugs Act may best be estimated, says the report, by considering its effect upon food and drug control by the States; upon development of the food and drug industries and by the principal abuses that have been corrected. But to illustrate the scope of the work through figures and facts the report points out that more than 6,000 prosecutions have been terminated in the courts in the first decade of the Act; that manufacturers have been cited at hearings more than 40,000 times, that many thousands of factory inspections have been made, and that more than 750,000 shipments of domestic or imported food and drugs have been examined.

One consequence of the enactment of the Food and Drugs Act was to encourage similar legislation in many of the States, the purpose of which is to control local traffic in food and drugs which, since no interstate commerce is involved, are not subject to the Federal law. The Federal law supplements the State law in this respect and now most of the States have similar laws. In the beginning the confusion and apparent conflict between local and Federal laws and administration of laws not only made it difficult for the two sets of officials to co-operate, but often made it necessary for manufacturers to make special preparations for shipment to certain States at extra cost, the extra cost being passed on to the ultimate consumer. This evil has been remedied to a considerable extent by the organization of two agencies which in a large measure have removed some of the difficulties arising from the conflict of Federal and State jurisdiction. These agencies are: (1) The Joint Committee on Definitions and Standards, and (2) The Office of Cooperative State and Federal Food and Drug Control.

Frequently, the report says, the Bureau is appealed to by the industries to compel the cessation of unfair practices and to encourage the standardization of the products, when the industry is incapable by itself of bringing about these results. The Act is described as one of the influences which have helped to draw competitors together into associations like the guilds of the middle ages, although the modern associations lack the special privileges which the ancient guilds often enjoyed.

Some of the associations, understanding the value of constructive work, now devote considerable money to experimental research into technical problems. Thus is made available to the small manufacturer scientific assistance ordinarily beyond his reach. Since the Bureau of Chemistry always has regarded it as its duty not merely to report violations of the law but also to prevent accidental violations, through constructive work in tending to improve methods of manufacture, it coöperates actively with such associations of manufacturers. Such coöperation, by the various Government agencies, says the report, is bound to exert the profoundest influence on the country's industrial and social development.

The best evidence, according to the report, that many of the abuses formerly occurring in the food industry have ceased is found in the fact that the violations of the Food and Drugs Act observed to-day are hardly comparable, in degree, with those in the first few years following the enactment of the law.

MILITARY ORGANIZATION.

A company, now, is composed of 250 men, commanded by a captain.

A battalion consists of four companies, commanded by a major.

A regiment consists of three battalions, a machine gun company and a headquarters company band, commanded by a colonel.

A brigade is composed of three regiments, commanded by a brigadier-general.

A division consists of three brigades of infantry, one brigade of artillery, one regiment

of cavalry, a battalion of engineers, an air squadron, a battalion of signal troops, and a motor train and wagons.

With a division there are nearly 10,000 animals, and an army of attendants, besides 600 motor trucks and their drivers, a dozen airplanes, four dozen ambulances and three dozen automobiles, 75 big guns, and about 300 other carriages.

NEW YEAR'S DAY.

The Robertson-Bradshaw Company has issued a New Year message worth repeating and so we publish it.

New Year's Day means another chance.

Thank God there's always another chance.

Whoever said that Opportunity knocks once, meaning once only, at every man's door, was fooling you. Don't believe it. For opportunity comes around to your door every morning, regularly as the milkman.

We don't have to live our lives all at one stretch; if so, WHO would endure a week? But our lives are allotted to us in day by day parcels. And between every two days of life we are dipped in death.

Every morning is a resurrection. And New Year's day is "the Great Gittin' Up Mornin'." The Past is sloughed off. Its mistakes we bury. Its successes will not do for next year. Into the dump with all of 'um!

DESTINY on New Year's Morning is dealing us a New Hand. Sit up, gentlemen! Smile, and try again! The game goes on. Better luck this year! Come! We'll try again.

And may God bless us all!

Dr. J. H. Beal has received the endorsement of the National Association of Retail Druggists for place on the Advisory Commission to the National Council of Defense. At a meeting of the chairmen of six organizations represented in the National Drug Trade Conference a like endorsement was unanimously given. It is not unbecoming to say that no one would be more acceptable to the drug trade of the country, and it is to be hoped that he will consent to accept. In this connection it should be said that few, if any, have and do give as much of their time for the benefit of pharmacy as Doctor Beal.

Cyrus P. Walbridge, president of the J. S. Merrill Drug Company of St. Louis, recently suffered a stroke of paralysis, from which he is recovering. Mr. Walbridge was vice-president of the St. Louis World's Fair and prominent

in political and civic affairs. While a member of the American Pharmaceutical Association, he has been more actively interested in the National Wholesale Druggists' Association, of which he was president in 1898.

Prof. C. T. P. Fennel, dean of the Cincinnati College of Pharmacy, has been appointed professor of Materia Medica in the University of Cincinnati.

Kenneth B. Hay, son of deceased member Charles La Mar Hay, DuBois, Pa., a second-year student of the Philadelphia College of Pharmacy and who enlisted in the Pennsylvania Hospital Unit No. 10, died in France on Thanksgiving Day.

Pharmacist's Mate Elzer Harwell, whose home is at Scotts Hill, Tenn., and one of the officers and crew of the U. S. Destroyer "Fanning" was given honorable mention not only by the commander but also by the British commander-in-chief, in the destruction of a German submarine November 24. The special act of bravery for which he was commended was for jumping overboard and saving a drowning German.

Mallinckrodt Chemical Works celebrated the fiftieth anniversary of the founding of its business, December 19, by giving a banquet at the Mercantile Club, Saint Louis. It was one of the most notable events occurring in the local drug and chemical trade circles for a number of years. About 150 guests were present, including the representatives of the various branches, heads of departments, etc.

Mr. L. G. Blakeslee presided as toast-master and interesting and appropriate remarks were made by Messrs. Edward Mallinckrodt, Sr., President of the company; Edward Mallinckrodt, Jr.; O. L. Biebinger, Secretary; H. T. Jarrett, Manager of the New York house; L. G. Ryan, Manager of the Canadian house; J. H. A. Fink, Export Department, New York City; H. W. Huning, who has been with the house since its organization; also by Messrs. Dronberger, Appleton and other representatives.

One of the most important features of the evening was the presentation to Mr. Edward Mallinckrodt, Sr., on the part of the employees, of a beautiful bronze tablet or medallion prepared from one of his recent photographs. The presentation was made by Mr. Blakeslee with very appropriate and impressive words, and Mr. Mallinckrodt's response was largely in the way of a review of the leading events in the history of the company.

OBITUARY.

IN MEMORY OF CHARLES HOLZHAUER.

*(Continued.)*RESOLUTIONS ADOPTED BY THE EXECUTIVE
COMMITTEE OF THE NATIONAL ASSOCIATION
OF RETAIL DRUGGISTS.

WHEREAS, it was the will of Almighty God to remove from our midst Charles Holzhauer, President of the American Pharmaceutical Association; be it

Resolved, That, on behalf of the officers and members of the National Association of Retail Druggists, we do hereby extend our deep sympathy and express our profound regret to the officers and members of the American Pharmaceutical Association and the family of our distinguished deceased fellow pharmacist.

(Signed) W. H. COUSINS, *President*.

SAMUEL C. HENRY, *Secretary*.

JAMES F. FINNERAN,

Chairman Executive Committee.

Chicago, December 8, 1917.

EDWARD A. SAYRE.

The sudden death of President Charles Holzhauer has shocked the entire profession. Since he joined the American Pharmaceutical Association in 1873, he has been a consistent member, rarely missing a meeting. He enjoyed the gatherings of so many kindred spirits. He was a self-made man; he was a good listener; he heard what others had to say, sometimes enjoying the debate, but regretting the waste of time on matters of little importance. If he spoke, it was when a lull came, and then in a few quiet words he showed that he had digested what had been said and usually he had the last word. His was a judicial mind. Every honest pharmacist has lost a friend, he was my life-long friend, more like a brother; my loss is the greater.

WILLIAM B. DAY.

Coming so soon after the Indianapolis meeting, where President Holzhauer took so active a part and appeared so well and vigorous, his death was a great shock to me. The American Pharmaceutical Association and pharmacists generally have lost a most loyal friend and advocate. Charles Holzhauer's labors in his chosen profession were fruitful but by no means represented the full measure of his activities. A public-spirited citizen, he gave to his city the same loyal support

and the same endeavor to promote the welfare of its citizens that made him a conspicuous exponent of what is best in pharmacy. The Association can ill afford to lose his services. His death breaks another link in the chain of those earnest workers who did so much for the upbuilding of the American Pharmaceutical Association and for pharmacy.

J. H. BEAL.

I was more deeply grieved than I can state to learn of the sudden death of President Holzhauer.

President Holzhauer was a fine type of American pharmacist. His sturdiness, manliness and straightforward methods endeared him to the membership of the American Pharmaceutical Association to which for so many years he rendered loyal and valuable services.

Mr. Holzhauer never put himself in the way of honors. The various offices which came to him were unsought, and were bestowed because of his known faithfulness in the discharge of every duty entrusted to his care.

His election to the presidency of the American Pharmaceutical Association was a just recognition of his character and services, and there is not a member who does not feel a sense of personal loss in his death, and who does not grieve that he could not have been spared at least to round out his year of administration in the office which he regarded as the highest of all honors.

H. V. ARNY.

The Association has lost more than a president, it has lost a faithful, devoted member. Pharmacy has lost more than a careful druggist, she has lost a leader. Mr. Holzhauer's personal acquaintances have lost more than a pleasant companion, they have lost a good counsellor, a generous associate, a friend as true as steel.

C. T. P. FENNEL.

The news of the death of Charles Holzhauer was a shock indeed. I have known him for over thirty years and from the first day of friendship was strongly attracted to him by his kindly disposition, "open and above board" character, sound judgment on the ideals of American pharmacy. We have again lost one who was a credit to himself and family, citizenship and society and to American pharmacy.

L. E. SAYRE.

The death of President Charles Holzhauser is another sad blow to the band of faithful workers in our Association and I cannot tell you how much and how deeply I feel the loss of this good man whose untimely death has left the presidency of the Association vacant.

JOHN F. FISCHNAR.

John F. Fischnar died suddenly at his residence at 6920 Perry Ave., Chicago, Nov. 12, 1917. He was born at New Ulm, Texas, in 1878. His education was obtained through his own efforts largely and under adverse circumstances. He entered the Northwestern University School of Pharmacy in 1890, graduating with the degree of Pharmaceutical Chemist and a high record for scholarship.

In 1904 he was happily married to a classmate in the Pharmacy School, Miss Nina Piper, who survives him. In 1905 he purchased a drug store at Sixty-ninth St. and Wentworth Ave., and conducted it successfully to the time of his death. He was a member of the faculty of the Northwestern University School of Pharmacy for about ten years as an instructor in the Pharmacy Department where he was highly esteemed by his colleagues and greatly respected by his students.

He became a member of the American Pharmaceutical Association in 1905 and was elected a vice-president of the Chicago Branch of that Association for 1917. He was also a member of Normal Park Masonic Lodge No. 797 and of the Chicago Retail Druggists' Association. He was a man of sterling character and very steadfast in his friendships. The stores in the neighborhood were closed during the funeral services showing the regard in which he was held by his business associates.

M. A. MINER.

CHARLES T. GEORGE.

Charles Theodore George, pioneer druggist of the West End, Harrisburg, Pa., and for many years secretary of the Pennsylvania Pharmaceutical Examining Board, died at his home December 26th.

The deceased was born in Homberg, Landgraviate of Hesse, Germany, February 2, 1845, and came to America when a lad of six years. He was educated in the public schools of Harrisburg, after which he entered the drug business and soon after reaching his majority opened a drug store on his own account. He was a member of the Philadelphia College of

Pharmacy, an honorary member of its Alumni Association and also of the University of Western Pennsylvania. For many years he was a dominating figure among the druggists of Pennsylvania, and stood for high ideals in his profession.

CHARLES T. GEORGE

He was a member and president of the Harrisburg Board of School Directors, active in Masonic and church circles. In the former he had received nearly all of the degrees in both York and Scottish Rite bodies; in the latter, he had helped in the organization of the Bethlehem Lutheran Church, of which he was a life-long member.

Mrs. George died about four years ago, and he is survived by one daughter, Mrs. Raymond E. Reed, two grandchildren and two great-grandchildren.

Mr. George joined the American Pharmaceutical Association in 1873.

AARON B. CALISHER.

Aaron B. Calisher, treasurer of the Manufacturing Perfumers' Association of the United States, died December 10, at his home in New York City, aged sixty years. He was senior member in the firm of Calisher & Co., and was a controlling factor in the business of Oakley & Co.

JOURNAL OF THE SOCIETIES AND COLLEGES.

WAR COUNCILS COMMITTEE OF THE CHAMBER OF COMMERCE OF THE UNITED STATES.

The above-named committee met in Washington December 12th; the appointees from the American Pharmaceutical Association were Messrs. S. L. Hilton, A. R. L. Dohme and J. H. Beal. The object of the committees is to give the Government the benefit of the suggestions and advice of the industries involved. The several associations of the drug trade represented were the American Pharmaceutical Association, the National Association of Retail Druggists, the National Wholesale Druggists' Association, the American Association of Proprietary Medicines, the American Drug Manufacturers' Association and the National Association of Pharmaceutical Chemists. At a meeting of the latter bodies it was decided, in view of the request by the War Councils Committee, that one organization represent the drug industries, that the National Drug Trade Conference be designated. A meeting has been called to meet in Baltimore, January 3rd. Dr. J. H. Beal was named as the unanimous choice for general representative and as the Government expert to work with the Council of National Defense. At this writing it was not decided whether he could accept the appointment.

THE NATIONAL PHARMACEUTICAL SERVICE ASSOCIATION.

Three hundred and forty-five new members were added to the roll of the National Pharmaceutical Service Association at its seventh monthly meeting held at the Philadelphia College of Pharmacy, Tuesday evening, December 11th.

Dr. Henry P. Hynson of Baltimore, who had been invited to speak on the organization of a Pharmaceutical Corps in the Army, stated that there were two ways open to pharmacists for securing such a corps. One was to induce the medical profession and the Surgeon-General's office to favor such a measure, and the other was to have a bill similar to the Edmonds Bill passed by Congress over the head of the Surgeon-General. Dr. Hynson told of his connection with the Rotary Clubs and of the coöperation that could be afforded the movement for the passage of the Edmonds Bill by Rotarian pharmacists. Dr. Hynson said that he would make it his first "order of business" to secure the coöperation of Rotary Clubs

throughout the United States in behalf of the Edmonds Bill. He also mentioned the desirability of having the support of the National Drug Trade Conference in pushing this measure through Congress.

Mr. Caswell A. Mayo of New York, who had also been invited to speak on the Edmonds Bill, made a very interesting address based on his experiences in the various camps which he has had an opportunity to visit. He declared that it was absolutely necessary for the welfare of our Army to have adequate pharmaceutical service and urged that subscriptions be asked for so as to swell the funds of the N. P. S. A. sufficiently to be able to carry on an active propaganda in behalf of the measure. It was moved, seconded and carried that the secretary send out letters asking for contributions for this work and it was also decided that the Executive Committee be instructed to prepare literature telling of the work of the N. P. S. A.

Upon motion by Mr. Eberle it was decided to ask the National Drug Trade Conference and other associations for their active coöperation in this work.

A hearty vote of thanks was given Mr. Mayo and Dr. Hynson for their attendance at the meeting and for the messages which they had brought.

1918 N. A. R. D. CONVENTION AT NEW ORLEANS.

The Executive Committee of the National Association of Retail Druggists at their recent meeting in Chicago selected New Orleans, Louisiana, the place for the 1918 meeting of the association.

AMERICAN METRIC ASSOCIATION.

The annual meeting of the American Metric Association was held at the University of Pittsburgh, December 28th and 29th. Among those who presented papers and addressed the body were—George W. Perkins of New York, J. W. McEachern, of the Crane Company, Chicago; Dr. William C. Wells, chief statistician of the Pan-American Union; Henry D. Hubbard, of the United States Bureau of Standards; and Dr. John D. Brashear, past president of the American Society of Mechanical Engineers.

AMERICAN CHEMICAL SOCIETY.

A fund has been started by the American Chemical Society for a suitable memorial

to Joseph Priestley, who came to Philadelphia after being ordered out of England; he later moved to Northumberland, Pa., where he died and is buried.

The committee has made the following recommendations:

1. That a bust portrait of Joseph Priestley be secured; that this be retained by the American Chemical Society, but be deposited as a loan in the National Museum in Washington.
2. That a gold medal be awarded at intervals of probably more than one year for superior achievement in chemical research, the award to carry with it the requirement that the recipient shall deliver an address before the general meeting of the society at the time of the presentation or at such other time and place as the council of the society may direct.

BALTIMORE DRUG EXCHANGE.

The Baltimore Drug Exchange held its annual meeting December 13th. Dr. A. R. L. Dohme spoke on pharmacy, past, present and future, outlining the changes that had taken place, and James E. Hancock also spoke. The following officers were elected:

President, A. E. Mcaly; *First Vice-President*, J. Emory Bond; *Second Vice-President*, James E. Hancock; *Secretary*, George M. Armor; *Treasurer*, H. H. Robinson; *Executive Committee*, W. M. McCormick, and Dr. A. R. L. Dohme.

THE NEW YORK GERMAN APOTHECARIES SOCIETY.

The German Apothecaries Society of New York has celebrated its sixty-sixth birthday; A Christmas meeting was held December 27th, to which the members and their families were invited and a regular meeting of this time-honored organization was held January 3rd. The special meetings are social and invariably successful and enjoyable.

MASSACHUSETTS COLLEGE OF PHARMACY.

A service flag, containing thirty stars, was unfurled at the Massachusetts College of Pharmacy on Monday noon, November 26th. Short addresses were made by President Herbert Packard and Dean Theodore Bradley. Instructor Florin J. Amrhein read a list of the names of those represented by the stars on the flag which was unfurled by Bertha Sugden, Ph.G., a graduate student at the College. The thirty stars represent one officer of the College, five members of the class of 1917 who went directly from the College into military

or naval service, and twenty-four undergraduates. About the same number of graduates of the College are also in the service, but stars are not included for them on this flag, which represents the present student body.

THE COLLEGE OF PHARMACY, UNIVERSITY OF MICHIGAN.

The Pharmacy Faculty of the College of Pharmacy, University of Michigan, in an endeavor to do its bit to support the Edmonds Bill, recently drew up the following petition, a copy of which was sent to all United States Senators and Representatives from Michigan:

"We, the undersigned, wish to call your attention to the following reasons why we urge your support of the Edmonds Bill known as Number H. R. 5531, which will be brought up in the December session of Congress, and which is intended to increase the efficiency of the Medical Department of the United States Army, to provide a Pharmaceutical Corps in that Department, and to improve the status and efficiency of the Pharmacists in the Army:

"First. It will increase the efficiency of the Medical Corps of the U. S. Army by supplying a place for specially trained men who can coöperate with physicians and surgeons.

"Second. The enlistment of the professional services of properly qualified pharmaceutical chemists will enable physicians and surgeons to devote more of their time to the diagnosis and direction of the care of sick and wounded.

"Third. It will give the profession of Pharmacy a standing in the Medical Corps, and will afford an opportunity for the promotion of pharmacists for special services which they may render, and place the profession on the same basis as that already established for Dentistry and Veterinary practice.

"Fourth. Not only as a war measure, but in the development of the U. S. Army in times of peace, there must of necessity be developed a closer association between pharmacists and the medical profession."

It is interesting to know that President Hutchins' name headed the list of signers, and was followed by the names of the Pharmacy Faculty, all the druggists of Ann Arbor, and the students of this College.

PHILADELPHIA COLLEGE OF PHARMACY.

The Philadelphia College of Pharmacy has a flag of 153 stars displayed in the college library and designates that from among the recent graduates and student body that number have enlisted in the Government service. With few exceptions the enlistments were voluntary and so far as known, none eligible for service endeavored to become exempt from the draft.

ST. LOUIS COLLEGE OF PHARMACY.

The following resolutions were passed by the Board of Trustees at the November meeting, and a copy ordered sent to the pharmaceutical press:

PROFESSOR CHARLES CASPARI, JR.

The St. Louis College of Pharmacy records with deep sorrow the death of Professor Charles Caspari, Jr., one of America's foremost and distinguished pharmacists, teachers and pharmaceutical writers.

We recognize the extended and self-sacrificing service which he has rendered to our whole profession with the deepest feeling of gratitude and we rejoice in the sublime record made by him and in the exemplary life he has led.

Among his numerous friends, the St. Louis College of Pharmacy desires to pay its tribute of respect and esteem to his memory.

Be it therefore,

Resolved, That the St. Louis College of Pharmacy express to the family of our deceased friend and co-laborer, its deepest sympathy in their bereavement.

The College joins the pharmacists of America in honoring the memory of Charles Caspari, Jr.

The Committee,

FRANCIS HEMM,
OTTO A. WALL,
H. M. WHELPLEY,
F. W. SULTAN,
AMBROSE MUELLER.

UNIVERSITY OF WASHINGTON.

DEPARTMENT OF PHARMACY.

The Pharmacy Department of the University of Washington is "doing its bit" by encouraging farmers to collect digitalis leaves. Instructions have been set out relative to proper collection, drying and packing. If the collectors are uncertain regarding the drug, they are advised to send samples to the University for identification. In this way considerable digitalis has been harvested.

THE PHARMACIST AND THE LAW.

THE RETAIL LIQUOR DEALERS' LICENSE.

As far back as 1874, Geo. H. Schaefer, an honorary president of the American Pharmaceutical Association, advocated that retail druggists be not classed with liquor dealers. The matter was brought up at the Louisville meeting of the A. Ph. A. in the year named, and he believes that the time is most opportune now to do away with a classification which is entirely unjust.

PENNSYLVANIA BOARD OF PHARMACY GIVES NOTICE OF CHANGES IN THE STATE DRUG LAW.

The Pennsylvania Board of Pharmacy has sent out notices and comments on several sections of the amended State drug law.

Section 3 of the Drug Act has been amended and reads as follows:

"That for the purpose of this act an article shall be deemed to be adulterated.

"First. If a drug is sold under or by any name recognized by the ninth revision of the Pharmacopoeia of the United States, the fourth edition of the National Formulary, or the American Homeopathic Pharmacopoeia, it differs from the standard of strength, quality, or purity as determined by the test or formula laid down in the ninth revision of the Pharmacopoeia of the United States, the fourth edition of the National Formulary, or the American Homeopathic Pharmacopoeia; provided that no drug defined in the ninth revision of the Pharmacopoeia of the United States, the fourth edition of the National Formulary, or the American Homeopathic Pharmacopoeia except official preparations of opium, iodine, peppermint, camphor, ginger and ethyl nitrite, shall be deemed to be adulterated, under this provision, if the standard of strength, quality, or purity be plainly stated, in juxtaposition with the official standard of strength, quality, and purity, upon the bottle,

box or other container thereof, although the standard may differ from that determined by the test or formula laid down by the ninth revision of the Pharmacopoeia of the United States, the fourth edition of the National Formulary, or the American Homeopathic Pharmacopoeia.

"Second. If its strength or purity fall below the professed standard or quality under which it is sold."

Section 4 has been amended to read that an article shall be deemed to be misbranded, "If its package or label shall bear or contain any statement, design or device regarding the curative or therapeutic effect of such article, or any of the ingredients or substances contained therein, which is false or fraudulent."

All distributors of drug products are requested by the board to join in making it a rule of the trade to send United States Pharmacopoeia and National Formulary products on all orders from pharmacists for drugs under official titles with no other qualifications as to quality.

A careful study of Section 3, of the Drug Act, as amended, will show that both the standard of strength, quality and purity possessed by the article which differs from the official standard, and its official standard of strength, quality and purity must appear upon the label, side by side, of every such article sold, or offered for sale in Pennsylvania.

U. S. COURT UPHOLDS RIGHT TO INSERT DESCRIPTIVE MATTER IN MEDICINE CARTONS.

United States Circuit Court Judge Ward, with the concurrence of Judges Mayer and Hand, has ruled against the appeal of E. Fougère & Co. for an injunction restraining Attorney-General Lewis and District Attorney Swann (New York) from enforcing the Section 1142-a of the penal law in regard to the advertising of remedies for certain named diseases, by the enclosure of reading matter, or by advertising in any other manner.

In his decision, Judge Ward cites the fact that the medicines sold by the defendants which come under this provision are accompanied by statements in regard to the diseases they are intended to cure, together with the dosage, either on labels, pasted on the container, or bottle, or in a circular folded inside the container. The medicines are also advertised in newspapers and medical journals. He then continues:

"We cannot assume that the Legislature intended to require proprietary medicines for the diseases mentioned to be sold without any indication of the diseases for which they were intended, or without any direction as to the doses to be taken, nor do we think that a circular inserted in the container going, not to the public generally, but only to the purchaser, is an advertisement within the meaning of the act. Such a construction of the ordinary directions of the family physician on a bottle of medicine would be regarded as absurd."

The decision thus rules that the law of the State of New York does not prohibit the sale of remedies for certain diseases, named in the statute, even though dosage, name of remedy and other descriptive matter are cited on labels, on containers, or in circulars enclosed within the containers.—*Paint, Oil and Drug Reporter*.

STATE PROTECTION OF TRADE-MARKS.

Trade-mark protection by the several states as well as by the Federal government is discussed in *Popular Mechanics Magazine* by H. H. Windsor, the editor, who says in part:

Within the last two years several corporation lawyers making a specialty of trade-mark practice have placed increasing importance on the subject of protection of trade-marks by filing individual state applications for the same in almost every state in the United States, in addition to seeking also the protection afforded under the Federal Trade-Mark Act.

Litigation concerning trade-marks is of unusual character in that there does not seem to have been any uniformity of decision under the Federal Trade Act, due to the fact, partly, that the circumstances of the different cases are not similar. Therefore, the decision of the United States Supreme Court in the near future, in what is known as the "United Drug Company trade-mark case," is awaited with interest.

A few years ago, H. A. Jaynes was sued as agent of the United Drug Company by one Ellen M. Regis, who desired to prevent the use of the word "Rexall." The Regis woman had established the word "Rex" as a trade-mark under the state statute of Massachusetts of 1895, by filing her trade-mark in a proper application with the Secretary of State, in

accordance with the laws of the commonwealth, on Sept. 27, 1898, and the registration was given the official number 673.

The validity of the trade-mark "Rex" and the title thereto of the said *Regis*, was twice adjudicated by the Supreme Court of the State of Massachusetts after strenuously contested and protracted litigation. In the last appeal, the Massachusetts Supreme Court sustained the contention of the lower courts that the word "Rexall" was an infringement of the

word "Rex." Later, the United Drug Company paid \$100,000 for an assignment of the rights of the *Regis* mark.

It must be remembered that all one can claim under the Federal act is an "interstate trade-mark." Surely all the incidents of a common-law mark are better perfected when the state application for the registration of a mark has been made to and the right issued by the Secretary of State.—*Drug and Chemical Markets*.

CHANGES OF ADDRESS.

All changes of address of members should be sent to the General Secretary promptly

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of the change of address is received before shipment or mailing.

Both the old and the new address should be given thus.

HENRY MILTON,

From 2342 Albion Place, St. Louis, Mo.

To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or typewritten.

CHANGE OF ADDRESSES SINCE NOV. 18, 1917.

NITARDY, F. W.

From Scholtz Drug Co., Denver, Colo.

To 1418 Cherokee St., Denver, Colo.

WILLIAMSON, H. H.

From U. S. Naval Training Station, Great Lakes, Ill.

To U. S. S. *Susquehanna*, c/o Postmaster, New York, N. Y.

JORGENSEN, ARTHUR

From 1026 B. Shotwell St., San Francisco, Cal.

To 781 Castro St., San Francisco, Cal.

HILTERBRAND, E. A.

From 4011 Colonial Ave., Dallas, Texas.

To 1014 W. 18th St., Oklahoma City, Okla.

KUENZIG, P. A.

From 316 Atlantic Ave., McKeesport, Pa.

To 121 Spencer Ave., Carriek, Pa.

MAISEL, JOSEPH

From 860 Fox St., New York, N. Y.

To 989 Amsterdam Ave., New York, N. Y.

UNITED STATES PUBLIC HEALTH SERVICE.

List of changes of duties and stations of commissioned and other officers of the United States Public Health Service for the seven days ended December 5, 1917.

Phar. F. J. Harty. Relieved at the San Francisco Quarantine Station. Proceed to Cincinnati, Ohio, for duty in the studies of the pollution of navigable streams. Nov. 30, 1917.

Phar. B. E. Holsendorf. Relieved at San Juan, P. R., Quarantine Station. Proceed to Philadelphia, Pa., for duty. Nov. 28, 1917.

Phar. F. A. Southard. Relieved at Cincinnati, Ohio. Proceed to the San Francisco Quarantine Station for duty and assignment to quarters. Nov. 30, 1917.

Phar. J. A. Wolfe. Proceed to Atlanta, Ga., on special temporary duty. Dec. 3, 1917.

Phar. M. B. Berkowitz. Relieved at Norfolk, Va. Proceed to San Juan, P. R., Quarantine Station for duty and assignment to quarters. Nov. 28, 1917.

Asst. Epidemiologist T. H. D. Griffiths. Proceed to Alexandria, La., on special temporary duty. Dec. 3, 1917.

Sanitary Engineer J. K. Hoskins. Directed to supervise malaria work at Macon, Ga., and Montgomery, Ala. Dec. 4, 1917.

Sanitary Engineer R. E. Turbett. Proceed to Little Rock, Ark., on special temporary duty. Dec. 1, 1917.

Sanitary Engineer H. H. Wagenhals. Directed to supervise anti-malaria work, Augusta and Atlanta, Ga. Dec. 4, 1917.

Prof. C. W. Stiles. Proceed to Augusta, Ga., for duty in the prevention of the spread of contagious and infectious diseases. Nov. 27, 1917.

Prof. E. B. Phelps. Proceed to Portsmouth, Va., for conference with local authori-

ties in regard to selection of water supply. Nov. 21, 1917.

Phar. Henry Gahn. Relieved at Quarantine Station, Pensacola, Fla. Proceed to Norfolk, Va., for duty. Nov. 24, 1917.

Sanitary Bacteriologist C. P. Butterfield. Proceed to Manhattan, Kansas, for duty in laboratory studies in connection with the sanitation of extra-cantonment zones. Nov. 26, 1917.

BOOK NOTICES AND REVIEWS.

Essentials of Volumetric Analysis. An introduction to the subject, adapted to the needs of students of pharmaceutical chemistry. Third edition, rewritten and enlarged. By Henry W. Schimpf, Ph.G., M.D. John Wiley and Sons, Inc., publishers, New York. Cloth, 366 pp. Price, \$1.60 net.

The exhaustion of the second edition and the revision of the United States Pharmacopoeia have necessitated this third edition of Professor Schimpf's "Essentials of Volumetric Analysis." Many additions have been made, among them methods for assays of mercuric salts, phosphates and hypophosphites by means of standard sulphocyanate solution; processes for assays of chlorates, perborates, chloral, acetone, resorcinol, phenylsulphonates, arsenates, and alkali cacodylate are also included. The appendix contains descriptions of the most frequently employed indicators.

While primarily the book is intended for pharmacy students in the chemical laboratory, it is well adapted as a reference book for pharmacists when making determinations of the strength and purity of chemicals employed in dispensing. As far as the value to students is concerned much more might be said of the book with special favorable comment on the concise and clear presentation of the subject matter.

The book is divided into twenty-two chapters. A typical assay is explained and where possible and practicable other substances, in which the cited method may be employed, are tabulated. There are quite a number of other tables: for determining alcohol percentages from specific gravity; of factors for temperature and barometric corrections, etc.

Many of the changes and additions have been necessitated by the revision of the U. S. Pharmacopoeia; the pharmacopoeial term "mil" is employed instead of Cc.

The favor which the work has gained in its prior issues will doubtless be accorded this revised and enlarged edition.

E. G. E.

Everyman's Chemistry. The Chemists' Point of View and His Present Work Told for the Layman by Ellwood Hendrick, Harper & Brothers, New York. Harpers Modern Science Series, 346 pages with an appendix and an index, cloth. Price, \$2.00.

The author's preface states that "the second decade of the twentieth century has brought to the average man a general, if vague, realization of the tremendous importance of chemistry and its application in actual life. I think this has never been felt acutely before, and yet it has seemed to me that the same average man is not very well provided with a work that he could read and understand easily and at the same time get a chemical view of things."

In the object of bringing this about, the writer has succeeded. In the interesting discussion of chemical subjects there is some matter that could perhaps have been omitted from this book without detracting from its value, and the chemistry of a number of familiar things might have been advantageously included; thus, for example, no reference is made to baking powder, cream of tartar, citric acid nor gelatin, all of them of importance in the chemistry of the kitchen.

The author brings an attractive literary style to the discussion of chemical subjects, and many of our readers will recall some of the daily articles in the *New York Times* by Mr. Hendrick during the chemical exposition held in New York last September, and which aroused a general interest in the progress and application of chemistry in the industries. While in no sense a treatise on chemistry nor a laboratory guide the book will interest even the chemists and will give the laymen a more correct understanding of chemistry than conveyed by magazine articles and will bring them more in line with the chemist's viewpoint.

E. G. E.

JOURNAL ANNOUNCEMENTS.

Subscriptions: Annual subscriptions in advance, including postage: United States and Mexico, \$4.00; Canada, \$4.35; foreign countries, \$4.50. Single copies, 35 cents. Remittances should be made payable to Treasurer H. M. Whelpley, but mailed to JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, Easton, Pa., or 253 Bourse Building, Philadelphia, Pa. Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers.

Requests for Back and Missing Numbers: Requests for back and missing numbers should be sent to the Editor. Claims will not be allowed if sufficient notice has not been given of change of address, and in no case if received later than sixty days from date of issue. Notice of change of address should give old and new address.

Contributions: The JOURNAL accepts no responsibility for the opinion of its contributors. Contributions should be sent to the Editor; use only one side of the sheet for writing, and double-space the lines. Articles are accepted for publication on condition that they are contributed solely to this JOURNAL; and "all papers presented to the Association and its Branches shall become the property of the Association, with the understanding that they are not to be published in any other publications than those of the Association, except by consent of the Committee on Publication." (By-Laws, Chapter X, Article 11.)

Reprints: Authors may obtain reprints of the Eschenbach Printing Company, Easton, Pa. at the prices attached to the proof sent

them, provided the order is received with the returned proof. The prices are also given on this page. Otherwise type is distributed as soon as the JOURNAL is printed.

Advertisements: Communications relating to advertising should be sent to the Editor. Forms close on the first of each month, and copy should be in by the fifteenth of the month preceding date of issue, to receive proof. Date of issue—the fifteenth of the month. Advertising rates sent on request.

Membership: Applications for membership in the American Pharmaceutical Association may be made of any of the officials. The annual payment of five dollars covers the annual dues and subscription to the JOURNAL. Members receive, also, the publications of the Association that are distributed free of charge.

Further information will gladly be furnished by any of the officers of the Association and members.

Cost of Reprints: Reprints will be furnished at the following prices:

SCHEDULE OF RATES FOR REPRINTS, INCLUDING POSTAGE.

| No. copies. | 4 pp. | 8 pp. | 12 pp. | 16 pp. | Covers. |
|-------------|-------|-------|--------|--------|---------|
| 50 . . . | 1.54 | 3.08 | 4.62 | 6.16 | 1.27 |
| 100 . . . | 1.76 | 3.52 | 5.28 | 7.04 | 1.54 |
| 150 . . . | 1.98 | 3.96 | 5.94 | 7.92 | 1.82 |
| 200 . . . | 2.20 | 4.40 | 6.60 | 8.80 | 2.09 |

Orders may be sent to Eschenbach Printing Company, Easton, Pa., or JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, Easton, Pa., or 253 Bourse Building, Philadelphia, Pa.

SHOW YOUR INTEREST IN PHARMACY.

For several months past a request has appeared in the JOURNAL that members indicate whether they desire a cut of the insignia of the Association with name "Member" above, as appended, for their Prescription Blanks. A sufficient number of members have signified their interest and therefore these cuts may now be had by addressing the JOURNAL Office as below.

The cost of single type-cut, including postage, is fifteen cents; when two are ordered at the same time, twenty-eight cents. The charge is simply to cover cost and postage.

THE JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

253 BOURSE BUILDING

PHILADELPHIA

PENNSYLVANIA

JAMES HARTLEY BEAL

URBANA, ILL.

President of the American Pharmaceutical Association (1904); General Secretary (1911); First Editor JOURNAL A. PH. A.; Chairman of the Council A. Ph. A. for a number of years; Chairman of the Board of Trustees U. S. P. IX; President of the National Drug Trade Conference, etc.

JAMES H. BEAL

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL. VII

FEBRUARY, 1918

NO. 2

JAMES HARTLEY BEAL.

Among those who are active workers in the pharmaceutical field of to-day there are probably not many who have devoted their lives more completely and unselfishly to the best interests of that calling than Prof. James Hartley Beal, whose career began September 23, 1861, as the eldest son of Jesse and Mary McKnight Beal, of New Philadelphia, Ohio. At an early age he became his father's frequent companion on long walks in the woods and fields, and to this youthful experience he has often attributed his lasting interest in plant life and love of nature. It is still a source of pleasure to him to recall these memories of his boyhood days, during which the foundations were laid not only for the acquirement of useful knowledge and of systematic habits of study which were invaluable in after years, but for a sympathetic and life-long comradeship between father and son.

His early education was obtained in the public schools of New Philadelphia and at Jewett, Ohio. At about the age of seventeen years he began his first regular work as a drug clerk, at Uhrichsville, Ohio, and later continued for several years at Akron, Ohio. While at Akron he also carried several branches of study under tutors in Buchtel College. In 1882 he entered the School of Pharmacy of the University of Michigan, where he was able to carry the regular work of that department and also to pursue studies in other departments of the University. After a year's work at the University of Michigan, he completed a literary course at Scio College (since merged with Mt. Union College, Alliance, O.). After graduating at Scio he returned to the University of Michigan for a year's work in law and philosophy, and then entered the Cincinnati Law School, from which he graduated with "honorable mention" in 1886, and the following September was married to Fannie Snyder Young, of Uhrichsville, O. He soon after accepted a position as instructor in Scio College and in 1889 was given the chair of pharmacy and chemistry. Some years later he was elected to the chair of applied pharmacy in the Pittsburgh College of Pharmacy, and thereafter divided his time between the two institutions. In 1902 the Scio College of Pharmacy and Chemistry was established on an independent basis, with Prof. Beal as Dean, and in 1908 it was consolidated with the Pittsburgh College of Pharmacy.

Prof. Beal became a member of the American Pharmaceutical Association in 1892, and has since served in various capacities as Secretary, and then as Chairman of the Section on Education and Legislation, President of the Association (1904-5), Chairman of the Council, Chairman of the Conference of Pharmaceutical Faculties, etc., besides serving on various important committees. His first paper, on "The Definition of a Poison," was presented at the Asheville, N. C., meeting in 1894, and was rejected by the Committee on Publication. Since that date he has contributed numerous papers to the pharmaceutical press and to the

annual meetings of the A. Ph. A., of which he has so long been an active and loyal member.

In 1900 Prof. Beal was elected a member of the U. S. P. Board of Trustees, and has served as chairman of that body since 1910. In 1911 he was elected General Secretary of the American Pharmaceutical Association and Editor of the official Journal of that organization, the first number of which appeared in January, 1912. The difficult task of launching a new publication and at the same time performing the onerous duties of General Secretary—which at that time included the general supervision of the publication and sale of the National Formulary—together with the care of some considerable private interests, lead to the almost inevitable result of failing health, which compelled his resignation from the combined offices June 1, 1914. A few months later, Prof. Beal removed to Urbana, Ill., where he has a beautiful home and, although still a very busy man, has time to enjoy life more fully than during those years when business obligations claimed so large a portion of every day and often extended far into the night.

As stated in a preceding paragraph, Prof. Beal has always been a lover of nature and likes to "escape and be free in the joy of the open air." For many years it has been his custom to spend a few weeks each summer, in the company of congenial spirits, camping in the Great North Woods of Wisconsin or in the Ontario Highlands, where the finny denizens of the beautiful lakes and streams afford the true sportsman opportunity for securing an abundance of material for the "fish stories" he will take back with him to "the States" and also a welcome addition to the camp fare. To escape the rigors of the northern winters, there is also the opportunity of spending a few months at his Florida home, where he turns fruit grower on a small scale, and enjoys the pleasures and privileges of the fortunate dwellers in that delightful region.

Prof. Beal has been Chairman of the A. Ph. A. Commission on Proprietary Medicines since its organization, and has been tireless in his efforts toward the accomplishment of the work with which the Commission is charged. During his membership, covering a quarter of a century, he has always had the interests of pharmacy in view and has spared neither time nor energy for the accomplishment of those undertakings which seemed to him to be for the uplift and general betterment of the profession as a whole. In this work his thorough legal training has been of great value, while his force of character and magnetic personality command thoughtful attention to the sound arguments presented, which frequently clear away differences of opinion resulting from a mistaken view-point. One of the legislative achievements which earned for him the lasting gratitude of the people of his native state was the enactment of the Beal Local Option Law, secured by him while a member of the 75th General Assembly of Ohio, a measure which was upheld by the United States Supreme Court, and which has since served as a model for the drafting of local option laws in other states. He also drafted the "Model Pharmacy Act" approved by the A. Ph. A. at the Richmond, Virginia, meeting in 1900, a model poison law, and a model state anti-narcotic law (1903), all of which have been frequently copied from in state and national legislation. And he is frequently called upon by legislative committees for assistance in the preparation of bills of interest to pharmacists.

Prof. Beal possesses in an unusual degree the qualifications of the true teacher, and hundreds of chemists and pharmacists in the United States are proud to acknowledge that much of their professional success is due to the careful training received while under his instruction.

As drug clerk, professor of pharmacy and chemistry, author of several textbooks and many papers on pharmaceutical and general topics, Prof. Beal has been prominent in various lines of professional activity, and enjoys in large measure the respect and esteem alike of those interested with him in the struggle for the betterment of conditions affecting all branches of the drug trade and of those with whom he is associated in the world at large.

WILL PHARMACY FIND HERSELF?

IN one of Kipling's tales, "The Ship that Found Herself," the story of a newly launched ship, severely storm-tried on her first voyage, is narrated in an instructive way. Under the stress of headwinds and heavy seas, the various parts of the ship's structure—the beams, the plates, the shafting, and so on—feel the strain and pull, and voice their separate grievances, blaming everyone but themselves for the excessive burdens put upon them. The steam alone, having been through similar trials before, counsels patience and coöperation. At last the discordant elements are harmonized and integrated and the voice of the good ship "Dimbula" is heard for the first time.

This allegory holds a lesson for our profession, at this critical period in our history. Will pharmacists rise above petty and personal considerations and weld themselves firmly together into a harmonious whole? How else shall the good ship be saved? It is an old axiom that the whole is *equal* to the sum of its parts: it is the newer experience that these parts coördinated and combined are far *greater* than their sum. President Wulling's address presented a powerful plea for the union of all pharmaceutical forces and organizations. How shall the beginning be made? Does not the National Drug Trade Conference offer a nucleus? Here are represented the national associations which can speak with authority for all the branches of pharmacy. Already the Conference has made itself felt in pharmaceutical affairs. It has exercised no small influence in shaping legislation which concerns all pharmacists. The American Pharmaceutical Association has formally expressed its willingness to give the Conference added powers. Why not begin the integration here and now?

W. B. D.

MEDICINE, PHARMACY AND CHEMISTRY.

IT has been my good fortune to be unexpectedly called to fill the high office of President of the American Pharmaceutical Association as the result of the sudden and sad death of its duly elected president, my highly esteemed and respected friend, Charles Holzhauer, of Newark, N. J. Whatever plans or appointments he had made shall be my plans and appointments as well.

As his death came so early in his term of office he scarcely had time to formulate, much less carry out, any plan of action. According to my point of view it is unfortunate that the president of this association as a rule only makes his recommendations and suggestions at the meeting at which he presides and which is at the close of his term of office, thus depriving him of the opportunity of putting such suggestions into practice. For this reason I have concluded to lay before the pharmacists of this country in general and of this association in particular some ideas and suggestions which appear to me pertinent and advisable to-day. I will refrain from making any criticisms of pharmacy and of our association, but confine my remarks to constructive suggestions which I trust may induce pharmacy and all

other pharmaceutical associations as well as this association, to seriously consider the *status quo* of their profession and its associations with an end in view of meeting the needs thereof by such action as they may deem wise. I am presenting my subject in the form of a triple parallel between Medicine, Pharmacy and Chemistry, all of which are cognate sciences and closely identified and connected with one another from their inception. My presentation is to be a historical one and its survey shall cover briefly the period from Galen, who was born in 132 A. D., to to-day. This brief outline of history will point our clearer and more effectively than can words of mine why pharmacy has not kept pace with her sister sciences and why this association has not developed and grown like the great national associations of medicine and chemistry. There is a reason, and as in case of this cataclysm of war now devastating the civilized world, history reveals that reason.

Pharmacy and pharmacies originated amongst the Arab tribes at the dawn of the Christian Era. The name to be sure is of Greek origin and is derived from the Greek word *Pharmakon*, meaning a drug. The word Chemistry is, on the other hand, derived from the Arabic words "*al*" meaning "the" and "*kheme*," meaning "black earth," together, alchemy, or the black art; and later developed into "Chemistry" by omitting the particle *al* and lengthening the word. Another derivation is claimed, however, from the Greek words *chymia*, meaning alchemy, and *iatreia*, meaning medical treatment. This derivation is based upon the fact that out of a combination of the alchemists and their study of medicines given in medical treatment, resulted the science of chemistry. Medicine is derived from the Latin word, *medicina*, the art of healing, again derived from the word *mederi*, to heal. Thus the oldest of the three sciences, medicine, has a name dating from a later period in history than either of its derived sciences. Medicine dates back to Hippocrates who lived in Athens at the time of Pericles, about 430 B. C., and was supposed to be eighteenth in direct descent from Aesculapius.

Medicine developed very gradually until the time of Galen, who developed the use of vegetable drugs and herbs in pharmacies where at that time medicine was practiced with the administration of such vegetable potions and herbs as were then used. Those physician pharmacists were also alchemists and practiced during the dark ages and middle ages the so-called dark or occult arts, including necromancy, magic and much quackery and deception. From the time of Junius Firmicius about 300 A. D. we first meet the term Chemistry, from the Greek *chemen* and *chemeia*, meaning the book and the art of ennobling metals, so that chemistry really means originally the art of ennobling metals, and from this time on through the centuries, even up to the nineteenth, kings and princes were induced to employ and subsidize these alchemists to try to convert copper and lead or tin into silver and gold. Prominent among these were Geber the Arabian, Albertus Magnus, Roger Bacon, Raymond Lullus, all of whom believed that there existed somewhere the philosopher's stone, the touch of which would commute base metals into gold. Medicine employed only vegetable and herb remedies during this period, and hence the name galenicals for this class of preparations. One of these, Zorimios of Panopolis in the 4th century, describes a "water of the gods" as *Panacea* (from *Pan* and *aqua*) as a cure-all and from this is derived our word Panacea.

In the latter part of the 15th century the alchemist Basilus Valentinus developed many inorganic preparations of mercury, antimony and arsenic, and used them as medicines besides the herbs of the Galenites. Then in the 16th century we pass to the school of medical alchemists, the most famous of whom was Paracelsus. This school was called the Iatro-chemical school and its theory announced by Paracelsus was that the healthy body, being made up of certain chemical substances in solution, could when diseased be cured only by the same chemical substances. Hence he preached that Galen's theory of herbs and vegetable drugs curing the diseased body was erroneous. He hence dosed heavily with mercury salts, blue vitriol, sugar of lead, antimony salts, sulphuric acid, iron salts. While he and especially many of his pupils killed many people and were driven out of town after town, his theory gave the next great impetus to pharmacy and incidentally as well founded chemistry, for the great problem now became to invent and discover new chemical compounds for the relief of disease and this was done in the shops of the alchemist pharmacist. His successors, Sylvius, Tachenius, Van Helmont, Agricola, Glauber, Libavius and Pallissy, in consequence developed a great number of such metallic compounds as well as

some organic compounds. Here we hence see that in the early history of all three sciences, medicine, pharmacy and chemistry, all three were practically united in one and frequently practiced by one person, who however almost invariably received his training in a medical school and bore the title "Doctor." The alchemists's shop became the pharmacy and the owner of it practiced the healing art as well as the preparation and compounding of his medicines. From these shops developed through the zest for discovering new medicines, the chemist and the science of chemistry.

Later came the separation of all three during the eighteenth and nineteenth centuries and gradually the chemist became the scientific student looking for scientific laws governing the composition of matter and the changes it undergoes; the medical man became the curer of disease and the student of the human body in health and in disease, while the pharmacist became the student of the plants of the field and forest, the chemicals of the chemist and their proper preparation in forms suitable for administration as medicines. Each had his field and each field was important and required great patience, ingenuity and careful study and observation. Each science developed gradually and steadily along different lines, medicine and pharmacy confining their activities to curing disease, while chemistry not only did its share to produce new medical substances but spread out gradually over all the other branches of industry that have to do with matter of any and every kind, until to-day any industry that does not employ the latest discoveries and methods of chemistry in its processes, from the laundry up to the steel plant, can not successfully compete with its competitor that does. The chemists have for a century flocked to the universities all over the world to complete their needed knowledge and practice culminating in the securing of the degrees of "doctor of science" or "doctor of philosophy," which stamp them as broadly educated men with well-trained minds. The medical men and the pharmacists during the eighteenth and especially the nineteenth centuries sought their education in so-called colleges of medicine and pharmacy in this country. These colleges were at first most crude and were practically workshops for training the hand as well as the head in a practical knowledge of their professions. They were very much mixed in quality and in the products they turned out; some were fairly good, some were indifferently good, many were markedly inferior, and but few were high class. Many were run for the financial returns they gave to those who founded them, owned them and taught in them. The doors were wide open and anyone could make a try at learning medicine or pharmacy if he paid the fees and passed the examinations, even if he did not, as frequently occurred, attend all or even most of the lectures.

The medical college granted the degree of doctor of medicine, not so much because the course of mental training justified that exalted title, but because those practicing the science of medicine were known to the laity as doctors. The pharmaceutical college never essayed at that time the degree of doctor of pharmacy, and to its credit be this said, because the course of training and study certainly did not merit the title. Its degree was and to a large extent still is Ph.G., or graduate in pharmacy, indicating that the holder of the degree has studied, practiced and graduated in pharmacy. In those days medicine and pharmacy ran along together in standing and quality of men turned out. A change came over the scene, however, during the last decade of the nineteenth century, for then medicine became organized. All its manifold branches, instead of getting further and further apart and developing a school for surgeons, one for ophthalmologists, one for obstetricians, and gynecologists, one for dermatologists, pathologists, etc., etc., as seemed to threaten, due to the ever-increasing specialization needed to really properly become a successful medical man that could demand confidence and meet with success, came together under the aegis of the American Medical Association and formed so as to speak a medical combination or trust. To medicine's lasting credit and benefit be it said that this was a wise and far-seeing move and inured immensely to the benefit of the profession of medicine and of the general public who are their patients. Pharmacy, however, did not organize by gathering together the several branches of its profession under one roof and management, but, instead, her disintegration into more and more branches and associations continued and

even increased. There are in fact to-day no less than ten pharmaceutical associations of a national character, to wit: the American Pharmaceutical Association, the National Association of Retail Druggists, the National Wholesale Druggists' Association, the Proprietary Association of America, the American Drug Manufacturers' Association, the Association of Pharmaceutical Chemists, the National Association of Boards of Pharmacy, the National Drug Trade Conference, the National Pharmaceutical Service Association, the National Retail Drug Clerks' Association. Each of these has to do with pharmacy in some shape or another, but each is as independent of the other in policy, management, membership and location as if they belonged to different professions or industries. Medicine developed a master organizing mind, George H. Simmons, while pharmacy developed no such master mind for organization. The organization took place first and practically all allopathic medicine has rested and to-day rests in the American Medical Association. One of the first results and the wisest move made by medicine was to gradually but steadily raise the educational requirement for admission to medical colleges, and then to lengthen and strengthen the medical courses. This began in the last decade of the nineteenth century. It has reached such a stage now that three results are plainly apparent:—first, the reduction in the number of medical colleges and their gradual absorption by universities; second, the requirement of the degree of A.B. or an approximate equivalent for admission to the medical courses, resulting in the degree of doctor of medicine approximating in quality that of the doctorates of philosophy, law, science and theology; and, third, the vastly increased influence of medicine and medical men in the councils of state and nation as well as in the service of the Government. Without the thorough organization and centralization of all branches of medicine and medical associations little if any of this wonderfully powerful American Medical Association could ever have developed. It almost succeeded in creating a separate Department of Health as one of the departments of our Government, and it may yet succeed in accomplishing this result. There is danger, of course, of this American Medical Association with its 65,000 members out of 150,000 physicians in this country overreaching itself and exceeding its legitimate sphere because of its wonderfully successful growth and development of strength and power. Many signs point to this possibility but it is to be hoped for the best interests of medicine, of the public, and of pharmacy that right reason and sound judgment will prevail and prevent the present great and useful organization riding for a fall.

Chemistry, too, has been effectively and successfully organized and consolidated in the great American Chemical Society, which to-day has far more members than any chemical society here or abroad, in fact, has more than all of them together in England, France and Germany. It at first was threatened with disintegration and separation into several independent units, as is pharmacy to-day; but thanks to the liberal education and consequent broad view of its members and to the presence thereamong of wise counsellors and able organizers, it weathered the storm and is to-day a power and citadel of strength that is supplying the needs of our country, cut off as it has been from so many of its needed essential chemicals and medicines. In the crucible of this great war, chemistry has been weighed in the balance and not found wanting. This means much, much more in future growth, progress and industrial independence than most people realize or than pen can portray or financier estimate in dollars and cents. Beginning in 1895 with 950 members, it gradually

attained in 1900, 1200 members; in 1910, 4500 members, and in 1917, 10,135 members. Chemistry has been the great energizing agent of our industries. When we say only the "squeak" is lost we pay a tribute to chemistry, and every year more and more industries "lose only the squeak" thanks to their appreciating that scientifically worked out processes and utilization of waste make world competition and unexcelled products possible. This is due in large measure to the organization of the chemical forces in the coöperating and coördinating American Chemical Society, which by its two great Journals, the *Journal of the American Chemical Society* and the *Journal of Industrial & Engineering Chemistry* is offering to its members the very best there is in chemical science to-day, without which they could not well keep abreast of the times. Just so is the *Journal of the American Medical Association* offering the medical men of this country a full and more than a full equivalent for their membership fee without consideration of the great benefits its organized strength offers them in protective legislation.

Pharmacy has, as we have seen, not profited by the experience of her former sister sciences. She has not seen the light and she has not developed the organizer and Moses who is to lead her out of the desert. Instead all her ten sub-divisions as separate national associations still each carry their own overhead charges and divide the influence and weight of pharmacy in national and state councils into ten parts. The inevitable result must follow, *viz.*, an unequal fight of organization against disorganization, and while chemistry and medicine will grow and prosper steadily, pharmacy will, unless she takes the lesson to heart, stand still, which means retrograde. The American Pharmaceutical Association has 2700 members out of 50,000 pharmacists in this country, or five percent against about fifty percent for both national associations of chemistry and medicine. If her ten associations were all consolidated into one association as has been ably pointed out by President Wullig at the Indianapolis meeting of the A. Ph. A. last summer, but with each retaining its own organization as a separate section of the same, the beginning of real advance would be made. Thus consolidated and if possible all meeting at one time and place, but in various rooms and with a permanent building as a home, a permanent management by a set of competent men, who would be well paid and on their job all the year, pharmacy would soon put out new shoots and rapidly become as beautiful a tree in the garden as are to-day those of medicine and chemistry. To be sure an effort in this direction was made when the National Drug Trade Conference was established in 1912, but unfortunately that Conference is without any power to do things and in consequence has not been able to accomplish much for pharmacy, although it did bring about the enactment of the Harrison Anti-Narcotic Law by the action of its constituent organizations—a truly great piece of constructive legislation. It is possible to effect the desired consolidation of pharmacy through the agency of the National Drug Trade Conference by getting that body to agree upon the general principle of such consolidation, and then through its delegates get the several national associations it includes to approve the movement and action. To do this the N. D. T. C. should appoint a special committee of six men to attend in a body each national association meeting, and, having announced its coming and plans beforehand, present same for adoption at the meetings. Should that not prove possible, then the simplest way would be to call a special meeting of the several national associations to be attended by those of the leading

members of each and at this meeting endeavor to bring about in 1918 what medicine and chemistry have done decades ago.

At this meeting the things to be accomplished and the ways and means of accomplishing them should be discussed at length and the work thus begun continue until pharmacy will be returned to a fitting place alongside her sister sciences and a place which she so richly deserves because of the important and necessary part she plays in the every-day life of this busy-day world. Among the topics to be discussed and included in the plan then to be proposed would be pharmaceutical education and preliminary requirements, united legislative work, central testing and standard laboratory, one strong, able and valued journal, drug clerk and employers' registration bureau, patent and trademark registration bureau, legal department, accounting, shipping, advertising and cost price bureau, exchange bureau for goods of retailer and jobber, pharmacopoeial and national formulary laboratory and bureau, establishment of local branches and consolidation of same and state associations with the national body.

If, during my incumbency of this high office of president of the oldest national and most representative pharmaceutical association, the cornerstone of a movement looking to the placing of pharmacy in her proper niche in the temple of sciences shall be firmly laid, I should feel proud indeed and I would be willing to devote my share of the time necessary to subsequently complete the structure.

My appeal hence to pharmacy and pharmacists and the entire drug industry is to consolidate their interests, not their business, and organize same in such a manner that the future of pharmacy in all its branches may become as representative and its degree as respected and high in grade as are to-day those of its sister branches of medicine and chemistry.

To this end I propose to try to present to each of these national associations and their members a plea for the consolidation of pharmaceutical interests into an organized and enlarged American Pharmaceutical Association together with a concrete plan for such consolidated or federated association, and to personally attend all their annual meetings and deliver my message, imbued and enthused with the hope that my efforts may result in some positive action being taken by each national association to coöperate in the movement and plan. No industry, institution or organization ever becomes great and influential among its own devotees or the public at large, that has no vision and realization of becoming something larger, stronger or better than it was or is. Self-complacency is synonymous with stagnation and retrogression. After the war the world's attitude to coöperation and consolidation will change; for these will be understood, in the light of our fight for democracy and greater freedom, to mean greater efficiency and greater possibilities. In all probability the Sherman Law will be materially modified or perhaps repealed. It is contrary to the spirit of to-day and to-morrow and in place of splitting the corporation into wee bits and preventing its working to its best advantage in the world contest for trade following this war, the Congress should and probably will permit and legalize consolidation and coöperation tempered, however, with regulation. This is hence the psychological moment for all drug associations to consolidate and coöperate. Will they see the necessity and catch the spirit of to-day?

A. R. L. DOHME.

SCIENTIFIC SECTION

SCIENTIFIC DRUG FARMING.*

BY H. C. FULLER.

I want to precede this reel¹ that I have brought, with just a few observations on the general subject of drug propagation. There has been some misapprehension in the minds of the great majority of the people regarding the question of drug supply, and especially drug growing. Most of us here are familiar with the literature that has been going the rounds of the scientific and especially the daily press on this matter, and with the alluring stories and propositions that have been placed before the general public relative to indiscriminate growing of drugs.

As I have sized up the situation after a good many years of study, there is a demand for the drug growing industry in this country. I believe, however, that the only important factors are those manufacturers who grow drugs for their own consumption, and enterprises for growing drugs whose sole object is the propagation, curing and marketing of these products. I do not think it will ever be possible, and I do not think it should be advocated to have the small grower, the small farmer with two or three acres, undertake the general propagation of drugs. It might possibly be profitable for a man of ability and with considerable land to grow certain drugs for some proprietary manufacturer or firm that would make a contract for his whole output.

In the first place the market conditions with reference to drugs are entirely different from those relating to other crops. The units consuming drugs are limited in number. They are practically confined to the manufacturing pharmacist, the manufacturing chemist and the crude drug dealer. The retail druggist does not require large amounts of crude drugs, and those he buys he can purchase to better advantage from the wholesaler, who in turn, of course, obtains them from the crude drug dealer. The question of sales is important. In fact, that is one of the most important points of this industry, and the novice can not cope with the skill and keenness of the drug buyer and drug broker.

The question of getting proper seed to start a crop is almost hopeless until the grower has studied the situation and developed his own stock. Then there is the question of proper soil and cultivation. Each drug requires different conditions and the grower should be a botanist; and he must know something about drugs and how the plants grow on their native heath before he can attempt to grow them commercially with any degree of success.

There is the question of plant diseases. Anyone who has ever tried to grow drugs has learned this lesson and also of the different insect pests that are likely to make luscious meals of drug crops. The growing of plant drugs requires the coöperation of a plant pathologist and a good entomologist.

Many of the most important, or staple, drugs that can be grown in the United States have to be started in greenhouses. This in itself requires quite

* Scientific Section, A. Ph. A., Indianapolis meeting, 1917.

¹ Motion pictures of the drug growing industry were shown.

an outlay of capital. Then, in order to produce enough material to make it worth while, special machinery is necessary both for planting and harvesting. And as drugs are not marketable unless they are of the proper appearance, and of the proper potency, the question of curing is extremely important, and that can only be done successfully in drying houses of proper construction, with proper regulation of heat, and other constant, careful attention until the crop is thoroughly cured.

Then, finally, and one of the most important features of the whole situation, is the control laboratory, because it would be ill-advised from every standpoint to go on the market with a batch of drugs of unknown potency.

There has been much progress made during the last few years in this work. Large pharmaceutical houses in the country have established their own drug growing farms, and they have been successful. The Department of Agriculture established the camphor industry in the south, and it has become an important industry. Hydrastis, which is important in our own materia medica, has been cultivated for a great many years by growers, operating small acreages in parts of the west and northwest. In Washington they have been doing something along that line, and the films which I have brought with me illustrate some of the points that I have tried to bring out in these prefatory remarks. The pictures will take you from the spring when we begin until the present time in our operations; in fact the last picture was taken only a few weeks ago when the thermometer was 124° F. in the sun.

(A series of pictures of the drug growing industry were here shown.)

DRUG PLANT CULTIVATION—DRUG PLANT BREEDING.*

BY F. A. MILLER.¹

I will omit introductory remarks and begin immediately with the slides,² attempting only a brief explanation of the work that we have been doing.

That which we have attempted to do in Drug Plant Cultivation and Drug Plant Breeding has been along the lines of improvement and economic production. I mean by economic production, an attempt to determine the possibilities of growing the more essential medicinal plants upon a basis, that would enable us to grow them as we grow other economic plants. If we set out to grow medicinal plants, regardless of the cost of production, we can probably grow almost any of them, but if we limit ourselves to those which can be produced economically, there are limitations.

(A plot of digitalis in its first year's growth was shown, followed by others of the series.)

During the year that we were working on digitalis, we grew and tested a large number of varieties, in fact all the varieties which could be obtained from this country, England, Germany and Japan, making a special effort to obtain seed of all named varieties and species. *Digitalis purpurea*, being a domesticated form,

* Scientific Section, A. Ph. A., Indianapolis meeting, 1917.

¹ Biological Department Eli Lilly & Co., Indianapolis.

² As indicated, Mr. Miller spoke while the pictures were being shown on the screen; the subjects related to breeding and cultivation of drug plants.

has been made to produce a large number of varieties, and our aim was to find one that was better in its physiological activities than the official digitalis. It has now been found that digitalis does not need to be grown through the second year to give an active leaf, the first year's growth being fully as active as the flowering plant.

You will notice in this slide a difference in the size of the beds. These are of the nature of test plots, and consist of measured areas. By keeping accurate expense accounts of these test plots, we obtain figures which indicate the possibilities of growing the different species on a larger scale.

The next slide is a view of a selection and breeding plot of all varieties tested. Thirty-two of them were grown and tested physiologically, the results of which were published some two years ago.³ Some of the breeding work that has been done is shown in progress on this slide, the flowers being protected, of course, by ordinary paper bags to prevent cross-pollination.

We have also carried on experimental work in the greenhouse during the winter months, and this is digitalis growing in midwinter. You will notice that some plants are blooming. Digitalis is biennial but it can be brought into bloom by continuous growth without giving it the resting period which it has in its natural state.

Turning now to Cannabis, we have here a very luxuriant growth. This is a strain which we have developed by selection. Animal tests on this drug indicate about 90 to 95% activity when compared with good Indian Cannabis. This slide shows the harvesting of the same field of Cannabis, where you will note the rows to be about three feet apart, the plants being much taller than the average sized man. Some of these plants reach a height of from twelve to fourteen feet. The problems of harvesting are suggested here, where the cutting is being performed by hand. We have attempted to cure Cannabis partially in the field, cutting and binding into bundles and shocking. It is then taken under cover and the curing completed. Later the inflorescence is removed from the stems and separated from the leaves and seed. No effort has been made to eliminate the male plants. That only aids in the reduction of the percentage of seed in the finished product, and we find that we can do that more economically by allowing the plant to produce seed and then remove these at the time of curing.

We have touched lightly upon the question of fertilizers. They are necessary on some types of soil for successful drug cultivation. This slide represents a pot experiment carried out in the greenhouse with various types of fertilizer. We have in the first row, manure and potash; in the second, manure, potash and phosphorus; and in the third, phosphorus and potash. This was an attempt to determine the best fertilizers for Cannabis, and if I remember correctly, the complete fertilizer, potassium, phosphorus and nitrogen gave us the best growth.

Cannabis breeding has occupied some of our time, and we have isolated here a dwarf variety. This individual plant shows short branches and very heavy inflorescence. The inflorescence is heavier, especially on the central stem, than that found on the tall-growing variety.

Unfortunately we do not always find the combinations of characters in plant breeding, that are most desired. In this variety we have obtained a plant of much

³ See JOURNAL A. PH. A., March 1914, pp. 304-314.

better form, but which shows little activity. The variety has been tested for several years, but has never been over 40 percent as active as the Indian drug.

Some work has also been done on Stramonium. A large number of species have been under experimentation. This is a plot of mature stramonium, showing an attempt to simplify the process of harvesting. This drug has been cut with an ordinary mowing machine, the whole plant being taken in, cured, and the leaves removed after the curing process is completed. This shows the operation of cutting. The poor yield is due to the type of soil. It is not adapted to growing this plant. The ordinary farmer will tell you that Jimson will grow anywhere, but we are convinced that it is quite selective in its habitat.

Turning to Belladonna, we have here a section of our propagating division in the greenhouse. These are seed flats in which are thousands of seedlings just ready for the first transplanting. This was an experiment upon germination. The right half was planted with seed which had been treated with boiling water.

Here is a section of cold frames where seedlings are handled. These plants are being removed from the greenhouse preparatory to their setting in the cold frame, or transplanting to the open field, as the case may be. Many of our plants are transferred from the greenhouse to cold frames, beginning the first of March. They can be safely transferred at that time and will withstand the usual hardening off process. Transplanting, of course, comes next and we use the machine shown on the screen. Only one man is used on the machine, since it has been found that one experienced man will accomplish as much and do it better than two.

This is a general view of one of our early breeding plots of belladonna. To the right you will notice plants with white spots on them. They are paper bags, protecting the flowers from cross-pollination. We are very much delighted with one strain recently isolated. Three years' testing has shown it to possess a very much higher percentage of alkaloid than the average type. Unfortunately, as I stated before, we do not always get the best combination of characters. It grows less vigorously and is more sensitive to soil and weather conditions.

This is a view of the harvesting of a belladonna crop. Cutting is done by hand and the entire plant is immediately removed to the drying shed. After partial curing, the leaves and stems are separated. We have grown belladonna strictly as an annual, starting about January and completing the harvest at the end of the season, taking out all the roots.

Henbane is probably more important this year than belladonna, but more difficult to grow. This is one of our early plantings. This planting was made in 1915 and represents an early stage of growth. Here is a later stage, showing the plants somewhat larger, and still another one where the plants have reached a very luxurious stage of growth. A midsummer shower on this plot, followed by a hot sun, converted the entire plot into one resembling a field treated with hot water, practically every plant in the plot being lost.

This is *Hyoscyamus muticus*. This group of plants, consisting of about two hundred, were transferred to the open ground during the month of May, and were all lost, probably on account of the cold, wet weather which followed. This, of course, is the tropical hyoscyamus from which atropine is obtained. It has proved very difficult to grow even under carefully controlled greenhouse conditions. Some few plants have been grown to the flowering stage, but none have so far produced seed. Attempts to cross it with *Hyoscyamus niger* have been unsuccessful.

THE CULTIVATION OF HENBANE.*

BY N. R. MUELLER.

During the past three years much attention has been given to the commercial growing of Solanaceous plants containing mydriatic alkaloids. Of course belladonna and stramonium have been produced in increasing quantities, but it is apparent that the cultivation of henbane offers several problems which differ materially from those encountered in the handling of either of the first mentioned crops.

Stramonium is successfully grown from seed sown direct to the field in spring, while belladonna has thus far been produced from transplanted seedlings. When an attempt is made to transplant henbane seedlings grown in a green-house or frame, the results are discouraging, since the plants seldom recover from the shock of transplanting, and when an occasional plant does survive, it remains stunted and puts on but little growth during the summer. It has been found that injury to the long tap root of the seedling is the cause of this loss which often exceeds 50 percent of the plants set out, hence this method of propagation is not practical on a large scale.

Since transplanting is not feasible, some experiments have been made at the Wisconsin Pharmaceutical Garden¹ to determine the practicability of sowing seed direct to the field. Biennial henbane seed sown in early December 1916, at Madison, Wis., began to come up about May 10, 1917, while some of the same seed sown April 21, 1917, came up May 16, 1917. It is to be noted that the spring sown seed came up only a week later than that sown in fall, and also that it presented a more uniform stand.

In selecting a field for henbane, it is advisable to get a level area comparatively free from weeds, because the slow germination of the seeds, and the low growing habit of the plants, at least until they attain a growth of several inches, makes hand weeding necessary, and this labor as well as that of cultivation is greatly increased in a weedy field. So far as soil is concerned a well drained fertile and friable sandy loam or silt loam gives the best results.

One pound of good henbane seed is sufficient for planting an acre in rows two feet apart. Henbane seed retains its viability several years provided it has been kept dry. Commercial seed which shows a fair percentage germination can be used; however, better results will be obtained from seed which has been collected for planting purposes. If possible, the germination of all drug-plant seeds should be tested before planting, since many ventures have met with failure mainly because poor seed was used. If sown by hand, the seed can be mixed with sand, and dropped into a shallow drill; however, more uniform planting will result if a small seeder is used. The seed should be checked so that one viable seed occurs in every four inches of the row, and due care must be taken to cover the seeds not deeper than about one-fourth of an inch. If necessary, cultivation between the rows to keep down the weeds can be carried on before the henbane plants appear, provided the rows are discernable or have been marked at the ends. Later the plants should be weeded and thinned to stand about four inches apart.

* Scientific Section, A. Ph. A., Indianapolis meeting, 1917.

¹ The Pharmaceutical Experiment Station, Department of Pharmacy, University of Wisconsin and Office of the Drug-Plant and Poisonous-Plant Investigations, Bureau of Plant Industry, U. S. Department of Agriculture, coöperating.

Insects, particularly the Colorado beetle or potato bug, have been perhaps the greatest factor in discouraging the growing of henbane. The potato bug apparently prefers henbane to any other plant in the same family. Spraying with Paris green and with lead arsenate have shown that the latter poison is most efficient. A dilute spray (1:1000) should be applied to the rows when the plants are about one to two inches tall. During the latter part of July when the ravages of the beetle are most severe, another light spray of lead arsenate is usually necessary. Two applications of the insecticide have been found sufficient to curtail the damage from this source. It is advisable to spray the plants several weeks before harvest, and it is necessary that at least one rain should wash the leaves before they are collected.

In order to ascertain whether any appreciable amount of lead arsenate was present on the leaves of sprayed plants, arsenic was tested for according to the method given in the U. S. P. IX. About 200 grammes of green leaves which had been sprayed ten days earlier, and had received one drenching rain, were collected. The surface of each leaf was thoroughly scrubbed with water. After concentrating the 200 Cc. of water used for washing, several tests were made and in each case the trace of arsenic found would amount to less than 0.002 Gm. in each kilo of dried henbane leaves. The arsenic contamination is, therefore, so small as to be negligible.

The crop of leaves should be cut in fall before frost, taken to the drying house and spread thinly either on the floor or in trays, depending upon the available drying facilities. A small amount of heat and a current of air hastens the drying process, and also preserves the green color of the leaves.

Comparative yields indicate that almost twice as much drug can be obtained from the first year's growth than from a similar area of second year plants.

Chemical assays of the leaves of the second year's growth biennial henbane showed a total of 0.07 percent of alkaloids, while leaves of the first year's growth grown from the same seed gave 0.067 percent of the alkaloids of hyoscyamus. It is evident from these assays that the activity of the drug is about the same whether collected the first or second year.

SYMPOSIUM ON DRUG CULTURE.

W. W. STOCKBERGER.

I availed myself of my opportunity as secretary to use that old principle that it is easier to get somebody else to do your work than to do it yourself, so instead of preparing and presenting a paper I suggested this symposium, and I trust that I shall not fail to be rewarded by having a number of those present deliver my paper for me.

The main thesis which I wish to bring to the attention of the Section has already been enunciated by our old friend Dr. J. U. Lloyd.¹ In his comments following the exhibition of the reel of pictures on drug cultivation you will remember that he, out of his years of wisdom and experience, recognized the importance of fully appreciating the resistance to be overcome in every enterprise. I am fully convinced that the commercial cultivation of drug plants at least is not a romantic adventure, but that it is a practical business proposition. It so happens, by virtue of the position which I occupy, that I learn much of what is going on in this country with respect to drug cultivation. What I wish to emphasize is this—That even among the men who are the leaders, or who ought to be the leaders in this subject, there is the most extreme

¹ These remarks have been omitted because they are in substance repeated by this speaker.

divergence of opinion as to what is and what ought to be done. We all recognize that we can not agree fully and completely, but I do not believe that there is any reason for the great difference of opinion with respect to this matter of drug cultivation, that exists even among the members of this Section; and what I wish to suggest for your consideration has already been foreshadowed by Dr. Lloyd when he said that he wished we might have a circular which would put this matter in concrete, crystallized form, so that uniform information could be sent out by all of us. Now that is the point that I wish we could reach to-day. We ought to agree on a definite general policy. Of course we may not all agree on details because each man wishes to have his own opinion; but the general policy toward drug cultivation I think should be agreed upon.

Now to illustrate: Either there is an opportunity for thousands of people in this country to make enormous profits with little or no work or else that opportunity does not exist. Now which way is it? That is one of the points upon which there is difference of opinion. The opinion has been expressed that we should encourage every individual who expresses an interest in the cultivation of drug plants to go into the business. Even though ninety-nine out of a hundred fail—so this opinion goes—the end justifies the means if one makes a success. Now that is a principle to which personally I am diametrically opposed, because I see no justification for lending our encouragement to ninety-nine failures, with the meagre hope of one success. Moreover, if there is any legitimate place for the future development of drug cultivation, and if we are to approach those ideals which have been so splendidly presented here this morning, according to which the products of drug cultivation will be gathered and handled under controlled conditions and properly tested with respect to their standard of excellence then we cannot afford to jeopardize the development of that side of this proposition by encouraging a large number of people to go into the business if they are going to fail, because that will bring the whole proposition into disrepute. And so it seems to me that this is another point upon which there should be no difference of opinion.

Another point upon which there is disagreement is the opportunity which exists for commercial drug growing. The thought came to me one day when riding on a train to be a little spectacular for once by presenting graphically the contrast between the opportunity for the American people in this enterprise of drug growing and their opportunities with staple crops. For the drug crops I chose belladonna and assumed that the entire requirement of this country could be grown on say, three hundred acres. I chose corn as the staple crop for comparison although I realized that when illustrated graphically, the line representing the acreage of corn would be very much longer than that for the acreage of belladonna. When I came to calculate the length of my two lines I found that if I used one thirty-second of an inch to represent the acreage of belladonna, the line representing the acreage of corn would run down the street for almost half a mile. Now this question of relativity is another one of the important things, it seems to me that we ought to appreciate more fully. The man who publishes a magazine article on drug growing and says to thousands of readers, "Here is an opportunity," may tell the truth, but he misses the important point. What may be an opportunity for a few individuals may be of no significance whatever when addressing the American people, among whom we number our farmers by the millions. Likewise the suggestion that \$4000.00 or \$5000.00 can be made from a few plants of belladonna or golden seal or ipecac in a back yard, or some such proposition as that, is misleading to say the least, but strange to say there are thousands of people who believe this fiction and straightway set out to secure material to plant, in the hope that they will obtain these great returns for their efforts.

Just a few weeks ago I sent out a circular letter to every person that I could learn of in this country who was growing belladonna, or who was supposed to be growing belladonna commercially. I am not at liberty to give a detailed abstract of the replies received, although I wish I could, for your edification. Suffice to say that out of a long list to whom I sent this inquiry not more than one percent reported that they had any degree of success at all. A very large number reported total failures, and as they had purchased belladonna seed with which to experiment at five dollars an ounce, they were naturally disappointed. Some of us receive hundreds of letters from people who are anxious to increase their income. They have read glowing stories about the wonderful returns from growing medicinal plants, and have invested five or more dollars in belladonna seed, although they possibly never grew any plants in their lives. Their faith would move mountains but it won't grow belladonna.

Another point upon which I think we should agree more closely concerns the marketing of the products of drug cultivation. Much of our talk regarding the commercial cultivation of drugs fails entirely to take into account the question of marketing. It is all well enough to say to the farmer, "grow corn, or cotton, or wheat," because if he gets a crop there is always a market right at hand. But when he grows belladonna how is he going to sell it? He has been told that the druggist or the manufacturing pharmacist will buy it. But his market will be in a distant city, and he will have to advance the freight and then accept whatever price the consignee may choose to pay. Few of these people know how to prepare their drugs to meet the usual market requirements, and to the problem of disposal ninety-five percent of those who are thinking about this enterprise may never have given any thought at all. They assume because staple crops have a ready market that it will also be easy to market their drug products. I do not wish to discredit the worthy motives which actuate many persons who are urging drug growing. All that I ask is that we see both sides of the question; tell the people the truth in the matter and point out the difficulties as well as the attractive side of the proposition.

There has been, as some of you know, a movement on foot for nearly a year to form a National Drug Growers' Association. It is recognized that there is need for those interested in drug growing to get together and adopt a uniform policy. Such an association may be the means by which that may be brought about. I think perhaps it is a question for debate whether we wish at this time to attempt anything so ambitious as a National Association of Drug Growers. I believe that we can do much as an association either through the Scientific Section, or better, a committee of this Section, composed of men who are interested in the cultivation of medicinal plants. Such a committee could formulate a definite policy and secure the necessary publicity for the same. It seems to me that this is one of the questions we should think about very seriously today.

As most of you know, I am very much interested in the subject of medicinal drug gardens. I believe in these gardens thoroughly, and am fully convinced that they are a wonderful educational stimulus. I shall not try to name all the recommendations they have, since I talked upon this subject at the Atlantic City meeting last year. Since then a number of other gardens have been established and some of the older ones have been much extended. We need to encourage these gardens for their educational value, but it appears that the real function of the School of Pharmacy drug garden is misunderstood by a large part of the public at large, and is not looked upon as an aid to education, as a means of stimulating research and furnishing materials for use in solving many of the problems of *materia medica*, but, on the contrary, they are believed to be established for the purpose of helping people to make money. The commercialism which seems to act as a colored screen before the eyes of some who look at this phase of drug growing should be swept aside and our educational drug gardens viewed in the white light of reality.

Our drug gardens now form a recognized asset of pharmaceutical education and their beneficial effects are very apparent at a number of our educational institutions, but lack of unity of purpose or lack of agreement as to the scope and function of these gardens will sooner or later bring us all into disrepute with the public.

In this rambling way I hope I may have supplemented somewhat the thesis laid down by our venerable colleague, Dr. Lloyd, when he said we ought to crystallize the facts about drug growing in such a way that we can all tell the same story.

EDWARD KREMERS

I want to second most heartily the suggestions made by Dr. Stockberger. I could weary you with a long list of special illustrations supplementing his excellent remarks, but I shall not do so. I want to emphasize, however, that if we are not boosters we need not necessarily be knockers. Dr. Stockberger certainly is not a pessimist on the subject of the cultivation of medicinal plants. Neither am I. But to hold out hopes which will lead to nothing, but which will injure the entire scheme of the cultivation of medicinal plants in this country, is all wrong.

I need but remind you of the hopes that were held out to the farmers of this country for the production of industrial alcohol. According to the newspaper accounts it was to be possible for any farmer to go to his barnyard and pick up the refuse that the cattle would not touch, and convert that into alcohol with which to illumine his house, and to run his farm machinery—also his Ford. You know that nothing has come of that, and it seems to me we have occasion to

congratulate our country that the person who is looking after the cultivation of medicinal plants at Washington is not guilty of holding out any false hopes to the people.

The subject is so large that it is impossible for me to touch on many phases thereof, but before touching on a single phase let me call your attention to the degree of specialization which has developed in the American Pharmaceutical Association in the last twenty-five years. The growth of our Section is an indication of that degree of specialization. There was a time when the members of the American Pharmaceutical Association came together and all talked about the same subjects. There is no thought of doing that to-day. Now we are confronted with the feasibility of either establishing a new section on the cultivation of medicinal plants, or organizing a committee within this Section that is to look after the cultivation of medicinal plants. The problems that confront us in the cultivation of medicinal plants are so numerous and so special that even the scientists of the American Pharmaceutical Association alone may not hope to cope with them.

I want to emphasize the statement made by Mr. Fuller, namely the need of cooperation. At the large universities the men who are interested in the same lines of work, say chemistry, naturally try to get together for purposes of conference. That is very important. And yet when I think of those who are most helpful to us in the cultivation of medicinal plants and indeed in all of our problems in the pharmaceutical experiment station, I do not necessarily think of the members of our local chemical association who are working in the same building or other buildings on the campus; I do not even necessarily think of some of the members in the school of medicine but the colleagues of whom I think first of all are the professor of experimental plant breeding, of the professor of entomology, of the professors in the horticultural department and those in the plant pathology department. All of these men are cooperating with us and giving us most helpful assistance. Take, for instance, the subject of plant breeding. We have been requested by the Office of Drug-Plant and Poisonous-Plant Investigation in Washington to make a special study of stramonium. We began by studying the literature on the subject, and several years ago we issued a bulletin in which we called attention to all of the previous work as well as our own. We issued that bulletin for the reason that we wanted to put the tombstone, as it were, on all that had been done before, and we started out anew. It was the professor of experimental breeding who with his assistants came to the rescue. They are cooperating with us to-day.

Something has been said about the quality of drugs. Take for instance stramonium. The U. S. P. requirements, I think, came down from 0.35 to 0.25 in the alkaloidal requirements—not the present revision, but the previous revision—because the drug of 0.35 alkaloidal strength could not be obtained. It was a matter of chance that we obtained a plant containing 0.45, or, say, 0.40—whatever figures I select here make no differences; the actual figures on record would not be any more true than any figures I put down here (illustrating on blackboard). We took the seeds of that plant in the hope to get pedigreed material. Suppose we have a thousand seeds from one plant. We sow these seeds, we thin out our plants and we have a hundred plants left. Of these hundred plants we select twenty plants for seed, for purposes of propagation, and we test the leaves of those selected plants. We then find, for instance, that one plant assays 0.41, the next one 0.37, the next one 0.32, the next one less, whatever it is. We find that most of the plants we have assay low, 0.09, or something like that (illustrating). Now first of all the plant from which we have selected seed yielding a drug with 0.40 alkaloid is a composite, with strains of ancestry going back we know not how far. Now what we do is to eliminate some of those strains, and we take, for instance, this plant here with 0.41 percent alkaloid content in its leaf (illustrating). The next year it is again a matter of chance what we get. Out of a thousand seeds we will get possibly a hundred plants. Out of the hundred plants we select possibly twenty for assay.

We may not get a single one as high as 0.5, but again we may take the highest, let it be 0.3 and we propagate. In doing this we eliminate certain ancestries as it were more and more. Whether we can carry the process to a successful conclusion is another question. But I do not want to pose as an expert on the Mendelian law of plant breeding. I simply wish to point out to you how the experimental plant breeder, whether he is trained along plant or animal lines, is helpful to us, and how we, the chemists, have to cooperate with him in connection with our assays in finding out the strains that we want.

Let us next take up the subject of cultivation. I was very glad that you had several illustrations of orchard cultivation illustrated to you. I am not going to dwell on that and how that should be conducted.

Another important matter that might be spoken of is the cultivation of *Monarda*. After a number of failures we seem to have hit upon the right plan. Under some conditions it will not germinate. However, Prof. Beal demonstrated that the same seeds with which we have been experimenting, develop out in the open in Florida without any cover crop, indeed under conditions, as he told me, that in our latitude would have buried the seed forever. Hence it may be that under other conditions more favorable *Monarda* may be raised more readily than with us in Wisconsin. Of the several cover crops that we have tried out, winter rye has been most successful. Now after the rye has been harvested, the plants are three or four inches high, thousands of them, on a small piece of ground.

Incidentally you may be interested to know that in connection with the rye cover crop we inoculated the rye field with ergot, and we obtained a very nice crop of this fungus. However, we did not harvest it, not because we did not want to, but because our inexperience with both rye and ergot caused us to lose the entire crop. I thought the rye was not quite mature and wanted to wait until it was mature. So one morning when I came out to the field, with a high wind blowing, the sclerotia of the ergot were being blown off, and by 4.00 o'clock in the afternoon not a single sclerotium was left. But although the patient died the experiment was a success.

Attention has been called to the cultivation of henbane and the difficulties associated therewith. You have been told that the cultivation out in the open has been successful. The additional point that I wish to make in that connection is this: When you sow henbane out in the open you naturally sow many more seeds than you expect plants to harvest. As a matter of fact we have to thin out the plants. Now instead of going into the field with a hoe and cutting out those plants and letting them wilt, we have tried the thinning out by hand, and we are raising young henbane plants as a by-product as it were. The waste plants are not thrown away. Neither are our excess *digitalis* plants thrown away. Whether they will reveal the same efficiency as the mature plant, I do not yet know. We have here another of those numerous tricks of the trade that you have to learn when you go into the cultivation on an economic scale.

I enjoyed very much indeed the films from the Washington Experiment Station by Mr. Fuller, but I want to caution you against one thing. Certainly if the temperature, as he states, was 120 degrees one day, the workers do not keep up that rate of speed in picking leaves that was indicated on the films. That is a very important economic problem. We have found in picking choice *belladonna* leaves that the picking is half of the expense.

So when it comes to certain medicinal plants and the drugs to be obtained therefrom, we have to get away from many an old pharmacopoeia notion. I remember it was not many decades ago that the U. S. Pharmacopoeia defined oil of peppermint as the oil distilled from peppermint. Then when you looked up what peppermint was in the Pharmacopoeia you found it defined it as such and such a drug. Well, not a pound of peppermint oil was distilled in this country or anywhere else according to that definition. Mr. Allen of London once complained to me that he was trying to distil cinnamon oil from Ceylon cinnamon, as demanded by the British Pharmacopoeia, and that the oil cost him \$20.00 or \$25.00 a pound or more, to say nothing about the profit. Now some of those ideas we have to get away from and the sooner the Pharmacopoeia gets away from some of them the better.

In the case of *digitalis* we have had the difficulty that just before harvesting we might have a heavy rain. Our soil contains a very fine clay which is thrown up against the hairy surface of the *digitalis* leaves, and it is extremely difficult to remove it. You might brush every leaf separately and not remove every particle of clay. You can readily see what such a *digitalis* leaf would cost if you tried to make it true to the Pharmacopoeia. *Digitalis* leaf should not contain more than ten percent of ash, but the choice *digitalis* leaf which we have raised in our garden contained as much as twenty-five percent of ash. That is, the apparent ash content was such. However, only ten percent of this were really ash; the remaining 15 percent were clay. So in supplying an eastern hospital with a No. 20 powder of *digitalis*, we examined the powder as we obtained it by means of a set of analytical sieves. From a kilo we got about one-half kilo of No. 20 powder. We got, I have forgotten how many grammes, of 30, 40, 50 and 60 powder up

to 100. Whereas our No. 20 powder contained 10 percent—that is, represented the drug with its true ash content—the finer powders contained an increasing amount of ash until the finest powder which consisted of 75 percent clay. Now that is a simple mechanical means of improving a drug. Whether, as our friend, the late Martin Wilbert, suggested, the clay might have an occluding effect on the active constituents as well as act merely as a mechanical diluent, has not been determined. That is a problem that we shall have to work on.

Just one other word and I will stop. So far I have spoken simply about the production of the plants themselves and drugs from the plant. When it comes to the production of medicinal or pharmaceutical chemicals from the plants, we have other problems to contend with. Let me take the illustration of the *Monarda* again. *Monarda* usually yields about five-tenths of one percent of volatile oil. A ton of green material therefore will yield about ten pounds of oil. You can therefore imagine how large an area you will require to supply the United States, or simply the Rockefeller foundation with the amount of thymol that it uses in the hook worm campaign. Now that oil assays 50 percent of thymol, according to the assay method. A member of our Association was surprised this morning when I informed him that last year we sent out over 100 pounds of Wisconsin thymol. More than that, he was surprised to learn that none of it had been rejected, but that the purchasers accepted it as A No. 1 thymol. However, we never succeeded in getting the 50 percent of thymol out of that oil. Working with hundreds of pounds we accumulated enough mother liquid from which, by very careful manipulation last winter, using winter temperature, we removed practically all of the thymol. Such effort would not pay commercially, but we wanted to find out what was the cause of our deficiency in manufacture as compared with the assay. We were rewarded by finding considerable carvacrol, an isomer of thymol, which however does not crystallize at room temperature. Here you see we have an illustration of how careful we must go ahead. You may sit down and on the strength of the assay figure out with scientific accuracy, as you think, just how many acres of *Monarda* you need in order to supply a certain amount of thymol, but when it comes to the practical economic problem, the production of the actual thymol, you may find that you get left.

H. C. FULLER.

There is one thing that seems to be emphasized, and that is the unanimity of opinion and apparently the spirit of coöperation that is manifest. And coöperation can do a great deal.

Mr. Miller's statement about cannabis is specially interesting. He can grow cannabis and allow it to come to maturity and go to seed. He can use it in his own drugs and it is all right, and that is perfectly proper, but if we, as a commercial enterprise, attempt to grow cannabis that way, allow it to come to maturity, let it seed, and try to dispose of it, nobody would buy it from us. In fact, we would be liable to have our shipments seized by the United States Government, because they would not comply with the Pharmacopoeia as regards certain characteristics. The drug may test up to the proper physiological strength but it has too many seeds.

Another thing, in culling out our male plants during the season, I have had them saved from time to time; had them examined by assay, the same as I have done with the female plants, and by simply labeling it "cannabis" the pharmacologist reports back that the male tops are better than the U. S. P. and the female tops are equal to the U. S. P. But I can not sell the male tops for cannabis. Nobody will buy them. Now that is just one instance that touches those of us who are interested seriously in drug growing—and I am really optimistic regarding drug growing if it is properly done. I believe coöperation can do a great deal, but there are many other problems that confront us, and ought to be very seriously considered. There is the question of tariff, the question of the attitude of certain bodies antagonistic to botanical drugs which are used in large quantities in certain medicinals, etc. I am going to make a motion that a committee be appointed from this Section, looking to obtaining closer unanimity of opinion and presentation of information regarding this very important problem, to be a permanent committee composed of sufficient members to be representative, but not too many members to be cumbersome, to handle these various problems which have been presented today so ably by the different speakers.¹

¹ See December issue, pp. 1097-98, also p. 860. October number, 1917.

R. A. LYMAN.

I want to assure Mr. Fuller that there is in this room a spirit of coöperation, but I can not say that there is a spirit of unanimity. I am going to take just a few minutes of your time to state the position of the educational garden, which I represent.

I also want to call the attention of Mr. Fuller to this fact: He made the statement that it took a botanist to grow good drug plants. In my institution we have a young Englishman who is neither a botanist nor a scientist, and yet he can make things grow like nobody else has ever been able to make them grow.

I am interested in this matter chiefly for this reason, that drug plant cultivation is full of interesting problems, and it furnishes, as I see it, one of the finest avenues to interest young men of brains to enter the profession of pharmacy, and I do not propose to have anybody take that advantage away from me. I recognize the position of the educational garden. It is primarily for the purpose, to begin with, of helping to teach the students the subject of pharmacognosy. It is a laboratory; it has made a living subject out of pharmacognosy and I do not know why it is not perfectly proper for a great educational institution to attack these problems. For my part I do not propose to permit the Department of Agriculture of Nebraska to concern itself with the great problems of agriculture in our state, and not have the opportunity, that my own college of pharmacy in my own state should have, of rendering service to the druggists of Nebraska.

This is an educational garden; it must become a research garden. Just for example, I do not know why I should not be permitted next year to interest myself and my students in the following economic pharmaceutical problems: I have discovered this year that when henbane and potatoes grow side by side, the potato bug leaves the potato every time for the henbane. We in Nebraska raise millions of bushels of potatoes. The insecticides and the labor required for their application costs the farmers of Nebraska thousands of dollars. I do not know of any reason why I shall not next year, as a problem of my institution, have my students work upon an acre of potatoes with a row of henbane around it, and determine the cost of production of that acre of potatoes compared with another acre of potatoes that is not surrounded by henbane. If the potato bugs will leave those potatoes and go to that henbane, the student can apply insecticides to that row of henbane, at much less expense of material and labor. That is my problem.

Now I appreciate the position of everybody who takes the opposite view, that we should not encourage the cultivation of drugs in the way it has been encouraged. I rather admire Dr. Stockberger for taking the position that he has in discouraging the venture without the proper knowledge, because that has saved a lot of people from financial loss. But I must determine what I shall do in the State of Nebraska. None of these men in the Department of Agriculture or any of these other men in gardens over the country can tell me what I can do in Nebraska, because they have told me I could not raise belladonna and I could not raise digitalis, and the very things they told me I could not do, I set out to do and I did it. If anybody wants to stimulate me to get into a particular field, just let them tell me I can't do it.

I have found that young men have become interested, from this garden work, in the growing of drug plants, and every year as these young men go out, some of them graduates and others first year men and second year men, they say, "Dr. Lyman, can I have a few digitalis plants, a few belladonna plants, a few of golden seal, to start in my garden?" I always say yes, and I give them to them, and they take them out and start them. Most of them fail the first year and they come back to me and say, "My plants were no good," and I say "Well, here are my plants," and we talk the matter over and we find out what the difficulty is. Of course, sometimes they have simply stuck them in the ground and thought they would grow like potatoes—and they won't—and so they have tried again, and as the years have gone by I have found these men in different parts of the state growing their own little garden. Now it is of no commercial importance to those fellows, but they enjoy it. And, in addition to that, the people of that community, every one of them, I have found are interested in that young man, because he has got ideas that other people have not, and he is the coming druggist of that locality, and it is the best advertising proposition that was ever put before a community for a particular druggist; and I do not think that the people of Nebraska will lose any money because of the fact that this policy has been conducted in the University. From the efforts of these young men the people

of a community learn that the growing of drug plants is a work requiring endless labor and will undertake no foolish experiments. They learn without expense to themselves that the growing of drug plants does not mean an easy road to a fortune. Two years ago a freshman came to me in the spring and said, "Dr. Lyman, over here in Oak Creek Valley I and another freshman have rented 320 acres of land to raise drug plants. Now I have come to you to see what we shall plant." I said, "You come with me, young man," and out in the garden we went; and when we got through, he said, "Well, it isn't too late to plant corn."

J. U. LLOYD.

It seems to me one feature has been left out, and I think Dr. Stockberger will agree with me that it lies with him to utilize this for the advantage of the American people in the cultivation of drugs. At the meeting of the American Pharmaceutical Association in Kansas City, Mr. J. C. Huber of Fond-du-Lac, Wisconsin, the first man that tried to raise ginseng in America, came to me, I was chairman of the Committee on Papers and Queries, and said, "Professor, I am going to attempt raising ginseng." Now listen, we had depended upon senega from West Virginia, from the mountains of that state, and we had been getting little spindling plants the size of a knitting needle ever since America was discovered, and two years before that they found senega in Wisconsin with tops the size of your fist nearly, so large that we questioned whether it was senega or not. I said to Mr. Huber, "why don't you raise senega? You know senega will grow in Wisconsin; why concern yourself with the growing of ginseng that is native to the forests of Kentucky and Virginia?" Well, he went ahead and failed on ginseng when he could have succeeded with senega. On the old farm in Kentucky there has not been a crop of hemp raised for seventy-five years, and they can't kill it. Every fence corner on the place comes up with hemp. It grows naturally down there; it can be raised elsewhere, but you can not help raise it in Kentucky if you get a start. Out in Washington they raise digitalis, and it is best on the hillside. It has become a weed, and a pest to the farmers on the hillsides of Washington. How can a grower elsewhere compete with that digitalis? When they write to Dr. Stockberger from different parts of the country, he can say to the people in the South, "Yes, you can raise camphor; you can raise so and so down South, but do not trouble about drug plants that grow best in the North." Locate the part of the country where the plants will or do grow, but do not try to raise plants where they do not want to grow. To study the parts of the country where these drugs can best be used and where they will grow naturally will be a great help. I believe that is one of the opportunities in the direction of raising drugs, and there will be found a place in the United States where they can raise henbane but we must find the best locality. Mr. Fuller is the man who can make a success of drug growing. Manufacturers can hire trained men to go to the field, and keep an account of the expense, and probably supply themselves, and be sure of a supply for years to come. But Mr. Fuller, as I understand it, is in the commercial side of the business and he will make a success of it. He is the man who may sometime have a digitalis field out in the State of Washington, a senega field in Wisconsin and a hemp field in Kentucky; just as cannors locate their different plants in the sections of the country best suited for growing their supplies.

To this I will add that when I entered the room at the meeting of the American Pharmaceutical Association (1888), in Detroit, Dr. Charles Rice took me by the arm and said: "Lloyd, I want to show you something that is of exceptional interest." He took me to the part of the Exhibition Display, and introduced me to Mr. A. M. Todd, of Ottawa, saying: "Lloyd, I want you to study this peppermint display. Mr. Todd is on the right track. He will make a success of peppermint growing, thus giving to America another home production, improved by cultivation." For several successive years thereafter, Mr. Todd corresponded with me on the subject of the peppermint problem, sent me specimens of the oil, as well as of the menthol obtained therefrom, finally making a magnificent success of the peppermint industry. Now to the text. If these experiments had been made in an inhospitable country, soil and climate, utter failure would have resulted. A magnificent opportunity lies before America, by reason of the fact that we have in America every climate, soil and condition necessary for the introduction of all that America needs;—mountain, valley, rich woodland and desert are at our command. And, all America will profit by such wise guidance as Dr. Stockberger offers and Dr. Fuller supports

L. E. SAYRE.

I have been obliged to depend upon the United States Government and upon the gentlemen who have interested themselves in raising medicinal plants, in order to get authentic material for experimental work, and I want to say one of the best things which the United States Government has done with regard to that has been to stimulate an interest in this subject and to give us, who are in the educational institutions, material which we can operate with.

Do not be discouraged if ninety-nine percent are failures. I heard a paper read by one of the best business men in the country the other day in which he said that from seventy-five to ninety percent of the business men were failures, and he proved that by statistics. Nevertheless, do not be discouraged. I advised a young man to raise golden seal some five years ago, and to-day on a half-acre farm he is making two thousand dollars a year.

W. W. STOCKBERGER.

I wish to say one more word, I think we must protect from the results of their ignorance the impecunious man or woman who can not afford to invest even five dollars in a small quantity of seed and then get nothing from it. On the other hand, it is the duty of the educational institutions to carry out experimental work in their drug gardens since the facts secured will ultimately have great value for the people in the locality where the garden is located, and thus a double purpose will have been accomplished. I should like to see a great big drug garden in connection with every School of Pharmacy, and to act on Dr. Lloyd's suggestion and begin to work out individual problems. Nobody will try to rob you, Dr. Lyman, of any part of the field of work which you are so splendidly developing and I must say that no word that I have heard for a long time sounds so good to me as Dr. Lyman's statement that the drug garden is the problem of the School of Pharmacy.

WAR EMERGENCY FORMULAS.

Under above caption F. A. Upsher Smith presents, in the *Northwestern Druggist* for February, the timely subject of displacing glycerin and sugar in many of the preparations of the U. S. P. and N. F., and suggests work of investigation relating thereto. The statement made, "that allowing 50 pounds of glycerin and 500 pounds of sugar for each of the 40,000 drug stores per year, we arrive at an estimated yearly consumption of two million pounds of glycerin and twenty million pounds of sugar," is sufficient for emphasizing the possibility of conservation. In the January issue of the *JOURNAL OF THE A. PH. A.* will be found a related article by Prof. Curt P. Wimmer.

Mr. Smith has brought the matter to the attention of the U. S. P. Revision Committee and the N. F. Committee. A War Emergency Addendum to the *British Pharmaceutical Codex* has been published, containing formulas for the preparations in which glycerin and sugar have wholly or in part been displaced. There are many preparations of the U. S. P. and N. F. in which sugar and glycerin are employed because under normal conditions, no base, solvent or adjuvant is better or more economical; war-time conditions have changed this phase, and the proposition is now presented from the view point of conservation, provided the medicinal value of the active constituents is maintained.

Unfortunately, no one can foretell the duration of the war. France and Italy, before the war, were nearly self-supporting relative to sugar; the United States, Canada and England were importing countries. It has been determined that during this year the United States must cut down its consumption by 15 percent. Relative to glycerin, the situation is perhaps more serious. We lacked in preparedness for the war; we now know that if the war continues the shortage of the two important products mentioned will become more pronounced and presents the timely question of preparation for the emergency. There are question that will be involved in the proposition, namely, official recognition of the *succedanea*, and standards for the same.

The subject should be discussed in Branch meetings, by local associations, and in joint meetings of physicians and pharmacists. Care should be used in selecting substitutes so that no shortage will be created of these products, as this would only be a shift instead of relief.

SOLVENTS IN PHARMACY.*

(Continuation of "Precipitates in Fluid Extracts," 1885.)

(The paper was written in 1885, see Introduction, p. 940, November 1917.)

BY JOHN URI LLOYD.

PART II.

The solvents considered in this series of experiments are **Solvents Considered.** (excluding acids and alkalies) those that appear as being of possible use in plant pharmacy, as solvents or excluders, either alone or mixed. They are numbered herein, successively, and may, for our present purpose, be most rationally classified by group solvent relationships. Three classes, then, result (Table I), as follows:—

TABLE I.

| | |
|----------------------------------------------------|-----------------|
| 1st, Glycerin, | |
| 2nd, Water, | |
| 3rd, Alcohol (U. S. P. 1880), ¹ | <i>Class 1.</i> |
| 4th, Methyl Alcohol. | |
| 5th, Acetone, | |
| 6th, Chloroform, | |
| 7th, Amylic Alcohol, | <i>Class 2.</i> |
| 8th, Acetic Ether, | |
| 9th, Sulphuric Ether (U. S. P. 1880). ¹ | |
| 10th, Benzol, | |
| 11th, Carbon Disulphide, | |
| 12th, Benzin, | <i>Class 3.</i> |
| 13th, Turpentine Oil (rectified), | |
| 14th, Liquid Petrolatum. | |

Class 1—Glycerin, Water, Alcohol and Methyl Alcohol. The members of Class 1 mix² with each other in all proportions, regardless of order of mixing them. It is impossible to make any combination that is not transparent. Were it not for the erratic acetone of Class 2, which refuses to mix with glycerin, this substance (acetone) might also be included in Class 1, because acetone mixes freely with the other members of this class. The members of Class 1, when pure, are either odorless or possessed of no very marked odor. Excepting glycerin, they evaporate readily and are easily distilled.

Class 2—Acetone, Chloroform, Amylic Alcohol, Acetic Ether and Sulphuric Ether. The members of Class 2 mix with each other in all proportions. It is impossible to make any combination of any or all of these substances, that is not transparent. The members of this group are all volatile, and excepting amylic alcohol, which boils at about 270° F., may be easily distilled. They are all possessed

* Continued from p. 949, November 1917. Thanks of the author are extended to Miss Eda Van Guelpen for drawings of cuts presented, to Miss Margaret Stewart for editorial oversight and to Miss Anna Longstreet for typewriting care.

¹ It is essential that liquids in exact accord with those used in the experimentation originally instituted be employed. Hence, neither Alcohol U. S. P. nor Ether U. S. P. 1910 is now admissible. (J. U. L., 1917.)

² Where the term *mix* or *miscible* is employed, perfect solution is to be understood. All these liquids may be mechanically mixed by agitation or emulsifying processes.

of marked odors, and these odors, beginning with acetone which is less decided than the others, are successively pleasant, but upon reaching sulphuric ether they become unpleasant, that of amylic alcohol being disagreeable.

Class 3—Benzol, Carbon Disulphide, Benzin, Turpentine Oil and Liquid Petrolatum. The members of Class 3 mix with each other in all proportions. They are, excepting liquid petrolatum, volatile at ordinary temperatures, some of them being very volatile. Excepting benzol and liquid petrolatum, they are all possessed of disagreeable odors.

**General Remarks
on the Three Classes.**

Considering these fourteen liquids in the order given, it is found that between the extremes no solvent affinity whatever exists, but as we progress down or up the series, affiliation increases.

Thus, glycerin, which mixes clear with any member of Class 1, is practically indifferent to all of Class 2, and will not mix freely with any member or combination that may be made of Class 3.

Water is indifferent to all the members of Class 3. Of Class 2 it mixes in all proportions with acetone, takes up of sulphuric ether largely, and is indifferent to the other members.

Alcohol mixes freely with all the members of Classes 1 and 2, and is miscible in varying degrees with all but liquid petrolatum of Class 3.

Methyl alcohol mixes freely with all the members of Class 2, with one member (benzol) of Class 3, and is very friendly towards the other members of the third class. Indeed, the only practically indifferent liquid of the entire list to methyl alcohol is liquid petrolatum.³

Thus it is seen that a progressive relationship seems to exist between the members of Class 1, increasingly for certain members of the other classes, as we progress from glycerin to methyl alcohol.

When we step into Class 2, we find that the first member, acetone, is remarkable in that it mixes freely with all the liquids of the entire list excepting the extremes, glycerin and liquid petrolatum. It has no other incompatible.

Next, chloroform is possessed of fully as marked affinities, exclusive of the first two members of Class 1, water and glycerin, with which, however, it very slightly affiliates. Chloroform and amylic alcohol mark the central feature in the list, for from these two as we progress towards the extremes we find increasing antagonisms. Amylic alcohol has practically the solvent relationships of chloroform. It mixes partially with liquid petrolatum, and freely with all the other liquids excepting water and glycerin, in each of which it is sparingly soluble. Begin with amylic alcohol and pass to Class 3. Adding successively the same bulk of each liquid, and shaking after each addition, the liquid remains transparent to, and including, liquid petrolatum. Pass now in the other direction and add to the foregoing mixture each liquid, successively, to the water. Constant transparency results, but the water immediately decomposes the mixture, the line of division being remarkably changed from what might be anticipated. (See Process of Establishing Solubilities.)

³ In these experiments equal amounts are shaken together. Liquid petrolatum and methyl alcohol separate, leaving the surface film between them about where it would be in case neither dissolved the other. See "*Process of Establishing Solubilities.*"

Acetic ether will not, in equal amounts, mix with any member of Class 3, and with only two of Class 1, water and glycerin being with it immiscible.

Sulphuric ether, U. S. P. 1880, mixes freely with all members of Class 3 excepting liquid petrolatum.⁴

Passing now to Class 3 we strike first benzol, the most cosmopolitan member of that class. It affiliates⁵ with two members of Class 1 (alcohol and methyl alcohol), with all but one member of Class 2 (acetic ether), with which it unites one to two parts. In this respect it is an exception, for any other member of the entire list that freely dissolves sulphuric ether, will also dissolve acetic ether freely. It refuses to unite with water and glycerin in any proportion, thus indicating the relationship that, in our present study, places it in Class 3.

FIG. 4.

A, A—Carbon Disulphide.
B—Glycerin. Position assumed on shaking, Fig. 5. Note meniscus, lower A, reverse of Glycerin (A), Fig. 5.

FIG. 5.

A—Glycerin.
B—Carbon Disulphide. Position assumed when carbon disulphide is poured carefully on the surface of the glycerin, narrow container.

The second member of Class 3, carbon disulphide, mixes freely with all but one member (acetic ether) of Class 2, and mixes with only one (alcohol) of Class 1.⁶

⁴ This is important,—indeed, one thought of the writer is the opportunity of establishing standards of purity by behavior of mixed liquids, a very entrancing research. For example, the separation of sulphuric ether (U. S. P. 1880) from liquid petrolatum, is due to the water contained in the U. S. P. ether, 1880. Water-free (Squibb's Anhydrous) ether mixes with all the liquids of Class 3. In order to parallel the experiments (1885) in which sulphuric ether U. S. P. 1880, specific gravity 0.750, was used, ether of the same strength must be employed. This is a very delicate test for water in ether. J. U. L. 1917.

⁵ Mixes in equal amounts, by measure.

⁶ In this connection, the contact meniscus of three of these,—methyl alcohol, water and glycerin—is fruitful as regards their curvatures, these distinctions being part of my study in connection with capillarity. The mixture of carbon disulphide and glycerin is remarkable because the lighter liquid, glycerin, s. g. 1.250, if the cylinder be small in diameter rests beneath the heavier, CS_2 , s. g. 1.268, when the glycerin is added first (see figures 4 and 5). The cause of this phenomenon, a most interesting study and very fruitful, in its relationships, is studied in another place (not yet published).

Benzin, turpentine and liquid petrolatum stand practically together in their affinities. None will mix with any member of the first class. All mix freely with the three first members of the second class,—acetone, chloroform and amylie alcohol. They all dissolve in acetic and sulphuric ether, but vary somewhat as regards proportion. Liquid petrolatum is separated from the others of this (3rd) class, in that it is odorless, and is not volatile at ordinary temperatures. Thus liquid petrolatum, terminating Class 3, stands isolated as does glycerin in heading Class 1. In all respects these two liquids are so antagonistic that it may be said that from the angle we now consider them, they are the antithesis of each other.

Solutions of Solvents and Mixtures of Neutral Solvents.

We are now led to an unmentioned and yet very well-known phase of the act of solution that confronts us when we consider the separates of the three classes.

Mix any two miscible solvents, *e. g.*, alcohol and water, and, as has been stated, the solvent action of the resultant liquid is different from that of the original. For example, equal parts of water and alcohol, mixed, will not dissolve as much salt and shellac as would either alone (water, the salt,—and alcohol, shellac). Add to a mixture of water and alcohol, successively, other affiliating liquids, and with each addition the solvent power of the product is altered. Change the proportions of the ingredients and, it becomes possible to make a solution of one liquid in another and then, by adding a third liquid, to throw more or less of one or the other constituent (perhaps both) of the first mixture out of solution. In other words, to precipitate it.⁷ In like manner other liquids may be added, and thus produce precipitate after precipitate, successively, all perhaps finally redissolving, when the strain is broken by the addition of an affiliating liquid. Each new mixture becomes a new menstruum, each new menstruum is a solvent having distinct affiliating qualities, as is shown by the disappearance or increase of the successive precipitates, and also indicated by the shifting of the line of demarcation as each liquid is added. These qualities present great opportunities in manipulative pharmacy.

Mediators for Uniting Immiscible Solvents.

In mixing neutral solvents we are led to results that occasionally seem to conflict with our theories, if the characters of separated ingredients, as aforementioned are alone taken into account. It is possible to make combinations that will enable liquids of opposite characters to coalesce. We can, for example, by using a mediator, unite some proportion of any member of Class 1 with any member of Class 3.

Thus, if two parts of acetone be mixed with two parts of glycerin, the mixture will at once separate into two layers, about equally divided. Add now one part of methyl alcohol and agitate;—the liquid immediately becomes transparent, forming a single menstruum. The methyl alcohol acts as a mediator, affiliating the three into one, which, however, has a different solvent action from any of its constituents.

Again. Mix two parts of acetic ether with two parts of water, and they will separate. Add now one part of alcohol, and the two layers immediately unite, the

⁷ We have in previous articles (*Proc. Am. Pharm. Assoc.*, 1870-1885) endeavored to make it plain that a precipitate, or better, *separate*, may be either a solid or a liquid, and either heavier or lighter than the bulk of the liquid.

three forming a transparent solution. Let us, with this thought, introduce Table II, formulated as follows:—

Begin with the last member (No. 14) of the list, liquid petrolatum, and add successively two parts of each that precedes, agitating after each addition. They will mix transparent until No. 9 is reached (sulphuric ether), when the solution becomes milky, and remains milky after No. 8 (acetic ether) is added, but it again becomes transparent upon the addition of No. 7 (amylic alcohol), remaining transparent therefrom to and including No. 3 (alcohol). It will be seen that an incompatible appears when we add No. 9 (sulphuric ether):—⁸

TABLE II.

| |
|-------------------------------------------|
| Liquid Petrolatum, |
| Turpentine Oil (rectified), |
| Benzin, |
| Carbon Disulphide, |
| Benzol, |
| Sulphuric Ether (U. S. P. 1880) (clouds), |
| Acetic Ether (clouds), |
| Amylic Alcohol (clears), |
| Chloroform, |
| Acetone, |
| Methyl Alcohol, |
| Alcohol (U. S. P. 1880), |
| Water (separates into two sections). |

Precipitation or cloudiness may be avoided by merely altering the order of mixing, as follows (Table III), shaking with each addition:⁹

TABLE III.

| |
|--------------------------|
| 2 Cc. Liquid Petrolatum, |
| 2 Cc. Turpentine, |
| 2 Cc. Benzin, |
| 2 Cc. Carbon Disulphide, |
| 2 Cc. Benzol, |
| 2 Cc. Amylic Alcohol, |
| 2 Cc. Chloroform, |
| 2 Cc. Acetone, |
| 2 Cc. Methyl Alcohol, |
| 2 Cc. Sulphuric Ether, |
| 2 Cc. Acetic Ether, |
| 2 Cc. Alcohol. |

In this case the mixture remains transparent from the beginning to the end. Let us now consider

TABLE IV. (Not necessary to name in detail.)

⁸ This is not due to the *ether*, but to the water it contains. This phase of the subject presents a fruitful opportunity that cannot now be considered. If pure sulphuric ether be used (U. S. P. 1910) the liquid is clear, to the acetic ether. I infer that acetic ether water free will not cloud (Later Note, 1917). So pronounced is this influence that, if (Table No. III) Sulphuric Ether U. S. P. 1910 be used instead of that of 1880, the meniscus, on the addition of the water, is (1910) about 5, instead of (1880) which is 9.

⁹ In these experiments, owing to the convenience of measuring two (2) cubic centimeters in the cylinder employed (see Fig. 3, p. 948; also Figs. 8, 9 and 10) that amount is as a rule taken as the unit. Hence 2 parts, refers to 2 Cc. Any desired unit may be employed.

Begin with methyl alcohol, pass successively (Table I) to (and including) liquid petrolatum, then reverse and add to this mixture the chloroform, passing successively to (not including) water. The liquid is transparent from first to last.

Consider now the natures of these several ingredients (see qualities of the members of Table I). We find that (Table III) we have assimilated a mass of incongruities into a common whole, by dispersing (preventing surface films forming) each mixture as the respective liquid is added. Of the list, only two—chloroform and amyl alcohol—will mix in equal amounts with every member. The others exhibit varying solvent properties, each excluding wholly or in part, when taken separately, nearly half the members included in the list, many being practically insoluble in each other. And yet, the product above-named becomes, at the start, a menstruum of perfect transparency, and remains so to the end.

Add now to this transparent menstruum (Table III) two parts of water; immediate precipitation results, the upper liquid occupying *nine* (about) parts. (Fig. 6.) Add now two parts of glycerin,—the mixture practically *reverses* itself, the lower layer being about *five* parts (Fig. 7).¹⁰ The original mixture

FIG. 6.

A—Air surface
B—Meniscus between liquids

FIG. 7.

A—Air surface,
B—Meniscus between liquids.

is not a solvent for either of these liquids, but each possesses selective affinities for certain members of the group, resulting in the aforementioned remarkable movement of the line of division. Indeed, when we consider the fact that neither glycerin nor water will mix with any member of the third class and that but one member of the third class will mix freely with any member of the first class, and that the members of the second class will in no case mix with all the members of the first and third classes, it is apparently illogical to expect that we could make a mixture

¹⁰ In repeating these experiments, slight deviations in the final line of separation are likely to occur, even to the extent of one division. This is due, not alone to temperature, but to the "shaking" process of admixture. This (shaking action) has been with me subject for a special study, which can not here be intruded. Physical action seems an important factor. Most perplexing discordant results have, in some instances, not as yet been accounted for.

of liquids from the foregoing list that would dissolve liquid petrolatum, glycerin, and water, even in any appreciable amount.

We have to this point considered separates¹¹ of two layers only.

Three Separates. It is impossible, so far as our experimentation extends, to make a mixture of equal amounts of either the first and second classes, or of the second and third classes, that will separate from each other in three layers. It is possible, however, to select from the central class, and the two extremities, liquids that refuse to unite, forming three layers. Thus a mixture of

- 2 Cc. Glycerin,
- 2 Cc. Acetone,
- 2 Cc. Liquid Petrolatum,

on being shaken together, will separate into three layers, each approximating the amount of the respective original liquid. (Fig. 8.) This equilibrium may be broken by the addition of any solvent that exhibits an attraction for two of the members, in which case one surface film disappears and two layers result. Thus the addition of two parts of water to the aforementioned ingredients will combine the glycerin and acetone (two layers resulting), both (glycerin and acetone) being miscible with water, the liquid petrolatum being excluded, as it is indifferent to all of them. (Fig. 9.) We are again led to the supposition that it must be impossible to unite such opposites (as glycerin and liquid petrolatum) in a single menstruum. To do so, it would appear necessary to construct a solvent (restricted to liquids) such as Paracelsus mentioned and Von Helmont dilated on, under the name Alkahest, or Universal Solvent.

Neutral Solvent It is well known that a solvent capable of holding a solid substance in solution need not necessarily be capable of totally redissolving it after it has been precipitated. It is much easier to produce precipitates than it is to redissolve them in the same solvent. This, too, even though no change to crystalline condition has resulted. Liquid substances, when insoluble in a menstruum, differ from solid precipitates only in being liquid separates. With them, the rule governing resolution of solids holds good. A precipitated liquid in fine division may be very quickly dissolved in an appropriate menstruum, but, if agglutinated into material drops, or resting in layers, it may dissolve very slowly. Hence it is that the order in which liquids are mixed may become of importance in pharmaceutical manipulation.¹² If a selection of the liquids herein considered be mixed in a certain order so as to avoid drop (agglutinated) separations, the liquid may be transparent from first to last, the ultimate result being a clear liquid having the power of dissolving further amounts of each of its constituents.

If, upon the other hand, the same liquids and the same proportions be maintained, but a different order of admixture employed, the mixture may be continually precipitating (paralleling rain in the air), the final result being a liquid precipitate that refuses to redissolve. This fact is illustrated by first making a mixture, as follows (Table V), shaking after each addition:—

¹¹ This term is employed to designate the separated layers of liquids. In the study of the "meniscus" as yet unpublished, it is constantly used. See as examples Figs 4 and 5. Also the different appearances of the meniscus separating the liquids in the other illustrations.

¹² Sometimes, as in making emulsions, the reverse of solution is desired. In these it is desired that the surface films be not easily broken.

TABLE V.

| |
|--------------------------|
| 2 Cc. Liquid Petrolatum, |
| 2 Cc. Turpentine, |
| 2 Cc. Benzin, |
| 2 Cc. Carbon Disulphide, |
| 2 Cc. Benzol, |
| 2 Cc. Amylic Alcohol, |
| 2 Cc. Acetone, |
| 2 Cc. Methyl Alcohol, |
| 2 Cc. Sulphuric Ether, |
| 2 Cc. Acetic Ether, |
| 2 Cc. Glycerin, |
| 2 Cc. Alcohol, |
| 2 Cc. Water. |

This mixture is *clear* until the water is added (see also Table IV).

Repeat now the experiment, mixing the same liquids in the following order:—

TABLE VI.

| |
|--------------------------|
| 2 Cc. Water, |
| 2 Cc. Liquid Petrolatum, |
| 2 Cc. Glycerin, |
| 2 Cc. Turpentine, |
| 2 Cc. Benzin, |
| 2 Cc. Carbon Disulphide, |
| 2 Cc. Benzol, |
| 2 Cc. Amylic Alcohol, |
| 2 Cc. Acetone, |
| 2 Cc. Methyl Alcohol, |
| 2 Cc. Alcohol, |
| 2 Cc. Sulphuric Ether, |
| 2 Cc. Acetic Ether. |

The result will be a mixture that is continuously sectional or emulsified,¹³ and yet, excepting the order of arrangement, the liquids are from the beginning in exactly the same proportions employed in the previous experiment. At no point is the mixture possessed of the same solvent power or the same pharmaceutical opportunities as at any other point. And, at no point does one mixture (Table V) parallel the other (Table VI). The study of such phenomena as this is complicated indeed. Pharmaceutical *art* (Plant Pharmacy) depends in its outreaches largely on the application of processes established by the investigation of such problems as these.

Breaking the Surface Film. A Cosmopolitan Solvent.

From a consideration of the *principles* involved in the foregoing line of experiments, regarding surface films and contact curves,¹⁴ it would seem that it might be possible to make a selection of members of the foregoing series in such a manner as to prevent the formation of the surface films, leaving finally several free bonds of attractive associates, thus making a

¹³ Each mixture is an emulsion which, if allowed to stand, would separate into sections. The study of emulsions is most important and scientific. Research must yet be applied to this phenomenon. My further researches in contact films, capillarity, mass action and connected phenomena, as yet unpublished, show that pharmacy has herein a great scientific opportunity.

¹⁴ Continuous mention is being made of division lines (surface films and meniscus) between liquids, but no direct attention has been called to them. They, however, have been the subject of my some years' empirical study.

B—Meniscus between liquids.

solvent that will be capable of breaking other contact films and consequently of dissolving, more or less, liquids that are opposite in character.¹⁵ On the other hand, it might seem that if a mixture be so constituted as to possess an affinity for either extreme, it must be passive to, or repulse the opposite. Thus, if it be composed of a mixture of solvents out of Classes 2 and 3, that, when combined, have free bonds of attraction for, and possess the power of dissolving liquid petrolatum, it would seem natural to expect it to refuse to dissolve water or glycerin. The reverse is also probable, for it appears irrational to expect that a liquid compounded of Classes 1 and 2 can dissolve liquid petrolatum, which separates from each member of these classes. Carrying this thought further, it seems that if it is possible to devise a mixture capable of dissolving the three incongruities, liquid petrolatum, water and glycerin, it will also dissolve more or less of all fats and oils, as well as other substances soluble in any intermediate liquid of this list.

¹⁵ This writer has observed that liquids capable of completely dissolving each other produce no surface films when mixed in any and all proportions. The term "free bonds of attraction," introduced (coined) herewith, seems to apply in directions where an interlaced solvent is unsatisfied in any class direction. Hence, the expression, "free bonds of attractive associates."

In accordance with this line of reasoning the apparently impossible is to be sought, *e. g.*, a solvent capable of dissolving the extremes, glycerin and liquid petrolatum, neither of which dissolves the other, and neither of which vaporizes into the other. A mixture of the following liquids produces a menstruum of these exceptional qualities. At no time is a contact division (meniscus) possible in making this mixture,¹⁶ regardless of the order of mixing (Table VII):—

TABLE VII.

| | |
|----|--------------------------------------|
| 2 | Cc. Benzol, |
| 10 | Cc. Sulphuric Ether (U. S. P. 1880), |
| 4 | Cc. Acetic Ether, |
| 2 | Cc. Amylic Alcohol, |
| 2 | Cc. Chloroform, |
| 10 | Cc. Acetone, |
| 10 | Cc. Methyl Alcohol, |
| 6 | Cc. Alcohol (U. S. P. 1880). |

Owing to variations in vaporizing points of these ingredients, exposure, even brief, materially alters the solvent reactions of this mixture.

In this menstruum all essential oils tested (those in commercial use and all others attainable), and all members, from 3 to 13 (inclusive) of the three classes of liquids named herein, dissolve in all proportions.¹⁷

If the mixture is made by adding the material to be dissolved in small portions at a time (drop by drop with liquid petrolatum), shaking after each addition, it will also dissolve:—¹⁸

| | |
|------------------|--------------------------------|
| $\frac{2}{7}$ th | its bulk of Water, |
| $\frac{1}{7}$ th | its bulk of Glycerin, |
| $\frac{1}{16}$ | its bulk of Liquid Petrolatum. |

Fixed oils, such as Olive Oil, Castor Oil, Linseed Oil, Cotton Seed Oil, Cod Liver Oil and others tested, dissolve freely,—Castor Oil in all proportions. It dissolves every alkaloid tested, even Morphine being very soluble.

Possibly in no other manipulative direction is the influence of **Temperature.** temperature more important than in the study of solvents and the meniscus of separation. Temperature, in the preceding investigations, was as near 70° F. as attainable, but there were deviations which should have been recorded.¹⁹ Whether or not such reactions as these can be classed as altogether or in part chemical, is problematical. Nevertheless, “mass attractions” that coalesce seemingly unchanged liquid bodies, are most pronounced, and in these, *temperature* applies as directly as in true chemistry.²⁰ In other directions,

¹⁶ If absolute alcohol and pure sulphuric ether (free from water) be used, the qualities as a solvent of extremes are enhanced.

¹⁷ The original notes carry experiments with the ordinary fixed oils. These are omitted, not because they are of no value, but because they open up a series of problems that should be discussed if the record is printed.

¹⁸ Statement of 1885 is approximately verified 1917.

¹⁹ The temperature of 32° F. is finally accepted as most easily attainable, and the best standard.

²⁰ From one view, this word might better be replaced by *liquid*. From another, *liquid* does not fully answer. For example, solid camphor and thymol, triturated together, dissolve each other, a liquid resulting. In like manner, Di-cerberine sulphate triturated with thymol produces a liquid. In these cases solids act as solvents. Indeed, gases may do so. If under a bell glass, a piece of thymol is placed near a piece of camphor, each liquefies the other, by reason of their respective vapors, the thymol first becoming fluid.

as shown in studies of the meniscus between liquids (not yet published) even greater influences are observed than with oils.²¹

The Addition of a Solvent May Over-balance a Perfect Solution and Produce Separation.

It is found that the addition of one solvent to an association of solvents in perfect solution may produce precipitation of one or more of the constituents. Thus, if two parts of alcohol be mixed with two parts of chloroform, and to the clear solution two parts of water be added, separation ensues, the liquids producing two sections about equally divided. The chloroform holds part of the alcohol, and the water the rest of it. However, the hydro-alcoholic layer above the line holds some chloroform in solution and the chloroformic-alcoholic layer below the line holds some water, so that in the equilibrium that is established, all the liquids are partly represented in both sections. This is also exhibited in the separation shown in Tables V and VI, when the water is added to the clear liquid.

Process of Establishing Solubilities.

Where liquids have no solvent affinity whatever, for example liquid petrolatum versus either water or glycerin, a mixture of them in any possible proportion, separates, on standing, each in its full amount. But, if they mutually coalesce, even slightly, the only satisfactory method to determine their solubilities appears to be to add one liquid, drop by drop, to a given bulk of the other, shaking well after each addition, until finally, milkiessness follows. To establish reverse solubility, reverse the liquids. This is, in our experiments, accepted as establishing the solvent point of each for the other, the decision being *not from the increase in bulk of the mixture*, but from the amount of the respective liquids added. Here, too, care must be employed to establish the temperature with exactness, if a record of proportions is made.

Change of Location of Line of Demarcation No. Criterion of Solubilities.

The change in position of the line of demarcation does not show the proportion dissolved where two liquids are shaken together, and allowed to separate. The division line then locates itself between the *balanced* new liquids. Although each has dissolved much of the other, the meniscus of separation may be on or near the original line.

Example. If 2 Cc. of alcohol, 2 of water and 2 of chloroform be mixed, the line of separation will be at $5\frac{1}{2}$, indicating that the chloroform has dissolved $2\frac{1}{2}$ parts, which would make it take $\frac{1}{2}$ part of water. (Fig. 10.) The fact is, however, that most of the water is in the upper layer. Again, take liquid petrolatum and the mixture of Table VII. The addition of liquid petrolatum, drop by drop, demonstrated the solution of $\frac{1}{16}$ th its bulk. But if we mix equal amounts (5 Cc. each), on separation the liquid petrolatum *rises* $\frac{3}{4}$ th Cc., which would indicate that it was not at all soluble in the liquid that had previously been shown to dissolve it.

Perhaps a more forcible exhibition of such a disturbance is shown in Table IV and "Breaking the Combination," where, in a transparent compound of 24 Cc.,

²¹ The separation of dissolved solids may be very slow when the solution is cooled below their saturation point. Liquids separate almost instantly. Very slight temperature alterations produce immediate sectional disturbances. The temperature change between opalescence and transparency may be too slight to affect the ordinary thermometer.

the addition of 2 Ce. water produced nearly an equal division. Since the water is mainly in the upper layer, it apparently dissolved many times its bulk of the liquid. In reality, it became a disturber, breaking the equilibrium of the complex solution, taking its place as a part of the section with which it chiefly affiliated. Very difficult would it be to establish the exact amount of the integral constituents in either section.

Apply now the foregoing to the series of solvents considered in this paper, beginning with No. 14, liquid petrolatum. It is found that on mixing two parts of each, when the sulphuric ether and acetic ether are successively added, the mixture clouds (see Table V). Then, until the water (No. 2) is reached, the solution is transparent, but on addition of two parts of water, separation ensues, the lower layer consisting of *four* parts instead of two, as might possibly be expected (two parts of water having been used) if division lines were our guide. Continuing the addition of successive portions of water for a reasonable time, it is seen that there is a nearly uniform increase of the lower layer over the two parts of water added, as is shown by the following table:—

| | | |
|------------------------------|------------------|--------|
| 2 parts water produce about | 4 | parts. |
| 4 parts water produce about | 6 $\frac{1}{2}$ | parts. |
| 6 parts water produce about | 9 | parts. |
| 8 parts water produce about | 11 $\frac{1}{2}$ | parts. |
| 10 parts water produce about | 14 | parts. |

Finally, if carried far enough, the addition of water results practically in the separation of only the proportion added.

In these examples, the equilibrium established after the water was added, resulted in the formation of two liquids that changed in constitution with each addition of the single substance, water. Simultaneously the solvent power of the sections altered, as is shown by the varying proportions (Movement of Meniscus) that result while the additions were being made. Finally, the members of the third class, especially liquid petrolatum, are nearly separated from the members of the first class, especially glycerin and water, while the intermediate members arrange themselves according to their affinities, in varying proportions in the two layers. After this, the addition of water can not decrease the upper layer, and upon the other hand liquid petrolatum in any amount can not dissociate the lower layer.

**An Endless Series of Solvents
Produced by Neutral Solvents
Combined with Plant Constituents.**

Whenever we abstract what is apparently a single substance from a plant, by means of water or alcohol, we form at the same time, as the solution progresses, a series of new solvents, having successive powers of abstracting other plant constituents. Thus are formed a continuously changing line of new liquids, that may be of as many different qualities as it is possible to vary the proportions of the original liquids (resulting from solution of solids), these becoming *new* solvents, in their subsequent action on the soluble plant materials.

Each solid substance that the menstruum dissolves, becomes in turn a part of a new liquid, which is then a thing in itself, and may itself dissolve another substance, insoluble in the original menstruum, thereby forming a menstruum quite different from either of the preceding, and which is capable of dissolving a third substance, a new liquid springing thus into existence with each successive change. No solid

body is present at any time after the solution has formed, and yet the *solution of a solid* produces each new solvent.²² We have a mixture of liquids possessed of individual solvent qualities, as much so as though we had mixed various liquids such as ether and water. Finally, the last liquid formed may not be able to hold in solution a substance that, originally dissolved, constituted a part of the first liquid. This body may then in part be thrown out of solution, resuming the solid form as a precipitate. In so doing, it alters the attributes of the solvent and starts a chain of *backward* reactions and precipitations. Such a "*separate*"²⁴ may be either liquid or solid. It may rise to the surface, or it may subside. It may be visible (solid), or invisible (liquid). It may be mucilaginous or gelatinous, as transparent as the medium it rests in, but yet not a true liquid or a pronounced solid.²³ As this "backward" reaction follows, chains of alterations and precipitations result, so familiar to persons perplexed by ever-altering plant solutions. Bold must be the man who announces that he comprehends the interchanging rearrangements continuously taking place in a solution of associated plant constituents, seemingly stable and apparently quiescent.

Our three classes of menstrua, with their fourteen numbers (see Table 1) thus afford *in themselves*, as various proportions are used, the possibility of an infinite line of combinations. The successive liquids, produced by means of varying abstractions of the constituents of a single plant, may also dovetail into chains of compound solutions in which lines of separation are lost as these substances coalesce, each into the others. In this field, no recorded experiences govern us. The explorer has not attempted even to systematize the various phases of the problem, as applied to the principal constituents of a single known drug, acted upon as a whole by any compound menstruum, indeed, by any simple liquid.

But before we attempt to suggest specific application of these possibilities to plant pharmacy, we need consider an as yet seemingly incidental, but yet all-important and striking feature of this series of experiments, *viz.*, the *plane of separation* (meniscus) between the separated classes of solvents. This study (meniscus) dovetails into and introduces *Capillarity*, one of the most vital influences in the practical application of pharmacy to plant preparations, but as yet totally neglected.

Addenda, 1917—In various directions, necessarily unmentioned, this writer has (since 1885) applied most pleasurable research, the results having been recorded in fragmentary manuscript form during the passing years. He hopes to be permitted to contribute to our Society next year a continuance of these old-time investigations, the same being localized on phenomena connected with capillarity,—the meniscus, surface films, what he denominates as the pendant drop (see the upper A, Fig. 4, and pendent drops A-B, Fig. 9), and "mass action" (term used originally) and physical influences connected with pharmaceutical problems. Let us then pass to the *Meniscus*.

²² This phenomenon is not restricted to plants, or plant products. See "Precipitates in Fluid Extracts," *Am. Pharm. Assn. Proceedings*, 1879-1885.

²³ This term may be considered very expressive of this reaction.

²⁴ In my opinion opportunities will be afforded researchers of the future to *see* the at present *invisible*. I can not but believe, for example, that there are zones, or emulsion surfaces, now *invisible*, but which yet will be *seen* by methods now unknown. This conclusion is furthered by the study of oils. Consider, as an example, the practically invisible globulus of tapioca in some forms of soup, enveloped in oil, water and mucilage.

JOURNAL OF THE

MAGNESIUM SULPHATE.*

BY JACOB DINER.

Common salt has been used as a purgative by the ancients and it is reported that Paracelsus and his followers employed the tartrates of potassium for similar purposes. But the attention of physicians was drawn to this class of cathartics by Glauber in 1658 through his discovery of the *Sal Mirabile* commonly known as sodium sulphate.

In 1663 the Duke of Holstein paid 500 thalers for the secret of the preparation of the long famous *Sal Polychrestus* or *Tartarum vitriolatum*, probably a mixture of the neutral and the acid sulphates of potassium.

Seignette, an apothecary of Rochelle, prepared the sodium and potassium tartrate in 1672. Three years later, 1675, Grew first observed the presence of a purgative salt in the springs of Epsom and this salt was afterwards identified as magnesium sulphate by Dr. Black.¹

The action of these salts was but indifferently understood for some time. The discovery of the phenomenon of osmosis² gave the first scientific explanation of the action of saline cathartics.³ Liebig⁴ simultaneously came to the same conclusion with Poisseuille, but did not publish his observations until some years later. However, the theory of Poisseuille and Liebig and many of their adherents that the endosmotic power of the saline alone determined its purgative action was disproven by the experiments of Aubert⁵ who compared three of the most important saline cathartics and found that sodium phosphate possessed an endosmotic power of over twice that of sodium sulphate, and this in turn had an endosmotic equivalent of nearly three times that of magnesium sulphate. Accordingly one would suppose that sodium phosphate would be the strongest saline cathartic and magnesium sulphate the weakest, while the very opposite is the case.

In 1854 Colin⁶ and later on Moreau⁷ performed the now classical experiment of injecting saline solution into an isolated loop of intestines and demonstrated the increase in volume of the aqueous contents. Still the nature and origin of this increase was not clear.

RELATIONS OF THE SALTS TO PERISTALSIS OF GASTRO-INTESTINAL CANAL.

McCallum⁸ felt justified, after a series of animal experiments, to draw the conclusion that all those salts which act as purgatives when introduced into the stomach or intestine, have the same action when injected subcutaneously or intravenously.

Meltzer and Auer⁹ proved that subcutaneous and intravenous injections of magnesium salts produce neither purgation nor intestinal peristalsis. The moderate peristalsis produced by exposing the intestines to air, by destroying the dorsal cord or by intravenous or subcutaneous injections of certain saline purgatives and the powerful peristaltic constrictions produced in all parts of the gastro-intestinal canal by intravenous injections of ergot, eserine, or barium chloride can be completely inhibited by an intravenous injection of magnesium sulphate or chloride in doses insufficient to embarrass the respiration to any serious degree.

The *post mortem* peristalsis of animals which received intravenous injections of magnesium sulphate is considerably less in evidence than that of normal animals.

* Read before Scientific Section, A. Ph. A., Indianapolis meeting, 1917.

Auer¹⁰ demonstrated in a series of experiments in which magnesium sulphate was injected into the jugular vein, in concentrations ranging from 1.7 to 25 percent, in amounts between 1 mil and 80 mls, that most of the rabbits showed no signs of purgation; the faeces passed during observation (2 to 4 hours) were dry and small in amounts.

Hay¹¹ summarizes his results as follows:

A saline purgative always excites more or less secretion from the alimentary canal, depending on the amount of the salt and the strength of its solution, and varying with the nature of the salt.

The excito-secretory action of the salt is probably due to the bitterness as well as to the irritant and specific properties of the salt and not to osmosis.

The low diffusibility of the salt impedes the absorption of the secreted fluid.

Between stimulated secretion on the one hand and impeded absorption on the other there is an accumulation of fluid in the canal.

The accumulated fluid, partly from ordinary dynamical laws, partly from gentle stimulation of the peristaltic movements excited by distension, reaches the rectum and produces purgation.

Purgation will not ensue if water be withheld from the diet for one or two days previous to the administration of the salt in concentrated form.

The absence of purgation is not due to the want of water in the alimentary canal but to its deficiency in the blood.

Under ordinary conditions, with an unrestricted supply of water, the maximal amount of fluid accumulated within the canal corresponds very nearly to the quantity of water required to form a 5 or 6 percent solution of the amount of salt administered.

If, therefore, a solution of this strength be given it does not increase in bulk.

If a solution of greater strength be administered it rapidly increases in volume until the maximum is attained. This it accomplishes in the case of a 20 percent solution in from one to one and a half hours.

After the maximum has been reached it begins gradually and slowly to diminish in quantity.

Cæteris paribus, the weaker or, in other words, the more voluminous the solution of the salt administered is, the more quickly is the maximum within the canal reached, and accordingly purgation follows with greater rapidity.

Unless the solution of the salt is more concentrated than 10 percent it excites little or no secretion in the stomach.

The salt is absorbed with extreme slowness by the stomach of the cat.

The salt excites an active secretion in the intestines, and probably for the most part in the small intestines, all portions of this viscus being capable of yielding the secretion in almost equal quantities.

The salt does not purge when injected into the blood and excites no intestinal peristalsis.

The magnesium sulphate is powerfully toxic when injected into the circulation, paralyzing first the respiration and afterward the heart and abolishing sensation or paralyzing the sensory-motor reflex centers.

According as the salt solution within the intestine increases in amount there occurs a corresponding diminution of the fluid in the blood.

The blood recoups itself in a short time by absorbing from the tissues a nearly equal quantity of their fluids.

The salt, after some hours, causes diuresis, and with it a second concentration of the blood which continues so long as diuresis is active.

Leubuscher¹² takes up the theory advanced by Liebig and Poyseuille that the action of the salt is purely due to endosmosis, that of Auer with reference to cathartic action when introduced parenterally and Hay's and Voit's, Bauer's, Moreau's, Lauder Brunton's etc., all with reference to influence of the salts on peristalsis. The results of his experiments seem to show that:

The increase in peristalsis plays only a minor part in the cathartic action of the salt.

No matter how the salts are introduced into the intestines there is always a secretion of fluid into the canal, and this is to be considered the main cause of the cathartic action.

There is no evidence that the salt inhibits resorption.

When introduced into circulation in sufficient amounts these salt have a constipating effect.

The investigations of Meltzer¹³ on the nature of the action of magnesium as a cathartic suggest that magnesium sulphate when introduced by way of the mouth combines with the sodium chloride found in the stomach and with the alkalies and carbon dioxide of the circulation, and splits up into sodium sulphate and magnesium carbonate. The sodium sulphate is absorbed into the circulation and causes intestinal peristalsis. The magnesium carbonate acts possibly within the intestines in two ways: It attracts liquid within the lumen of the intestines thus distending it and probably acts directly on the mucosa as a chemical stimulus. It is possible that magnesium sulphate, either as such, or in new formed combination, may have simultaneous actions of exciting and inhibitory nature on the functions of the animal body and thus bring about tonus, rhythm and peristalsis of the intestine with resultant evacuation.

NERVES AND ANAESTHESIA.

Meltzer and Auer¹⁴ have shown that solutions of magnesium salts, even in strong concentrations, when applied directly to the nerve trunks of animals, never seemed to produce irritation. By applications of solutions of magnesium salts to nerve trunks the conductivity can be interrupted and a more or less complete block for afferent and efferent, or normal or artificial impulses, can be established. This can be accomplished by hypertonic, isotonic and hypotonic solutions. The more concentrated the solution the sooner the effect is established.

In general it takes more time for the magnesium solutions to cause a nerve block than for other known local or general anaesthetics. The block produced in the nerves by magnesium solutions disappears sometime after removal of the solutions; the recovery of the nerve is greatly assisted by washing with Ringer's solution.

The solutions of magnesium salts affect the cardiac fibers more readily than the efferent fibers for the oesophagus and the afferent respiratory and vasoconstrictor fibers within the vagus; also the sensory fibers within the sciatic nerve are more readily affected than the motor nerve fibers. It is believed that the difference is not due to a selective action of the magnesium solutions upon the different nerve fibers but to a difference in the irritability of the nerve endings of these nerve fibers.

In 1899 Meltzer¹⁵ demonstrated, on a rabbit, that the effect of an intracerebral injection of potassium chlorate was that of producing a long series of convulsions, forced movements, opisthotonus, etc., and in another rabbit the opposite effect by intracerebral injection of magnesium sulphate. Without preceding convulsions the rabbit became paralyzed in a short time. No explanation of this phenomenon was made at that time. In subsequent experiments made by Meltzer and Auer¹⁶ it was determined that:

A certain dose of magnesium sulphate will produce a deep, often long-lasting anaesthesia with complete relaxation of all the voluntary muscles and aboli-

tion of some of the less important reflex activities, which anaesthesia terminates in complete recovery.

That a large dose of magnesium salts will produce a profound anaesthesia and general paralysis which sooner or later leads to a calm death without being preceded or accompanied by any symptoms of excitation and not a single instance was observed in which that salt produced an increase of excitation; on the contrary any effect which this salt produced was invariably in the direction of a reduction of excitation or of its complete temporary or permanent abolition.

Haubald and Meltzer¹⁷ were the first to report the production of spinal anaesthesia by magnesium sulphate.

Emil Stransky¹⁸ has established the fact that subcutaneous injections of magnesium sulphate which produce narcosis cause an increase of the magnesium salts in the blood plasma; in the other organs there is either no increase at all or but very slight increase in the magnesium contents.

The relation of calcium contents to magnesium contents in the serum, which normally is strongly on the calcium side, is considerably altered in favor of magnesium so that the magnesium contents exceed even after awakening. It appears that the condition of narcosis is determined by a definite maximal value of the Ca/Mg quotient.

TETANUS.

Meltzer and Auer¹⁹ show that: Intraspinal injections of magnesium sulphate, in doses which do not affect the respiratory center or other vital function, are capable of abolishing completely all clonic convulsions and tonic contractions in cases of human tetanus, and experimental tetanus in monkeys. The relating effects of the injections may last 24 hours or longer. In experimental tetanus in monkeys early intraspinal injections of magnesium sulphate are capable of retarding the progress and development of the tetanic symptoms.

The usual amount used in humans is 1 Cc. of a 25 percent solution for every 20 pounds of body weight.

A number of cases of successful treatment of tetanus by means of magnesium sulphate administered intraspinously are to be found in the medical literature²⁰⁻²³.

On the other hand there are a number of cases, similarly treated, with fatal termination²⁹⁻³²:

Rozenowsky³³ reports from observations made during the present war that whenever the antitoxin treatment was associated with magnesium sulphate injections, either intralumbar or subcutaneous, the most favorable results were obtained. Furthermore he asserts that no unfavorable results or dangers from the use of magnesium sulphate were observed by them.

Robertson³⁴ gives a summary of some results obtained by the different methods of administering magnesium sulphate in tetanus.

Intraspinal Method: (4-5 Cc. of 25 percent solution) 81 patients, severe cases, with incubation period of less than five days, 36 died, 45 recovered, mortality 44.4 percent.

Anders and Morgan: 216 cases.

| | | |
|------------------------------------|--------------------|------------------------------|
| 38 cases incubation period 5 | days or less, no | antitoxin—mortality 95% |
| 23 cases incubation period 5 | days or less, plus | antitoxin—mortality 74% |
| 58 cases incubation period 6-10 | days or less, no | antitoxin—mortality 79% |
| 56 cases incubation period 6-10 | days or less, plus | antitoxin—mortality 71% |
| 18 cases incubation period over 10 | days | no antitoxin—mortality 93% |
| 23 cases incubation period over 10 | days | plus antitoxin—mortality 35% |

Robertson concludes that the administration of magnesium sulphate by intralumbar injection has brought about a definitely certain, even if small, decrease in the percentage of deaths from tetanus, as well as causing an undoubted diminution in the agony and suffering etc., etc.

Subcutaneous Method: (0.57 Mg. per kilo). Twelve cases, incubation period 6-10 days, mortality 8.3 as compared with 48.6 percent for the same group treated by intralumbar method. In addition to this 15 cases with incubation period of 10 days and over all recovered, reducing the mortality rate quoted above to 3.7 percent.

Intravenous Method: (3 percent solution). No conclusive data. Dangers: Overdose rapidly injected into vein; instant death; heart stops before respiration; such accidents rarely happen with subcutaneous injections. The sudden untoward action of the magnesium salts can be overcome by injections of calcium chloride,³⁵ or by physostigmine.³⁶

We may conclude our remarks on magnesium sulphate and tetanus with a reference to Meltzer,³⁷ who points out that the fatal issue in tetanus is principally due to the spasms which profoundly affect the functions of respiration and circulation. He synthesizes briefly the four ways of magnesium sulphate medication in tetanus as follows:

1. *Subcutaneous injections*—Dose not to exceed 2 Cc. nor less than 1.22 of the 25 percent solution per Kg. body weight. To be injected four times in 24 hours. No massage. Light etherization or morphinization should precede the injection of magnesium sulphate.

Administered in this way magnesium sulphate exerts its effect very slowly and principally by cumulative action. Will not relieve immediately severe and dangerous spasms.

2. *Intramuscular injections and inhalation of ether.*—The patient should be fairly well etherized and 2 Cc. of a 25 percent solution magnesium sulphate per Kg. body weight be injected into the muscles of the thigh. At the end of the injection massage the thigh and continue light ether anaesthesia for about 20 minutes longer. This method may greatly relieve even severe spasms, in less than half an hour, but the beneficial effect is liable to pass off completely after two or three hours. There may be local reaction and for this reason the injections should not be repeated too often nor should this method be used as a routine treatment.

3. *Intravenous injections.*—The concentration of the solution should be about 3 percent (isotonic) and not more than 5 Cc. per minute should be permitted to run into the vein. This mode of administration is capable of relieving dangerous effects of the spasms (tetanus of the diaphragm, constriction of the larynx) more promptly than any other method of application. But the beneficial effect may completely disappear in less than 30 minutes and furthermore the circulation may become affected by direct action on the myocardium. This method should therefore be reserved for emergency cases only.

4. *Intraspinal Injection.*—The dose to be injected, at the usual place in the lumbar region, should be 1 Cc. of a 25 percent solution for every 10 Kg. of body weight. The results of this method of treatment may become evident in less than half an hour, and after one hour the relaxation may be complete. The extent as well as the duration of the relief afforded to the patient is greater when the magnesium solution is given by the intraspinal method than by any other method of administration. The relief may last between 12 and 30 hours.

SEPSIS.

Harrar³⁸ used a solution of 30 grains magnesium sulphate in 8 ounces of water, and sometimes a similar quantity of a 2 percent solution for intravenous injections in a number of cases of puerperal sepsis. In all of his cases blood culture and uterine culture were made, many proving positive, showing streptococci. The remarkable results obtained lead the author to the conclusions that:— In the quantities and

dilutions described it is absolutely harmless when administered intravenously to women suffering with puerperal infection. That it is of more value early in the course of infection and seems to be of no value in chronic cases of secondary thrombophlebitis or pyemia. That the action of the drug seems to be chiefly on the organisms circulating in the blood. That it shortens the course of bacterial toxemias; and that it has reduced the mortality in puerperal septicemia in their hospital, from 93 to 20 percent.

According to Huggins,³⁹ a number of cases suffering from puerperal infection were treated by *slow* intravenous injections of magnesium sulphate with remarkably favorable results.

Freese⁴⁰ reports the use of magnesium sulphate and glycerin in the treatment of infections. A number of cases of infections (external) yielded very promptly to "hot solution of glycerin and salt" but he does not state the proportions used.

ACTION OF MAGNESIUM SULPHATE ON HEART, ETC.

Mathews and Jackson⁴¹ hold that the action of magnesium sulphate upon the heart is practically the same throughout the mammalian, avian, reptilian and amphibian classes. This action consists of a very marked depression, characterized by an immediate decrease in the amplitude of the heart beat and of simultaneous progressive slowing which soon leads to a complete standstill, from which the heart may be recovered by artificial stimulation. Adrenalin and squill can not be used to offset this depression.

MacNider and Mathews,⁴² after a discussion of the various theories as to origin and maintenance of the heart beat, and based on their observation of the behavior of the heart in response to certain physical and chemical stimuli while under the influence of magnesium sulphate, conclude that magnesium sulphate depresses the nervous mechanism in the heart, both accelerator and inhibitory—the latter more than the former to such an extent that it will not transmit to the contractile tissue impulses of the same degree as are set in by the usual physiological stimulus, whatever that may be, but that it will transmit the stronger electrical stimulus or the normal motor impulse after the heart muscle has been rendered more irritable.

RESPIRATION.

Meltzer and Auer⁴³ proved that magnesium salts in intravenous injections are very toxic, even in small doses, and that repetition of the injections within a relatively short time increases the susceptibility of the animal to the toxic effect. The first effect is on the respiration, which becomes completely inhibited. The respiratory center is deprived of its responsiveness to asphyxiated blood, and the reflex effect of sensory stimuli is greatly reduced. Large doses of salt, injected with rapid speed, affect also the tonus of the vasomotor center, but this toxic effect is not, as a rule, extreme and wears off sooner than the effect on the respiratory center.

SALIVARY DIGESTION.

Patten and Stiles⁴⁴ have shown that even concentrated solutions of magnesium sulphate do not inhibit the action of ptyalin on carbohydrates. The most striking instances of accelerating effects (upon the action of ptyalin) were obtained with salts of magnesium, calcium and barium.

ANTAGONISTIC ACTION OF CALCIUM AND MAGNESIUM SULPHATE.

Meltzer and Auer⁴⁵ show that apparently the respiratory mechanism, which becomes affected by magnesium more readily than any other function, is also more easily protected against this influence by calcium. Intravenous infusion of various calcium salts is capable of completely reversing the pronounced inhibitory effects brought on by various magnesium salts. The respiratory paralysis, the lost lid reflex, the motor paralysis, the lost general reflexes, the general anaesthesia, the loss of consciousness, the depression of the cardio-inhibitory action of the vagus, the lowering of the blood pressure—all are reversed and completely restored in a very short time by the injection of a comparatively small quantity of calcium salt. This does not hold good, however, for conditions brought about by large doses of magnesium.

On the other hand strontium differs in its action from that of calcium with respect to the neutralization of the inhibitory effect of magnesium. While it (strontium) does cause a very slight improvement of the respiration it seems to aggravate and hasten the inhibitory symptoms due to magnesium, especially the paralysis.

Joseph⁴⁶ has demonstrated that eserine tremor can be abolished by magnesium sulphate and that magnesium has a certain value as antidote for eserine poisoning but not on eserine myosis.

Joseph and Meltzer⁴⁷ also gave a demonstration on rabbits before the American Physiological Society: One rabbit received an intramuscular injection of 1.2 Cc. magnesium sulphate per kilo body weight with fatal results. Another rabbit received a similar dose of magnesium sulphate with a simultaneous injection of barium chloride and this rabbit appeared to be in good, normal condition, while still another rabbit, receiving a dose of barium chloride similar to that given to rabbit No. 2, promptly succumbed. The authors draw these conclusions from their work: The fatal action of magnesium is due to paralysis of respiration and barium counteracts just this effect of magnesium. It differs from the antagonistic action of calcium inasmuch as calcium antagonizes all the effects of magnesium while barium picks out only the respiration, the animal remaining anaesthetized, and paralyzed. Furthermore the experiment also proves that magnesium antagonizes the fatal effect of barium.

PATHS OF EXCRETION.

Mendel and Benedict⁴⁸ show that when soluble magnesium compounds are introduced parenterally into animals the greater portion of the excess injected leaves the body by way of the kidneys in less than 48 hours, thus emphasizing the importance of the kidney in the elimination of magnesium salts. The intestinal path is of minor, if any, significance for magnesium introduced under these conditions. A considerable quantity of magnesium may be retained in the body for a period of two weeks. The parenteral introduction of magnesium sulphate in dogs and rabbits is never followed by purgation.

The increased excretion of magnesium by the kidneys is accompanied by a marked rise in the urinary output of calcium while the calcium output in the faeces is decreased at the same time.

Inasmuch as magnesium sulphate was much in use for various purposes, among these the administration, subcutaneously, to relieve tetany in children, Courtney

and Fales⁴⁹ undertook a series of experiments to ascertain the rate of elimination in order to avoid a possible toxic accumulation of the salt in the body. They come to the conclusion that magnesium is eliminated rapidly enough, chiefly by way of the urine, to nullify a possible danger of cumulative effect of magnesium.

Meltzer and Lucas⁵⁰ show that magnesium salts when introduced subcutaneously are eliminated to a great extent through the kidneys. In nephrectomized rabbits the susceptibility to the toxic effect of magnesium salts is increased by about 50 percent.

The profound anaesthesia which a toxic dose of magnesium produces in nephrectomized rabbits may be continuous for 24 hours or longer. The cumulative effect of magnesium salts in nephrectomized rabbits is very striking. The effect of several subminimum doses is equal to the effect produced by the sum of these doses given in a single injection.

A dose which when given soon after nephrectomy is fatal, causes only a non-fatal anaesthesia when given 18 hours or later after nephrectomy. Probably at that period vicarious paths develop sufficient for the elimination of a fraction of the salts. It is probably for this reason that the profound anaesthesia produced by a proper dose of magnesium salts is partially recovered from in about 12 to 18 hours after nephrectomy.

BLOOD PRESSURE AND EDEMA.

Very little, if any, attention has been paid to the influence of magnesium sulphate on blood pressure.

I wish to report briefly on a few cases which have come under my personal observation.

Case 1—Woman 68 years of age. Paroxysmal tachycardia. B. P. 185 mm. Hg. Systolic; 110 diastolic. A daily dose of 4 Gm. magnesium sulphate in 25 percent dilution (16 Cc. oral administration) resulted in a reduction of the systolic pressure to 154, diastolic 104, with marked prolongation of tachycardial intervals.

Case 2—Man 70 years of age, marked dyspnoea, irregular arrhythmia, cardio-nephritic. Systolic 180, diastolic 100. After six months' treatment there has been a gradual drop in the systolic pressure to a final 146 with unchanged diastolic and marked improvement in breathing. It has remained in *status quo* for the past four months with only an occasional dose of magnesium sulphate.

Case 3—Woman 72 years of age. Edema of extremities, nephritic and diabetic. Mitral and aortic lesions. Systolic 240, diastolic 160. Has been under treatment for two and a half years. Daily dose of 4 Gm. magnesium sulphate. At present 165-110. Urine shows only an occasional trace of albumin. Glycosuria is intermittent, no edema.

Several other cases have shown similar results but those quoted are the most striking in the series. The action of the magnesium sulphate in these cases is two-fold: First, by its purgative action it prevents intestinal stasis and reduces the resulting auto-intoxication to a minimum; second, by adsorption of water from the blood and tissues it reduces the circulating volume and decreases the blood pressure and edema. It must be borne in mind that the magnesium sulphate should be administered in concentrated form and no water must be allowed within three hours after administration of the drug.

PALATABLE MIXTURES.

In conclusion I wish to mention a few ways in which magnesium sulphate may be administered in a palatable way. For the sake of simplicity I have presented these in the form of prescriptions:—

1. Magnesium Sulphate. 30.00 Gm
Aromatic Sulphuric Acid 8.00 mls
Water. 60.00 mls
Glycerin to make 120.00 mls
Dose: One tablespoonful.
2. Magnesium Sulphate. 30.00 Gm.
Fresh Orange Juice 30.00 mls
Water. 60.00 mls
Glycerin to make. 120.00 mls
Dose: One teaspoonful.
3. Magnesium Sulphate 30.00 Gm
Tincture Cardamom Comp. 10.00 mls
Citric Acid. 1.00 Gm
Water. 60.00 mls
Glycerin to make 120.00 mls
Dose: One teaspoonful.
4. Magnesium Sulphate 30.00 Gm
Citric Acid. 1.00 Gm
Syrup Sarsaparilla Comp 60.00 mls
Water to make 120.00 mls
Dose: One teaspoonful

Carlton⁵¹ suggests the following mode of prescribing magnesium sulphate:

| | |
|-----------------------------|-------------|
| Magnesium Sulphate | 1000.00 Gm. |
| Fluidextract Cardamom Comp. | 30.00 mls |
| Vanillin. | 1.50 Gm. |
| Garantose. | 16.00 Gm. |
| Alcohol | 16.00 mls |
| Glycerin | 60.00 mls |
| Coffee (roasted and ground) | 60.00 Gm. |
| Water to make | 2000.00 mls |

DIRECTIONS: Stir the ground coffee in 2000 mls of boiling water, let stand 10 to 20 minutes. While hot add the magnesium sulphate and stir until dissolved. Dissolve the vanillin in the alcohol, add the glycerin and fluidextract and mix with the magnesium sulphate solution; when cold add the garantose, filter and bring up to the volume by addition of water. Thirty mls contain 15 grammes of magnesium sulphate

SUMMARY

- 1.—Magnesium sulphate is one of the promptest acting saline laxatives of our present materia medica.
- 2.—The degree of dilution modifies the rapidity of action.
- 3.—The mode of its cathartic action is presumably due to a combination of absorption of fluid from the blood, stimulation of secretion by the intestinal mucosa and increasing tonus and stimulating peristalsis of the intestinal musculature.
- 4.—Subcutaneous and intravenous injections do not produce catharsis.
- 5.—It produces local and general anaesthesia, but is not free from danger by reason of its marked depression of the respiratory center.
- 6.—Its toxicity is in inverse proportion to the ability of the animal to eliminate it from the system.
- 7.—Elimination takes place chiefly by kidney.
- 8.—The toxic effects are antagonized by calcium, barium and strontium salts but each to a different extent.
- 9.—It has proven of value in septic conditions, both local and general.
- 10.—In the treatment of tetanus, particularly in association with antitoxin, it has robbed war of some of its terrors.
- 11.—In concentrated solution it reduces blood pressure and edema.
- 12.—A few methods for dispensing palatable magnesium sulphate for oral administration are suggested.

FORDHAM UNIVERSITY SCHOOL OF MEDICINE

SOY BEANS AND SOY BEAN OIL.*

BY E. V. HOWELL.

This bean is a native of southeastern Asia. It is at present the most important legume grown in Japan, China and Manchuria, where it is grown almost exclusively for human food. It has been cultivated from a remote period, each district having its own distinctive variety, some two hundred kinds in all. It was brought to Europe in comparatively recent times and there cultivated in botanic gardens for more than a hundred years without attracting any particular attention. The bean was introduced into England in 1790. Apparently the first mention of soy beans in American literature, was in the *New England Farmer*, October 23, 1829, in an article by Thomas Nuttall. He grew a variety with red flowers and chocolate-

* Scientific Section, A. Ph. A., Indianapolis meeting, 1917.

brown seed in the botanic garden at Cambridge, Mass. From his observations he wrote a brief account of it: "Its principal recommendation at present is only a luxury, affording the well-known brown sauce 'Soy,' which at this time is prepared only in China and Japan." Just two years later, November 23, 1831, an article appeared in the same journal regarding the culture of the plant at Milton, Mass., the seed having been obtained from Nuttall. Further mention of the plant appeared in a brief account under the name "Japan Pea," by A. Ernst, Cincinnati, Ohio.

In 1854, the Perry Expedition to Japan brought back two varieties of "soja beans," one with white seeds, the other with red seeds. They were distributed by the Commissioner of Patents in 1854, and from then on frequent references to the plant occur in agricultural literature under the names Japan pea, Japan bean, and Japanese fodder plant. The name soy or soja bean followed. Prof. Henry Trimble, in June 1896 and in November 1897, in the *American Journal of Pharmacy* published excellent papers on the soy bean.

It is not adapted to sections with a short growing season; however, from the large number of varieties to choose from, there is little difficulty in growing it over an extensive section of the United States, particularly in the South. Scarcely more than a dozen varieties have as yet been grown in large quantities.

IMPORTANCE.

I think the soy bean is the most important plant introduced into the South within a hundred years. This opinion is based on the range of the plant, the value as a soil improver, and the numerous uses of the seed and oil, together with the fact that the present cottonseed oil mills can produce the oil with practically no change in machinery and thus double their mill season. The beans can be stored, as they are practically immune to insects. Especial emphasis is placed on this statement in the present demand for food on account of the war. In Japan the bean forms one of the most important articles of food, by nature a meat, to go with the starch of rice. The Chinese make from the beans a cheese resembling our own cheese, while the Japanese make the well-known sauce for rice or fish, soy or suey sauce. It is one of the principal ingredients in "Tofu" (bean curd), natto (steamed beans), and white and brown miso, which is like our molasses brown bread.

The beans are eaten as a vegetable, or in soup, or picked green, boiled and served cold with soy sauce, and sometimes as a salad. A "vegetable milk" is also produced from the bean, and this milk is the basis for the manufacture of the different vegetable cheeses. This milk is used fresh, and also a condensed milk is made from it. All of these foods are in daily use in Japanese homes, and for the poorer classes form the principal protein diet.

A factory for the production of this milk has been recently established in America. This can be used in cooking, by bakers, confectioners, and chocolate manufacturers. I have before me the following food articles in which soy bean meal is the principal ingredient: Egg substitute No. 1, egg substitute No. 2, colored cocoanuts, coffee substitute, cocoa substitute, roasted malted nuts, coloring curry powder, cutlet powder, soy and navy beans with pork, the equal of any pork and beans.

The use of the soy meal for soups, for proportional use in muffins, cookies, fritters, croquettes, biscuit, and loaf bread is unlimited. Its use is checked only

by our prejudice for certain customary flavors, just as northern people and Europeans do not use corn meal. In other words, North Carolina, if forced to by war conditions, could largely exist on the soy beans crushed in the State this year, including the imported and native beans crushed, the oil from which I estimate to yield this year 400,000 gallons. This oil can be used for frying, and for a salad oil in French dressing or in mayonnaise. I fried a partridge in the crude unrefined oil, and found it delicious.

While the chief use, so far, of the oil has been for soaps and paints, the particular object of this paper has been to call attention to the use of soy oil in pharmaceutical preparations. In brief, these experiments show first the necessity of a distinctive test for soy oil. It does not respond to the Halphen test for cottonseed oil, nor the hydrochloric acid-sugar test for sesame oil. It was substituted for cottonseed oil in Camphor Liniment, for linseed oil in Compound Solution of Cresol, for olive oil in Compound Brown Plaster, N. F., and Brown Ointment, N. F., for sesame oil in Ammonia Liniment, with satisfactory results. In Phenolated Oil, N. F., the soy oil used for olive oil became darker after standing several weeks. A Manchurian oil purchased in New York gave these results:¹

| | Specific gravity. | Saponification value. | Iodine value. |
|-------------------|-------------------|-----------------------|---------------|
| Sample No. 1..... | 0.9240 | 194.4 | 131.1 |
| Sample No. 2..... | 0.9244 | 194.9 | 130.9 |
| Sample No. 3..... | 0.9241 | 194.6 | 131.3 |

An ordinary pycnometer was used at 20° Centigrade. The iodine number represents the percentage of iodine monobromide, in terms of iodine, absorbed by the oil. From a sample of mammoth yellow beans we found ash 3.6 percent, oil 21 percent by ether solvent and Soxhlet extraction. No evidence of alkaloids was discovered.

CONSTITUENTS OF SOY BEANS.

The Government and certain state agricultural departments have so extensively treated this subject, in the bibliography cited in this paper, that merely typical analyses will be given.

SOY BEAN MEAL.

| | Moisture. | Protein. | Fat. | Nitrogen-Free Extract. | Ash. | Fiber. |
|---------------------------|-----------|----------|------|------------------------|------|--------|
| Soy bean..... | 7.59 | 44.65 | 8.77 | 27.12 | 5.89 | 5.96 |
| Cottonseed..... | 6.62 | 40.29 | 7.41 | 28.63 | 6.21 | 10.84 |
| Linseed, old process..... | 8.98 | 33.23 | 7.20 | 36.51 | 5.40 | 8.68 |
| Linseed, new process..... | 9.63 | 37.51 | 2.49 | 36.09 | 5.54 | 8.74 |
| Peanut, decorticated..... | 10.73 | 46.84 | 7.91 | 24.34 | 4.89 | 5.29 |
| Sunflower seed..... | 7.68 | 23.80 | 7.94 | 27.49 | 5.03 | 28.06 |

The average oil content of soy beans is 19 percent. While some varieties will uniformly run a little higher, two lots of the same variety will vary from 18 to 21 percent, while occasionally a lot may run a little below 18 percent.

During the past six or seven months there has been produced in this country in the neighborhood of one hundred thousand gallons of soy oil. The largest part of this quantity has been produced in North Carolina by the Elizabeth City

¹ "Investigation of Soy Bean Oil," George W. Byrd, Chapel Hill, N. C.

Oil & Fertilizer Co., Winterville Cotton Oil Co., and the New Bern Cotton Oil & Fertilizer Mills. Samples from the different crushings have been examined in comparison with the imported oils. It was found that the chemical constants of the domestic oils compared very closely with those of the imported oils. A comparison of the chemical constants is here shown from a report of L. P. Nemizek, to Bureau of Paint Manufacturers:

| Identification No. | Specific gravity. | Iodine number. | Acid number. | Saponification value. |
|---------------------------------|-------------------|----------------|--------------|-----------------------|
| FI, No. 9355 (Domestic)..... | 0.929 | 124.3 | 0.8 | 194 |
| Lab. No. 383 (Domestic)..... | 0.921 | 129 | 0.6 | 193.8 |
| Lab. No. 411 (Domestic)..... | 0.924 | 126 | 1.3 | 201 |
| Lab. No. 409 (Domestic)..... | 0.925 | 123.5 | 2.0 | 196.1 |
| Lab. No. 335 (Domestic)..... | 0.924 | 126.3 | 1.2 | 190.4 |
| Imported Oil, FI, No. 8940..... | 0.925 | 123.8 | 1.9 | 190 |
| Imported Oil, FI, No. 9029..... | 0.925 | 133.8 | 3.1 | 190 |

THE UNITED STATES GOVERNMENT'S ESTIMATE OF THE VALUE OF THE SOY BEAN AS A FOOD FOR MANKIND.

In *Farmers Bulletin* No. 121, issued Nov. 19, 1906, prepared under the supervision of the Office of Experiment Stations, on pages 12 and 13, an account of soy beans is given, and the statement made that "In the Orient this bean, and the various food products made from it, are so largely consumed that it is, perhaps, the most important food plant next to rice."

On page 19 of this *Bulletin* we find a comparison of the food values of various food materials, in which we find these analyses:

| Material. | Water Percent. | Protein. Percent. | Fat Percent. | Ash Percent. | Carbo-hydrates. Percent. | Fuel value per pound calories |
|------------------|----------------|-------------------|--------------|--------------|--------------------------|-------------------------------|
| Navy beans..... | 12.6 | 22.5 | 1.8 | 3.5 | 59.6 | 1,605 |
| Soy beans..... | 10.8 | 34.0 | 16.8 | 4.7 | 33.7 | 1,970 |
| Potatoes..... | 78.3 | 2.2 | 0.1 | 1.0 | 18.4 | 385 |
| Wheat flour..... | 11.9 | 10.7 | 1.0 | 0.6 | 75.8 | 1,650 |
| Lean beef..... | 70.0 | 21.3 | 7.9 | 1.1 | .. | 730 |
| Milk..... | 87.0 | 3.3 | 4.4 | 0.7 | 5.0 | 325 |
| Eggs..... | 73.7 | 14.8 | 10.5 | 1.0 | .. | 720 |

MEDICINAL USE.

In England a diabetic biscuit is manufactured. In this country an infant's food from the soy bean is on the market. The enzyme in the bean is also attracting attention and opening a field for investigation. In conclusion, I want to call attention to the necessity of examining the imported seed for plant diseases as the cake is entering into commercial fertilizers and the danger from spreading the meal over land is obvious to those who know the cost of the imported boll-weevil, or the San José scale.

AMERICAN SULPHUR.—HERMAN FRASCH.*

BY M. A. MANSBACH.

To start with, I am neither a scientist nor a chemist, and the excuse which I have for appearing before you consists mainly of the facts, first, that at the present time there is an extraordinary famine in sulphur; second, the revolution brought about in the winning of sulphur by that wonderful chemical and mechanical genius, Herman Frasch, is yet far too little known; and third, the Government states in the *United States Geological Survey Bulletin* No. 666B, that, as a preparedness measure, the sulphur deposits that are now idle should be thoroughly developed, search should be made for new deposits in areas where the geological conditions are similar to those in the vicinity of known deposits, and that other deposits of sulphite ores should be intensely developed.

Sulphuric acid, a government specialist has said, is probably used for a greater variety of purposes in the chemical arts than any other substance. It is made largely from sulphur. This acid and sulphur itself are employed in the manufacture of fertilizers, nitroglycerin, celluloid, powder, matches, fireworks, soap, paper, glass, starch, sugar, molasses, copper, galvanized iron, tin plate, artificial ice, effervescent drinks, shoe blacking, iron, steel, coke and medicine, for vulcanizing rubber, for bleaching wool and silk, for printing calico and tanning and for refining gold, silver and petroleum. It is surprising that no mention at all is made of the use of sulphur as a base for dyestuffs.

Previous to 1895 the method of producing sulphur consisted of digging for it in the same orthodox manner in which we are now digging for coal. This old method was found to be impracticable in this country owing to the great depth of the sulphur deposit, underlying a strata of oil-bearing quicksand. Losses of plants and hundreds of lives occurred until the Government intervened. Sicily at that time had quite a domineering position in the sulphur market. Sulphur is found in and near craters of volcanoes in Japan and Sicily. In Sicily, 35,000 men are employed in the winning of sulphur and this industry is of the greatest local importance. In 1833 sulphur was almost the cause of a war between England and Italy when an English fleet demonstrated in the Bay of Naples to compel Italy to rescind the sulphur monopoly granted to France. Sulphur is also found in Spain and Scandinavia, but not in sufficient quantities to compete with the Sicilian sulphur.

*An address before Scientific Section, A. Ph. A., Indianapolis meeting, 1917. The author was delayed and therefore it was impossible to illustrate the lecture; however pictures of the interior of the plant, sulphur deposits and pumps were shown; also samples of sulphur from the Louisiana, Texas and Nevada deposits.

In 1894-5, when another sulphur crisis threatened to break out in Sicily, the Anglo-Sicilian Company was formed. They controlled between 60 and 80 percent of the entire production and were thus able to pay a yearly dividend of 50 percent and to build up large resources for contingencies. This contingency arose very suddenly when it dawned upon the managers of the Anglo-Sicilian Company that it had to reckon with a new factor in the history of the sulphur production. That factor was Herman Frasch.

Now I might be pardoned to say a few words about this wonderful genius, who lived and was brought up in the same town as myself, who visited the same Latin school and gymnasium in the town of Halle. Soon after Herman Frasch came to America and entered the laboratory of Prof. Maisch at the Philadelphia College of Pharmacy. Industrial chemistry in the modern sense was at that time practically unknown and it was left to Herman Frasch's genius to work out the solution of many problems.

In 1874 he opened a laboratory on his own account and obtained his first patent in the same year on the method of using tin scrap profitably. When he was twenty-four years old, in the year 1876, he discovered the method of purifying paraffin wax. The patent was acquired by Mr. Rockefeller, and the candle and wax paper departments of the Standard Oil Company were the results. One of the most important inventions patented by Herman Frasch was one for the separation and treatment of oil. At that time Canadian oil was selling at \$0.14 per barrel. It contained almost 1 percent of sulphur and had such an offensive odor that when a tanker laden with Canadian oil was lying in the port of New York, the food and butter stored in two adjacent steamers were entirely saturated with the same odor. Big lawsuits followed, and the production of oil in Canada had to be stopped.

Herman Frasch, in 1878, formed the Empire Oil Company, and at London, Ontario, solved the problem by a most wonderful chemical contrivance, introducing copper oxide that entirely absorbed the sulphur contained in the oil and made it as sweet and pure as the best Pennsylvania oil that sold at the time for \$2.25 per barrel. Twenty additional patents were taken out in the years 1887 to 1894. In the meantime the Standard Oil Company had established large oil refineries in Ohio, going to very great expense. They treated the oil in the old orthodox way and the same was returned to them as utterly useless for lighting purposes. They had almost concluded a very large contract to build a pipe line to Chicago to sell oil for fuel purposes when Mr. Rockefeller heard of Frasch's desulphurizing process, which he bought after a thorough investigation. The Standard Oil Company bought the Empire Oil Company and Herman Frasch received shares of stock at 168, which was paying at the time 7 percent. When he had introduced his methods, he sold one-half of his holdings in the Standard Oil Company at 820. Ohio crude oil rose from \$0.14 per barrel to \$1.00 and above. The Standard Oil Company had made millions through this process and was able to raise the dividends from 7 to 40 percent and all the oil producers in Ohio, Illinois and Indiana were greatly benefited.

Among the many other very useful patents that Herman Frasch applied for, I will mention only one. In 1899, a patent was granted to him for an important process to bring to the surface by solution the rock salt reached by boring.

I mention this particularly because that same process has been used in my native town, Halle, Saxony, for hundreds and hundreds of years, and, in view of developments that took place one year later, I might be permitted to ask the question whether or not Frasch's early associations in the old "Salt City" of Halle were not responsible for the millions of dollars he was to make later? October 23, 1890, was the day which was to cause a revolution in the production of sulphur. Sulphur was discovered in Louisiana as long ago as 1865. Men boring for oil in Calcasieu Parish, La., found sulphur under a bed of quicksand several hundred feet thick. Repeated attempts were made to mine the sulphur, but without success. Engineers from France and Austria tried and failed. Herman Frasch heard of the deposit in 1891. He had already melted rock salt with water and had pumped it out of the ground into evaporating tanks. The same process, he thought, might be used in the Louisiana sulphur beds.

Having found and surveyed his golden treasure, Frasch began work on the problem of getting the sulphur out. A bed of quicksand 500 feet in thickness prevented the digging of a shaft. Besides, that method had been tried by others and all the casing had been lost. Moreover, Frasch was busy elsewhere. So several years passed, and then one day Frasch went to work in earnest. A well was driven, after nine months of labor, to the bottom of the deposit of sulphur. The well itself was a 10-inch pipe with perforations at the bottom. Inside that well were three pipes varying in size from one to six inches. In the meantime a battery of boilers had been located on the ground and special machinery invented by Frasch was attached to the boilers for the purpose of superheating great quantities of water.

Orders to fire the boilers were given one morning. When the water was heated to 335° F., Frasch turned it into the well. It ran out of the holes at the bottom of the 10-inch pipe, melting the sulphur, and twenty-four hours later, hot water still pouring in, the pump was started. The pump worked easily at first, but in a few minutes it "took hold" and presently a yellow stream came rushing out of the pipe. All the barrels were filled and then the sulphur was turned into a reservoir that had been hastily dug in the earth near by. The reservoir, too, was soon filled and the sulphur, hot but almost dry, was heaped up until it made a yellow hill. The day drawing to a close, Herman Frasch stopped the machinery and, climbing to the top of the hill, sat down in the sulphur and let it stream through the fingers of his open hand.

He bought the property and organized the company in 1894. It was not until 1903, however, that he obtained sulphur in paying quantities. He brought in 35,000 tons that year. In 1904, he had enough to supply the American market and to ship a cargo of 3,000 tons to France. In 1903, the imports of sulphur into the U. S. were 188,888 tons, the exports none. In 1907, the imports were 20,399 tons, the exports 35,000 tons. The production of sulphur in the U. S. during the year 1880 amounted to 536 tons and the price was \$39.00 a ton. In 1904, the first big year of the Louisiana mine, the production was 128,000 tons; in 1911, 768,000 tons; in 1917, estimated requirements, 1,500,000 tons (600,000 tons short of production).

Government figures give the production of 1914 as having been 328,000 tons and practically all of it came from the southern swamp that Herman Frasch pur-

chased in 1894. At the beginning of his enterprise Frasch had introduced John D. Rockefeller's brother into his company, but, during the long years of hard and unsuccessful work and the beginning of the mine, Rockefeller lost heart and sold his interest out, thereby throwing away a yearly income of between \$250,000 and \$500,000. The real extent of Herman Frasch's wealth did not become known until after his death in Paris. His friends had always thought him a fairly wealthy man, but were amazed at the sensational figures of his millions which were disclosed afterward.

THE HISTOLOGY OF CASTELA NICHOLSONI.

BY C. J. ZUFALL.

Castela Nicholsoni is known in America as *Chaparra Amargosa* (Mexican for "bitter bush") and on the Island of Antigua as "Goatbush." This drug, although not widely known, is of considerable importance in the Southwest where it is employed in the treatment of amebic dysentery. One physician¹ states, "it is the most efficient remedy we have at the present for the treatment of this disease, unless we except emetine."

In 1883 J. L. Putegnat² made a brief study of the drug but did not describe the plant fully or give its histology. He determined the percent of extractives with various solvents and briefly studied the bitter amorphous principle, to which his father, J. L. Putegnat, had given the name "amargosin."

Hooker³ first described the plant, a specimen of which was sent him by Dr. Nicholson of Antigua. Determining that it belonged to the family Simarubaceae and the genus *Castela*, but finding it not to conform to the descriptions of the known two species of *Castela*, he placed it as a new species and called it *Castela Nicholsoni* in honor of Dr. Nicholson.

The following is a translation of Hooker's description of *Castela Nicholsoni*:³

The main stem or trunk not exceeding four feet, much branched; branches provided with short axillary spines; small branches terete, silky-hoary. Leaves evergreen, alternate, sparse, in scattered groups, sessile, coriaceous, elliptical, mucronate, silky-gray beneath and margin revolute.

Flowers small, saffron- or orange-colored, dioecious. Peduncle axillary, short, one- or two-flowered.

Staminate flowers.—Calyx four-parted nearly to the base, segments ovate, variegated, persistent. Petals four, ovate, spreading, deciduous. Stamens: eight, short, hairy, inserted on the fleshy receptacle. Anthers oblong, divided or sagitate and yellow.

Pistillate flowers:—Calyx and corolla, same as in staminate flowers. Ovary: four, contiguous, one or two frequently abortive. Style short or none. Stigmas: four, small, and subulate. Stamens: eight, short, abortive, hirsute and adherent. Drupes: four, subglobose, base acuminate or short pedicelled, small, purple or red when mature. Nut compressed, ovate, bivalved, rugose, unilocular. Seeds suspended, sub-ovate, compressed. Albumen small, thin, flesh-colored. Embryo almost as large as the seed. Cotyledons straight, foliaceous.

Dr. Nicholson observes that "it is a beautiful little shrub, especially when in fruit. It is found growing in the utmost luxuriance in an arid calcareous soil where everything else is burnt up."³

In America it is found in "southwest Texas and northern Mexico growing on thin, rocky, mesquite or post-oak land, and having an especial tendency to be found on small rocky hills."¹

Elements found in powdered *Chaparro Amargosa*: St, stone cells, P, parenchyma cell of pith; Ca₁, calcium oxalate from leaf; Ca₂, calcium oxalate from root bark, S, starch grains, H, hair; T, trachea; W, wood fibre; M, medullary ray cell; K, cells from cortex, one containing a monoclinic crystal of calcium oxalate; B, bast.

Chaparro Amargosa. Transverse section of stem: E, epidermis; K, cork; Ph, phellogen; P, parenchyma; B, bast; St, stone cell; F, phloem; M, medullary ray; X, xylem; L, lignified parenchyma; S, starch.

Chaparro Amargosa. Transverse section of root: K, cork cells; Ct, cortex; S, schizogenous cavities filled with a yellowish mucilage; St, stone cells, C, cambium; W, wood fibres, T, trachea, M, medullary ray.

It is also mentioned as being found on bluffs along the Rio Grande and its tributaries.⁴

The drug consists of the entire plant, all parts of which contain the bitter principle.¹ The stems reach a length of 12 dm. and a diameter of 15 mm. They are rough, of an ash-gray color and frequently covered with lichens, while the branches are covered with hairs and tipped with sharp points. It is very hard and the fracture is very tough and splintery. If cut smooth, the end shows a green bark about one mm. thick, the light-yellow wood has several rings of darker wood-fibres and the pith is about one-tenth the whole diameter.

The root is much larger than the stem, having a diameter of 20 to 45 mm. It is twisted and irregular in shape and covered with a rough, gray and cinnamon-brown

bark which is furrowed and sometimes 6 mm. thick. In transverse section this bark shows a radiate structure, the rays being undulate which is characteristic and aids in distinguishing this from other hard and tough roots used in medicine. The wood is similar to that of the stem.

The dry drug has no odor but upon soaking in water an unpleasant nauseating odor develops.

Microscopically the transverse section of the stem is quite interesting and has a characteristic structure. The epidermal cells have very thick outer walls and some of the cells are modified to form non-glandular hairs in which the lumen is almost indistinguishable. There is a sub-epidermal layer of cork containing stone cells; then the phellogen, phelloderm and primary cortex followed by a thick layer of bast in which are many stone cells. Between this and the wood is the peculiar phloem. The xylem consists chiefly of wood fibres, tracheae being very

Chaparro Amargosa Transverse section of leaf U E, upper epidermis, W S, water-storage cells; I, idioblast containing a rosette aggregate of crystals of calcium oxalate; P L, palisade cells; P a, parenchyma, H, hypodermal layer, L E, lower epidermis

few. The medullary rays are one to two cells wide and contain starch. The pith contains much starch and is made up of thick-walled polyhedral cells whose walls are lignified and marked with narrow slit-like pores.

The leaf is typical of the Xerophytes, being very small and well protected by a thick-walled epidermis and on the ventral surface by many hairs similar to those of the stem. Beneath the upper epidermis are two rows of large, thin-walled water-storage cells similar to the corresponding structure of the leaf of *Ficus elastica*. The palisade structure is made up of three or four layers of very narrow cells, among which are found idioblasts containing calcium oxalate in rosette aggregates. The parenchyma is compact, with small intercellular spaces, and next to the lower epidermis is a distinct layer of what may be called hypodermal cells.

Powder: -Starch grains abundant in pith and medullary rays; grains angular or spherical; four to nine microns in diameter, point of origin central, indistinct,

not cleft; lamellae indistinct. Medullary ray cells have thick walls marked with many simple pores. Calcium oxalate in large monoclinic and twin-form crystals; in root bark abundant. A few rosette aggregates from the leaf. Stone cells many, square, rectangular, irregular and with thick walls. Parenchyma cells of pith large, walls thick, lignified and marked with small circular pores. Tracheae few with spiral markings. Bast fibres abundant, long with very narrow lumen. Wood fibres abundant. Non-glandular hairs with very narrow lumen. Leaf fragments few.

THE SIMULATION OF DISEASE.

Reprint No. 433 from the *Public Health Reports* was issued November 9, 1917. This was prepared by A. G. DuMez, technical assistant in the Hygienic Laboratory, U. S. Public Health Service. In this paper some of the many methods employed for effecting simulation of disease by the use of drugs, chemicals and septic materials are given. The subject is of considerable interest at this time and its study is of some importance to pharmacists, in view of the fact that the services they may be called upon to render will include investigations of this kind. It is surprising to note the many means that are employed for inciting conditions that simulate diseases and the knowledge that must obtain with some of these methods. The substances enumerated in this paper are grouped under the diseases, the diagnostical signs of which their use is to simulate. Brief outlines of the methods recommended for the detection of these frauds are also included, where specific information of this kind has been available.

The divisions are: Substances used in simulation of diseases of the skin and subcutaneous tissue; of the eye; of the ear; of the throat; of the respiratory system; of the digestive system; of the circulatory system; of the kidneys; of metabolism and other diseased conditions. As an example for simulating eczema: After abrading the skin by scraping with a sharp-edged instrument or rubbing with some rough material, one or more of the following are applied: Croton oil, sulphur, acid substances, oil of cade, ointment of mercury, or mezerium bark. For detection, according to Blum (1916), the eruptions produced may be distinguished from those of the true disease by the fact that they are disseminated and do not form confluent masses. Furthermore, the skin, after the removal of the crust, does not appear red, dry, and hypertrophied, as in true eczema.

It is surprising to note the extent to which these men will go in applying injurious substances to bring about simulation of diseases. The results from some of these are doubtless apt to be permanent and remind them hereafter of their attempt at deception.

Quite a lengthy bibliography follows and reprints may be obtained from the usual source, namely, Superintendent of Documents, Government Printing Office, Washington, D. C.

SECTION ON EDUCATION AND LEGISLATION

PRACTICAL DRUG STORE EXPERIENCE BEFORE ENTERING COLLEGE.*

BY OTTO RAUBENHEIMER.

"All things must change
To something new,
To something strange!"

Longfellow--Keramos, L. 32.

Thirty years ago, when the writer entered a college of pharmacy, there was no prerequisite clause of one or more years of high school education. Nevertheless, the pharmacy students at that time were of a different type and of a better class than those of to-day. Many of my fellow students were graduates of high schools or similar institutions, and with pride do I look upon the members of the "Blizzard Class" and join their annual reunions. Thirty years ago in the good old times the student was not required to possess any "counts," *but he was compelled to have two years of practical drug store experience before entering a college of pharmacy!* The object of my paper is to point out the advantages of such professional training in a pharmacy before entering college, and I will divide them into four parts.

I. LOVE FOR PHARMACY.

How frequently, how very frequently, does it happen that a young man is advised to take up pharmacy, enters a college and after the short time of a year or so, takes up another profession or business. A pharmacist's bed is not one of roses and if it is, then they have plenty of thorns! The apprentice should first of all become familiar with the "ups and downs" in the life of a pharmacist. Only those who truly love pharmacy will stick to it. The apprenticeship is a true test for fitness, and these "survivors of the fittest" are the proper material for pharmacy students and for future pharmacists!

II. PRACTICAL TRAINING.

The apprentice who is employed in a drug store, in which pharmacy is practiced and prescriptions are compounded, is bound to obtain some practical knowledge. I know I did and thousands of others did the same. I do not refer particularly to the sweeping or mopping of the floor or the cleaning of mortars and graduates, although even such work and "knowing how to do it" is of benefit to the future pharmacist. In cleaning the shelf bottles the apprentice becomes familiar with the appearance of the drugs, chemicals and preparations, including their odor and even their taste, and besides this is learning the pharmaceutical nomenclature. He also becomes familiar with pharmaceutical apparatus and operations, a very important factor.

Right here I want to answer the criticism which will surely be made, namely: "In some stores the apprentice will receive no training and in others he will get a

* Read before Section on Education and Legislation, Atlantic City meeting, 1916.

wrong training." If there are any such so-called pharmacies then they should not be classed as such. Besides that, the apprentice will soon discover these things and will look for another, *real preceptor*.

III. COLLEGE EDUCATION.

"A little knowledge is a dangerous thing!" However it is better than none, especially in pharmacy.

Imagine a pharmacy student who has never seen a mortar or pestle, who has never heard of the U. S. P. or N. F., who does not know how to hold a graduate, and who has no idea of the approximate weight of a kilogramme or a grain. It is extremely difficult to teach such a student, even in the well-equipped pharmaceutical laboratories of our colleges! The time is too short at least in a two-year course, as at present.

A student with practical drug store experience has a very great advantage over his fellow-student, who lacks this, in being able to understand the lectures and to benefit by the quizzes and laboratory work.

IV. STATE BOARD EXAMINATION.

Most colleges of pharmacy admit the student at the age of seventeen and consequently graduate him when but 19 years old. This graduate is *supposed* to spend two more years in a pharmacy, which together with his two years of college training will give him a total experience of four years. By this time he will also attain the age of twenty-one, required by the State Board before taking the examination.

Theoretically, very good! However, practically no good! The graduate who follows this example and who works in one of the commercial drug stores of our age, will surely forget pretty much all he learned in college and will not pass the State Board examination, if same is strict, as it should be. This is one reason why we have so many Ph.G.'s who are not licensed pharmacists.

I can not help to state here that the required 4 years' experience is frequently faked by false affidavits, and it is therefore the duty of every State Board to inquire into this serious matter.

Two years of practical drug store experience *before entering college*, together with the college course and sufficient time in a pharmacy to make a total of four years, would certainly be an ideal condition. For this reason the two years of experience before entering college is a check on the practical training.

I have given this matter serious consideration and have as a result added the following paragraph in the catalogue of the College of Pharmacy I am connected with:

PRACTICAL EXPERIENCE.

Inasmuch as the candidate when taking the Board of Pharmacy examinations in most all the States of the Union is required to have four years of professional training in a retail pharmacy in which prescriptions are compounded it is very desirable that the student, *before entering the College, should possess some practical drug store experience.*

Such practical experience will also serve as a foundation upon which the student can build a solid structure. From the observance of our professors and instructors those students who are apprentices in a pharmacy can very readily comprehend the lectures and the laboratory work.

CONCLUSION.

Have we not wandered on the wrong road in our pharmaceutical education? Have we completely forgotten that excellent apprenticeship of old?

Do not let us educate "paper pharmacists," students who only look for a degree, but let all the colleges of pharmacy require practical experience as one of their entrance requirements!

ABSTRACT OF DISCUSSION.

L. E. SAYRE: When I first went to Kansas, I insisted upon practical experience, and that the statements thereto should be certified. We found, even under these conditions, that the reports could not be relied upon. The final decision arrived at was that it made no difference whether the students obtained their experience before or after college attendance.

As an instructor, my preference is for practical store experience after college attendance; too many young men come to school, after store experience, imbued with an idea that much of what is taught is unnecessary, or that they already know, and as a result they do not develop into good students.

If we could select the stores and the preceptors then it would be a different matter, but as a rule the experience of the clerk is not conducive to the making of a good pharmacist.

A MEMBER: It seems to me that a clerk is bound to learn something of value for his studies, and that it should be an easier matter to teach the one with some experience than one without any.

JOSEPH WEINSTEIN: I quite agree with Prof. Sayre, but only in part; most of the young men in the stores of New York are necessitated to gain experience that will be of value to them in school.

H. C. CHRISTENSEN: Speaking from personal experience, I had advantages over my room- and classmate, who had a better preliminary education, because of my store experience. I thought the matter of experience had been given approval long ago.

JULIUS A. KOCH: Educational institutions are acknowledging that practical experience is the best education; schools in engineering send their students into the machine shops. Pharmacy adopted the idea long before other technical schools thought of the value of practical experience. Are we going to give up this plan now?

IOWA'S PREREQUISITE LAW.*

BY J. M. LINDLY.

In considering Iowa's Prerequisite Law on this occasion, it is not necessary to enter into a detailed history of pharmacy in Iowa, although a few brief references thereto may be desirable.

The Pharmacy Law of Iowa was enacted in 1880. It has undergone several modifications during the thirty-seven years that have followed, but the essential features have continued to the present time. The administration of the law was placed in charge of the "Commissioners of Pharmacy," three in number, one of their duties being the licensing of those who wish to enter the practice of pharmacy. The original law provided for the licensing of all who were in the drug business at the time of the passage of the law. Subsequent admission was to be by two methods, either by examination before the commissioners, without regard to experience; or, without examination, on the presentation of a diploma from "an incorporated college or school of pharmacy" that required four years of experience

* Read before Section on Education and Legislation, A. Ph. A., Indianapolis meeting, 1917. (See also "Iowa Prerequisite Law," p. 928, October issue, 1917.)

including the time at school. These two methods of admission continued, with slight modification, until 1906, when all applicants for registration were required to pass a satisfactory examination before the commissioners of pharmacy. The change in 1906 provided that "Graduates of reputable pharmaceutical schools and colleges whose entrance and graduation requirements are equivalent to those prescribed by the American Conference of Pharmaceutical Faculties, for the year 1905 (this last phrase later eliminated), and whose course of study consists of two years of not less than thirty-six weeks each, shall be eligible to take the examination without proof of experience as hereinbefore defined." All others taking the examination must show four years of experience.

This change of 1906 did not prove to be entirely satisfactory. The graduate was regarded as competent professionally but deficient commercially. The licentiate, prepared in the school of experience, was considered as competent commercially but deficient professionally. In recent years, at the meetings of our Iowa Pharmaceutical Association, considerable discussion has been indulged, informally, concerning this subject. This discussion reached the point of concrete action last February while our association was holding a mid-winter meeting in Des Moines, at which time a resolution was unanimously adopted favoring the so-called prerequisite law or idea. Accordingly, some of the officers of our association, with the counsel of an attorney, who had formerly been an assistant in the Attorney-General's office, prepared a bill which was introduced by myself in the Senate, March 15th, known as Senate File No. 548, and which passed the Senate April 4th and the House of Representatives on April 12th, and went into effect July 4th of this year of 1917.

The most important feature of this bill is the requirement that all who would aspire to take the examination for registration as a pharmacist must have the prerequisite qualification of having "successfully completed the work of two college years in a reputable school or college of pharmacy," and have had two years of actual experience in a drug store. This "reputable school or college of pharmacy shall be such school or college of pharmacy whose entrance and graduation requirements are equivalent to those prescribed by the American Conference of Pharmaceutical Faculties for the year 1917."

What are the entrance and graduation requirements of such a school? Although it is presumable that the most of you are familiar with these particulars, it may be of interest to someone that these be here stated. Turning to page 203 of the Proceedings of the Seventeenth Annual Meeting of the American Conference of Pharmaceutical Faculties, we find (1) "The institution shall require of each candidate for graduation not less than 1200 hours of instruction, of which at least 500 hours shall consist of lectures and recitations. Such work to be given in a period of not less than fifty weeks, occupying not less than two full college years, and at least two months should elapse between these two years;" (2) "The requirements for admission of students to the school or college as candidates for any degree shall be: (a) A minimum age of seventeen years, except when the candidate is a graduate of an accredited high school or of an institution of equal grade, in which case no age limit shall be demanded; (b) Evidences of the satisfactory completion of education beyond the eighth grade equivalent to 15 counts

shall be required of each student. A count shall consist of one-hour instruction per week for a school year of 36 weeks," etc. This would mean the completion of the 9th grade in the public school as one of the requirements for entrance into the school of pharmacy.

The new law may be regarded as a compromise between the extremes found in the preceding law. Instead of four years of experience being required of the applicant who was not a graduate in pharmacy, only two will be required, and that will now be required of all, even of the graduate. Another provision, the aim of which is the easy adjustment of the new law to present conditions, is that any unregistered person who was clerking in a drug store at the time the law went into effect shall be allowed to complete his four years of apprenticeship and take the examination.

It may be asked why the first attempt to secure the enactment of the prerequisite law in Iowa was successful? This success may be ascribed to several facts and considerations. (1) Its advocates had a good talking point inasmuch as the Iowa statutes already required a much higher prerequisite educational standard for admission to examination for practicing medicine, law, dentistry, and even of veterinary medicine, than had been previously required of the pharmacists. Even this new pharmacy law does not come up to the standard set for some of these other professions. The proposed change sought in the pharmacy law was only an attempt to conform to the general spirit and letter of the Iowa statutes. It was only in keeping with the spirit of the times. (2) The Iowa Pharmaceutical Association is a strong organization. There are about 1700 drug stores in the state and there are about 1700 members in the association. The association is greatly aided in securing and in retaining members and in keeping alive a wholesome and active enthusiasm by two strong auxiliary organizations, one being the Iowa Pharmaceutical Travelers' Association, organized in 1908, and the other is the Iowa Druggists' Mutual Insurance Association, also organized in 1908. In the association itself is a legislative committee composed of one member from each county in the state. Besides this committee, there is the executive committee of three members, and there is the advisory board of eleven members, being one from each congressional district. All three of these committees may work in conjunction on legislative matters. By having a member of the legislative committee from each county, the committee has an extensive personal acquaintance with the members of the legislature. The influence of personal acquaintance is thus carried to the extreme. In connection with organization, it may be mentioned that during the last ten years there have been at times as high as sixty-five local N. A. R. D. associations or units, being city, town or county organizations. These, of course, were centers of influence. (3) A Bulletin, issued monthly by the Association, placed important information directly in the hands of the druggists of the state. If action was sought, direction was thus given to the rank and file. (4) During the past winter, fortunately, there were four members of the legislature who were registered pharmacists, three in the Senate and one in the House of Representatives, who gave their personal attention to such legislation as pertained to the affairs of the pharmacist. The chairman of the committee on pharmacy in each house was one of these pharmacist members.

ABSTRACT OF DISCUSSION.

W. C. ANDERSON: This is a very important paper because it teaches a very valuable lesson in the methods of securing prerequisite laws. In the first place, Iowa presents a very thorough pharmaceutical organization. I believe the paper states that practically every druggist in Iowa is a member of the State Pharmaceutical Association. There is the first foundation for successful work. The rest of the states are interested in knowing how Iowa does it, and I believe the fact that it has been accomplished in Iowa is an incentive to the workers in other states who place that as one of their ideals—every pharmacist in the state as a member of the state association.

The next important lesson that this paper teaches is that if we want to secure results in prerequisite legislation we must meet the conditions as they appear to-day, and not attempt to look into the future, some 10, 20 or 30 years, and legislate for what we would like to see pharmaceutical education at that time. The mistake that too many states are making to-day in trying to secure prerequisite laws is that they are striving for four years of high school for entrance, as part of their prerequisite requirements. They are paying no attention to the hundreds of boys in the state who have entered into the drug store life with the prospect of becoming licensed pharmacists, but cast them aside and say, "You have to come under these conditions the moment the law goes into effect." They are saying, "All your apprenticeship is lost practically, so far as the educational part of it is concerned, and you must go to a high school, and graduate from there before you can enter the practice of pharmacy."

Therefore, if we will take a lesson from this and make provisions for those who have entered pharmacy, the same as this bill does, and then make our entrance requirements to meet the present conditions of the drug business, rather than what we would like to see, perhaps we will be more successful in securing prerequisite legislation. This is a very valuable paper, and the druggists throughout the country, in states where there are no prerequisite laws, will appreciate having this information of how Iowa has been able to do it!

C. B. JORDAN: It strikes me there is one weak point in the law. That is, the standard is that of the Conference for 1917. Before that can be changed, even though the Conference changes its standards, that of the Iowa law remains the same until amended.

R. B. BIRD: It is a mighty fine thing if we keep up to date, let the future take care of itself. When it comes to enacting laws the greatest compliment, it seems to me, we can pay the Iowa people is that they are up to date.

C. B. JORDAN: You misunderstood my contention. Indiana will be glad to get anything. But this law specifically imposes the standard for 1917. That can not be changed without an amendment. My idea is to let the Board fix the standard, or simply adopt the standard of the Conference, without designation of the year, then the advancing standards would become effective.

C. M. WOODRUFF: The present-day tendency, you know, is to exaggerate the importance of vocational training at the expense of the importance of a liberal education. It seems to me the time will come, and perhaps has come, when you will have to have a prerequisite to the entrance to a college of pharmacy. You know in our high schools we have now selective courses. We have also selective courses in our colleges, and it is possible that a person can come through a high school, can even be a graduate of a college, without having a proper preliminary education qualifying him to enter a college of pharmacy. What shall an applicant for admission to a college of pharmacy be required to know before he is supposed to be qualified to enter upon the study of pharmacy?

THE CHAIRMAN: In reply to that, Mr. Woodruff, I want to say that the members of the Conference of Pharmaceutical Faculties have been working 19 years now to determine what should be the proper entrance requirements to a college of pharmacy.

C. M. WOODRUFF: They ought to know by this time.

W. C. ANDERSON: Just one word with reference to Professor Jordan's remarks as to the advisability of states framing their prerequisite laws along lines so that they always would come up to the requirements of the Conference. I believe the Iowa people have acted wisely in specifying the year of those regulations by the Conference. It is a very dangerous thing for any state to enact a prerequisite law providing that the requirements shall be such as are provided by the Conference, without any other specification. You can not know what these requirements will be, or whether they will be advisable to adopt.

J. M. LINDLY: In reference to the standard fixed for 1917 by the Conference, one reason was that the legislators might know something definite of the proposed standard. When an effort was made to defeat the bill, I went to the Governor myself and took this report along with me and showed him what this standard was.

Just one word more, and that was suggested by Dr. Anderson, and that is we do not wish to ask our legislators for something too radical. We have to meet the present conditions. Our situation in Iowa may be different from what it is in any other state. Our old laws were, perhaps, a little different, and we have to make the change in such a way that it will not seriously inconvenience the people or the druggists. There was an objection to the bill and that was it did an injustice to the poor boy. That is the reason for one clause of the law, allowing these boys, who had started in to clerk and put in their four years' apprenticeship, and those who were thus engaged at the time the law went into effect, to go on and complete the four years, and then take the examination. We do the best we can, all the time trying and striving upward. If we can't get all we want, we get what we can.

THE CHAIRMAN: The bill, as it was originally written, did not say the standards as set forth by the Conference of 1917, but it simply said the standards of the Conference of the Pharmaceutical Faculties. The reason the "1917" was put in was because we felt that we would not be able to pass the bill unless we put in a definite statement, as Senator Lindly has already pointed out. It is a weak point in the law.

W. F. RUDD: We have always to consider the reactionary forces in any community in which we live. We have them in Virginia, and those reactionary forces, while in the minority, somehow or other they manage to stand in the way of good legislation and block it before it gets real headway. It seems to me it is eminently right, that instead of providing a future standard, to have one adapted to present conditions and specific, as in the Iowa law, is best.

IOWA PHARMACEUTICAL ASSOCIATION.

The newsy monthly of the Iowa Pharmaceutical Association contains the following appeal to pharmacists, encouraging them in furthering the passage of the Edmonds Bill (H. R. 5531):

PHARMACISTS' ATTENTION.

All over the country there is a feeling that pharmacists are entitled to greater consideration in the government service than has been accorded them in the past. It is impossible under present rules and regulations for a pharmacist to rise to commissioned rank in the Army on the basis of his pharmaceutical training and service. Conditions in the Navy are somewhat better, but the full rank of lieutenant or higher grades are not accorded those who rise from the ranks in the hospital corps.

No better opportunity than the present emergency has ever presented itself for the organization of a Pharmaceutical Corps officered by pharmacists and offering to the enlisted personnel, opportunities for advancement to commissioned rank.

The Government needs a Pharmaceutical Corps right now.

The people are entitled to proper pharmaceutical service in military as in civil life and will demand it.

The problem of securing the passage of the Edmonds Bill is now squarely up to the pharmacists of the country, and every druggist should write personal letters to his Congressional representatives urging the establishment of a Pharmaceutical Corps. Pharmaceutical organizations should hold special meetings if need be to draw up resolutions endorsing the measure. Active and energetic support of the Edmonds Bill is a duty that every pharmacist owes to his profession and to our armies in the field.

WOMEN'S SECTION

TEACHING THE PUBLIC.*

BY ZADA M. COOPER.

In selecting a subject upon which to write a paper I was unable to get away from the idea that we ought to undertake some definite thing each year or, perhaps, for a period of years. There ought to be concentration of effort; scattering our energies either brings no results or at best no tangible ones. We do not know what we are accomplishing or that we are accomplishing anything; the results are lost to us. Enthusiasm and interest are reduced to a minimum. Filled with the idea that we should adopt some definite plan and bend all our energies to accomplish the end sought, then I was confronted with the question what that one thing ought to be. This was no small task for as I have said before at these meetings, said until you are tired of hearing it, I fancy, the number of causes in which we might enlist are legion.

In the general work of the world there are many tasks for which women have leisure that men do not. Our grandmothers did everything for their households but factories and wholesale establishments have taken over many of those duties. It has been a natural evolutionary process but it has left many women unrealizing what has happened and it was responsible for much of the unrest among women during the last generation. Even yet we have not all found ourselves. The necessity of laboring for a livelihood has been a blessing to many of us. Some have had leisure which has not always been used to the best advantage and they have drifted into what Professor Ross calls "competitive ostentation." Surely the woman with little or much leisure owes it to herself and to other women and to the race to employ that leisure in some constructive work.

Then, too, there are many tasks for which women are peculiarly fitted. They have a little different view-point and this is no less true of things pertaining to pharmacy than of civics or politics. Every question to be well rounded out needs to be worked out from women's point of view as well as men's. *You* see phases of *your* druggist's problems that he can not see himself. *You* stand between him and the public. *You* are a spectator but you are *not* disinterested. *You* are sufficiently detached to have a better perspective. *You* hear the comments of other women, *you* know what the public complains of, *you* know both sides of the question.

After this long preamble which I suppose amounts to an attempt to justify my choice of work for the Section to undertake, I shall try to be specific.

The educational or publicity campaigns undertaken by several state associations during the last two or three years have appealed to me very much and it is some such work that I should like this Section to take up. The public needs education about the pharmacist and pharmaceutical things. Almost every phase of the profession about which the public has any idea, now, needs explanation both for the good of its individual members and for the benefit of pharmacists themselves. There is altogether too much misunderstanding and ignorance among people generally because until comparatively recent years it seemed to be the

* Read before Women's Section, A. Ph. A., Indianapolis meeting, 1917.

accepted policy to keep them in ignorance about everything that pertained to medicine. Not every sort of pharmaceutical subject can be handled by the Section because the membership is so largely non-professional but there are plenty of them that can be.

Most of you write papers for clubs and there can be no reason why you can not write papers about things affecting pharmacy. Consider a few of them. You know the pros and cons of Sunday closing, the advantages of shorter hours, the harm in much of the advertising, the evils of patent medicines. You know the menace of the drug peddler, you know why it is better to buy drugs at a drug store instead of a department store, you can boost prerequisite legislation. All these and many more you are prepared to discuss intelligently. Whatever you do toward educating the public reacts for the good of pharmacy professionally and financially. One thing especially fine you can do and, perhaps, you only and that is to teach the public to demand women behind the counter as well as men. If the women demand women druggists the men will see as they have not seen before their value as business getters. The value to the business man is not secondary to the service rendered to women druggists.

Two state associations have been doing very notable work with their educational bulletins or, perhaps, I should say I know about such work in two states. Perhaps others are doing just as much. I refer to Pennsylvania and Minnesota. Some of the subjects that these states have treated will show you, I believe, that you too may have valuable suggestions to offer. Notice carefully the following subjects: Instances of how the pharmacist serves the public, Fraudulent advertising of proprietary medicines, Formula disclosure bills, Coupons and trading-stamp legislation, Pharmaceutical service—its seriousness and responsibility, High prices encourage drug adulterators, The consumption of drugs, Beware of quacks—buy of druggists, Advance in drug prices, Unrestrained sale of drugs scored.

I do not know what machinery would be necessary to put such a plan as this into operation and to keep it working successfully. I have wondered if it might not be undertaken by the Press Committee even though it may differ somewhat from the work usually expected of that committee. Or, if it seemed wise a special committee might have it in charge although in general I believe there is serious objection to multiplicity of committees. Should this be delegated to the Press Committee, the scope of articles would be very much broadened. Instead of being limited as it is now to articles about the Women's Section or those of interest to women of the Section they would have the task of getting papers on any subject appropriate for this publicity and educational work. These papers might be offered to drug journals with the suggestion that every druggist try to get them published in local newspapers. However, it seems probable to me that it would be far better if they could go through the hands of the regular state association committees because of their having a well-organized machine for handling them. I am, of course, assuming that these publicity committees of state associations would use such articles when offered them. Perhaps they wouldn't but I can not help feeling sure that they would if the articles were well written and timely. I suppose there is a great quantity of material written that never gets printed but really good things, I believe, are not often refused. The author of the article and

the Women's Section would both receive credit. We should know that we were doing something definite. Our Press Committee might go a step further if it seemed best and instead of soliciting papers to come at any time on any sort of subject a special list might be prepared for each month or every three months. Such a list might, perhaps, be published in the JOURNAL or sent out in any other way that seemed best.

This whole notion of mine may be altogether visionary. Perhaps it can't be done. Perhaps it isn't even a good thing to attempt. I have not discussed the subject with anyone but I hope that it will be discussed freely even if the discussion should be mostly criticism. If there is any value in it then others may have better ideas of how it might be carried out.

CHEMISTRY OF THE HOUSEHOLD.*

BY MARY L. CREIGHTON.

The chemistry of the household deals very intimately with many important topics among which are the air we breathe, the food we eat and the best methods of preparing and preserving it, the selection of cooking utensils and their proper care, choice of textiles with reference to "fast colors" and effect of certain dye-stuffs upon the fabric, bleaching agents and stain removers, chemical agents for the softening of "hard water," the selection of both toilet and laundry soaps, the problems of artificial light and heat, etc., etc. Under the head of food materials attention must also be given to the character of the various condimental and flavoring agents and baking powders. In fact, the domestic applications of chemistry are so many and so varied that it would be impossible, within the limits of a brief paper, to even refer to them all.

One of the most important subjects which claims attention in the household is the securing of an abundant supply of pure air by means of proper ventilation. We are proverbially careless in regard to providing our homes with an abundance of oxygen—which we know to be as essential as food—but because it may be had for the taking and is not obtained through the medium of the check-book we do not appraise at full value.

Next in importance to fresh air is the food we eat. The principal classes of organic foods are the fats, the carbohydrates—starches and sugars—and the proteids, of which last nitrogen is the essential element. The function of protein is the building and the repair of body tissues, hence animal life can not exist without it. The supply is obtained from lean meat, eggs and some kinds of vegetables.

As a nation we use an excessive amount of protein, a fact which has led to the construction of tables showing those combinations of fats, carbohydrates, minerals, acids and protein which will give most satisfactory results in keeping the human machine up to the highest point of efficiency by meeting its special requirements. The selection of foods must, of course, be governed very largely by circumstances, the industrial worker requiring not only different food materials but a larger amount than the brain worker who takes but little physical exercise.

The scientific training in household science which is now recognized as a factor in the practical education of thousands of young women, and the increasing

*Read before Women's Section, A. Ph. A., Indianapolis meeting, 1917.

general interest shown in this subject during recent years are hopeful signs for the future, since such a course of study has as its very foundation a knowledge of the chemistry of foods as it applies to their selection and preparation. Never before in the history of this country was such attention paid to the question of foods and food values. We hear constantly of the "balanced ration" and of the necessity for a thorough understanding of the chemistry of foods in order that the body may be well nourished with a minimum of expense.

This subject leads naturally to that other one, What garden vegetables are most profitable from the dual standpoint of food value and money value? Also, what crops are best adapted to certain kinds of soil, and how best can the fertility of the soil be maintained by the replacement of chemical substances which have been removed by growing crops? All plants require a sufficient amount of the elements hydrogen, oxygen, carbon, nitrogen, sulphur, phosphorus, calcium, magnesium, potassium and iron, while still other elements are essential to certain kinds of plant life. The fertility of American farms and gardens must be maintained, or restored, in order to provide the largely increased food supply which the times demand.

We have heard much in the past of "intensive farming," but the summer of 1917 has shown a marvelous increase of interest and enthusiasm in this direction, especially among amateur gardeners. Thus the school boys and girls of to-day are learning in a very practical way that chemistry, instead of being a subject of study to be feared and dreaded, is their strongest ally in the partnership with nature upon which they have entered.

The attitude frequently assumed by students toward this highly interesting and valuable branch of their scientific training reminds one of the story of the small boy who, when walking along a lonely road, saw a ghost-like object ahead which, when bravely approached, proved to be a friendly guide-post.

There are comparatively few lines of work in which a knowledge of chemistry and its practical applications will not prove helpful. In addition, the thousands of so-called school gardens are destined to teach their owners far more than mere soil adaptability and how many crops can be harvested from a small plot of ground intelligently planted and tilled. There will be other lessons of thrift, industry and economy that will prove valuable assets both to the individual and to the community in which he lives.

Following the choice of foodstuffs, the chemistry of cooking deals with the best and most practical methods of preparing the different articles for the table, and necessitates a working knowledge of the nature of the materials to be dealt with and of the object sought in their treatment. This is a subject of such extent and importance as to place it in the front rank of household interests.

The purposes of cooking are, to render food palatable by improving its flavor, to aid digestion, and in general to make it more healthful, the particular method employed depending upon the final object to be attained. For example, a broiled steak retains its juices, while if it is desired to extract them the meat is placed in cold water and cooked slowly.

Of the many different ways in which the winter's supply of fruits is cared for—drying, canning, preserving and the making of jams, marmalades and jellies—the last named is usually considered the most difficult. However, with a proper

understanding of the conditions which must be met, jellies of all kinds may be easily prepared.

Careful experiments have made possible the formulation of certain rules for procedure in the handling of fruit juices. These must contain *pectin*, the constituent upon which the process of jelly-making absolutely depends, and if it is shown by a simple chemical test with ethyl alcohol that pectin is not present it must be supplied.

Fruit juices which are both acidic and rich in pectin, as grape and currant, offer the least difficulty, and for these the old-time method of measure for measure of sugar and juice may be safely employed, the amount of sugar necessary in any case depending upon the proportions of these constituents present.

The bread required for the household is a matter of prime importance, especially the quality of the flour from which it is prepared.

The consideration of the questions of a pure water supply and of pure milk are problems for the community rather than for the household.

A knowledge of the chemical composition of metallic cooking utensils will enable the user to select such as are least liable to corrosion, and also aid in the application of effective cleansing agents not likely to be destructive to the vessel itself.

We have been accustomed to think of graduated glassware as belonging to the equipment of the chemical laboratory, but graduated measuring vessels of glass are now at home in the modern kitchen cabinet. From the sanitary point of view, it is also interesting to note that the glass mixing spoon and glass rolling-pin have largely replaced those made of wood, and that a plate-glass slab now offers a great improvement over the old-time moulding board, while the chances are that pastry prepared on this slab, with an ice-filled glass rolling-pin, will be baked on a glass pie-plate in an oven so constructed that the process is open to inspection.

Many grades of ware, for which we are largely indebted to the chemist's art, find use in the household, from the coarser pieces of stoneware to the decorated china table service of delicate pattern and design. Perfect glazing is a necessity for table ware, and the addition of certain chemical compounds to the glazing material has made possible the varied and beautiful tints now shown in the better grades of porcelain.

While the shortage of dyes formerly imported has been the cause of considerable apprehension, the recent displays of bright-colored fabrics has seemed to be unusually large and indicates that members of the household will not of necessity go clad in sombre garments. And the pride exhibited by the people of the United States in using and wearing, as far as possible, articles "Made in America" goes to show that this country is not likely to take any backward steps along these lines, even should the hoped-for time soon come when it would no longer be essential that we depend upon home manufacturers for the commodities hitherto obtained from abroad.

In conclusion: The chemistry of foods is evidently a subject which has come to stay in the American home, and let us hope that its wise study in our schools and its general application to daily needs will exert an influence upon the public health that shall be lasting in its benefits.

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Editor on the day following the meeting, if possible. Minutes should be *plainly* written, or typewritten, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

CITY OF WASHINGTON.

Most of the time of the October meeting was devoted to a detailed account of some of the activities of the parent Association at the Indianapolis meeting, and of the section of pharmaceutical chemistry of the American Chemical Society at Boston.

On December 5th Mr. Frank Rabak of the Office of Drug Plant and Poisonous Plant Investigations of the Bureau of Plant Industry gave an interesting illustrated talk on the development and future possibilities of the essential oil industry in the United States. He emphasized especially the possibility of utilizing the large quantities of waste apricot, almond and cherry pits which were formerly shipped to Germany for making oil of bitter almonds. Mr. Sievers of the same office presented a paper on poisonous plants as sources of insecticides, and Dr. Stockberger spoke of the development of the peppermint industry on the west coast.

Mr. Flemer mentioned the fact that the Wilbert library comprising some 1500 volumes was still awaiting a purchaser and it is hoped that the members of the Association will advertise the matter among their acquaintances.

Report of a Meeting of the Washington Branch of the American Pharmaceutical Association held Dec. 27, 1917:

Mr. Lewton reported that adequate provisions existed in the National Museum for the custody and display of specimens illustrative of Historical Pharmacy. Members having material of this nature or knowledge of such are urged to communicate with Mr. Lewton.

The National Museum would prefer, wherever possible, that the specimens be offered as outright gifts, but where this is not desirable or feasible, it will gladly accept as loans or deposits, valuable material on the subject of pharmacy, materia medica, and the history of pharmacy. It is customary for loans to be

accepted with the understanding that they will be left undisturbed for a year or more, while deposits are usually made for a longer indefinite period. The museum can not bind itself to permanently install any exhibit, or to keep any certain assemblage of specimens always exhibited to public view. It can, however, agree to safeguard them and keep them available for examination and study whenever desired. In order to avoid duplication of material, the Museum would request that all exhibits offered it as gifts, loans or deposits, be first arranged for by correspondence and the submission of a list or inventory giving an idea of the character and quantity of the material offered.

Two communications from Dr. W. A. Puckner addressed to Mr. Hilton were presented. These communications asked that some action be taken on a proposed code of ethics between pharmacists and physicians for the purpose of eliminating a certain antagonism which it was claimed existed between pharmacists and physicians. Discussion followed as to whether any tangible antagonism actually existed between the two bodies, the prevailing opinion being that none actually existed. Mr. Flemer thought that any movement tending to bring about a better recognition of pharmacists in the government service was worthy of consideration and this might be an opening to attain the end desired.

It was felt that good might be accomplished by sending a resolution from this branch to the parent body embodying some plan by which more cordial relations between pharmacists and physicians could be established.

It was moved that a committee be appointed to consider the problem, to determine how more cordial relations between pharmacists and physicians could be promoted, especially the recognition of pharmacists in the government service and improving the situation with respect to pharmacy in the government service, and to report at the next meeting.

CHICAGO.

The ninety-second monthly meeting of the Chicago Branch of the American Pharmaceutical Association was held Friday evening, December 21, 1917, at Kuntz-Remmler's Restaurant with about 30 members and friends in attendance, president Hugh Craig in the chair.

The Chair appointed as the committee to confer with a similar committee from the C. R. D. A. on making the Branch meetings more attractive to retail pharmacists the following: Messrs. Eicher, Gray and Von Hermann.

The following nominating committee was appointed: Messrs. Day, Storer and Gathercoal. Dr. Bernard Fantus was named chairman of the committee to arrange and care for the proposed exhibit of U. S. P. and N. F. galenicals at the A. M. A. meeting in June 1918, with authority to choose his own associates.

Under committee reports James H. Wells called attention to the large amount of national, state and local legislation of interest to pharmacists. S. C. Henry, Prof. W. B. Day, Dr. J. H. Beal and C. A. Storer discussed the report.

Dr. J. H. Beal as chairman of the Special Committee on Compulsory Health Insurance responded with the statement that the final report of the committee would be ready for the next meeting. He discussed the extent and manner of the propaganda now being carried on in this country in favor of this legislation and of the secrecy maintained as to the real source of the movement and of the money by which it is being carried on.

The Secretary urged the importance of a large attendance to hear this committee report at the next meeting.

General Secretary W. B. Day presented the leading subject of the evening, "National Pharmaceutical Service." He presented in abstract the provisions of the Edmonds Bill and discussed them briefly. He referred to amendments that have been suggested. In his opinion, the provision requiring that candidates for the higher grades of officers must be graduates in pharmacy is very important. Upon it would depend the formation of a reserve corps in which the students in colleges of pharmacy might be enlisted and thereby enabled to complete their courses. In this bill, pharmacy is asking recognition on the same basis as that given medicine, dentistry and veterinary science. But physicians, dentists and veterinarians must be graduates of

their professional schools. If pharmacists now demand that they be accepted regardless of professional training, they greatly weaken their position and endanger their prospects for recognition. He called attention to the provision for promotion from the lower to the higher ranks and strongly urged all pharmacists to make a united effort to secure the passage of the bill in substantially its present form.

The Edmonds Bill was further discussed by Thos. Potts, Harry Hood, E. Von Hermann, E. H. Wisner and others. The point especially dwelt upon was that pharmacists must get back of this bill with a united front and all of their power. They must appear before the congressional committees having the bill in charge and tell them of the absolute need of trained pharmacists in the medical work of the army and why pharmacists are worthy of the recognition asked for. Unless those interested in the bill become very active and lay their cause fully before these committees the bill will receive scant attention and fail of passage.

The following endorsement was unanimously approved:

"The Chicago Branch of the American Pharmaceutical Association strongly endorses all sections of the Edmonds Bill (H. R. 5531), a bill to increase the efficiency of the Medical Department of the United States Army, to provide a pharmaceutical corps in that department, and to improve the status and efficiency of the pharmacists in the Army, and further urges pharmacists to vigorous activity in behalf of the bill, especially calling upon their congressmen to work and vote in its favor."

The present status of the alcohol situation was discussed by S. C. Henry, President Craig and others. Mr. Henry said that no new rulings had been promulgated during the month but that enlightenment regarding a number of the previous rulings was still being sought. Mr. Craig stated that with the commandeering of wood alcohol by the government, the sale of medicated alcohol, which is permitted only to druggists, should be considerably increased. Professor Day questioned as to whether alcohol medicated with 1 percent phenol and somewhat diluted with water might not be used as a beverage.

An exhibit of adulterated crude drugs was made by Secretary Gathercoal and included a number of drugs recently reported adulterated by the Department of Agriculture. Among the adulterated drugs shown were samples of

stramonium, jalap, buchu, belladonna leaves, cantharides, senna, *viburnum opulus*, etc.

The subject of substitutes for glycerin and sugar in U. S. P. and N. F. galenicals was introduced by President Craig by a statement regarding the great lack of sugar in New York and the work of the Druggists' Sugar Committee in that city.

Wm. Gray and I. A. Becker spoke on the use of sugar substitutes, especially invert sugar or corn sugar. Harry Hood dwelt upon the fact that druggists were already cutting down their sugar consumption to one-half of their former requirements.

Secretary Gathercoal mentioned the addendum to the British Pharmacopoeia that has recently been compiled and published dealing with sugar and glycerin substitutes utilized by English pharmacists. He stated that a copy had been ordered by mail and hoped it would be available for the next meeting.

President Craig called for volunteers to undertake experimental work along these lines and to report at the next monthly meeting.

E. N. GATHERCOAL,

Secretary.

CINCINNATI.

Abstract of lecture delivered by Dr. C. T. P. Fennel before the Cincinnati Branch of the American Pharmaceutical Association, January 8, 1918, on "The Manufacture, Preparation and Uses of Antitoxins and Serums" (Illustrated):

For a typical process of manufacturing antitoxins for the cure of certain infectious diseases, the one best known and most widely used of all antitoxic sera is the antidiphtheric serum. The process of manufacture of the other antitoxic sera, which have a place in medicine, differs but little from it. While the general plan of work is practically the same in all laboratories, individual methods may possibly differ somewhat, but there are no "secret processes;" and if there appear to be any, such may be set down almost entirely and safely to the imagination of the persons employing same.

A visit to a biological laboratory where this work is done on a large scale, while it is highly interesting and instructive, gives to the uninitiated very little idea of the expense attendant upon furnishing and operating such a plant, for the various pieces of apparatus have mostly to be manufactured from special designs to suit individual requirements, and time and requirements are constantly changing.

In fact, the necessarily high scientific character of this work itself and the persons in charge of such laboratories precludes the idea of secrecy.

Dr. Fennel lays particular stress upon the necessity of observing absolute sterility in all biological work, showing the sterilization of containers, apparatus and materials by subjecting same to steam under pressure for thirty minutes for three successive days, thus insuring the destruction of any bacteria in or on the apparatus, as well as the killing of the spores, which are so very resistant to all forms of sterilization.

The requirements for the development of culture media are darkness, warmth and moisture, as well as special meat presses and steam-jacketed kettles for making the bouillon.

The prepared culture media are then placed in five-liter flasks, each containing two and a half liters, stoppered with cotton and the necks covered with wax paper. These flasks are then placed in a specially constructed apparatus, which permits the sterilization of one hundred and fifty of these flasks at one time.

The diphtheria bacillus was discovered in 1883 by Klebs and in 1884 by Loeffler and is commonly known by the names of these two distinguished men as the Klebs-Loeffler bacillus. Behring, Litasato, Roux and others contributed to a method of immunizing against the organism, and Ehrlich designed a method of estimating the power of the toxin and of the antitoxin. Millions of these bacteria are required to form a colony as big as the head of a pin. As they multiply in the nose and throat of the patient, they excrete a powerful poison which is absorbed by the patient and causes the train of symptoms characteristic of the disease known as diphtheria.

In order to manufacture an antidiphtheric serum, it is necessary to have a pure culture of the causative factor, the diphtheria bacillus. While all great laboratories usually keep on hand pure cultures of the diphtheria germ, a method of obtaining the bacterium is to collect the organism from the throat and nose of patients having diphtheria. This method is, of course, of great value in confirming the diagnosis in suspected cases. Take two test-tubes, one containing a wire or a small stick of wood, charged with a pledget of cotton at its lower extremity. The other contains Loeffler's blood-serum culture mixture. The contents of both tubes are, of course, absolutely sterile. The swab is withdrawn with

the stopper, and gently passed over the exudate in the throat of the patient. It is then lightly passed back and forth over the surface of the solidified blood serum. This process transfers from the patient to the cotton swab a large number of the germs present in the throat and nose, and from the cotton swab they are again transferred to the surface of the culture media. The now inoculated culture tube is returned to the laboratory as soon as possible and placed in the incubator where it is kept for 18 to 20 hours.

Now one of the large flasks of prepared culture media taken out of the large sterilizer is inoculated with a pure culture of the diphtheria germ. This is known as a "Starter Flask," which is then transferred to the incubating room. After the starter flask has become saturated with the diphtheria germs and their toxic products, it is used to inoculate a large number of other flasks. These flasks are all numbered and returned to the incubating room, where they are kept a number of weeks, during which time the bacteria multiply, developing a toxin which goes into solution in the bouillon. After that, under proper manipulation, all of the bacteria are filtered out of the bouillon, the fluid obtained being absolutely sterile and bacteria free. This filtered toxin is transparent, sparkling and light amber in color. The filtered bouillon, containing the diphtheria toxin in solution represents an exceedingly powerful poison, however, of unknown potency. Unlike other poisons, such as morphine, strychnine, brucine, etc., where the safe therapeutic and lethal dose is known, the bacterial poisons do not give such definite knowledge. Ehrlich's method, however, is now in universal use for measuring the power of diphtheria poison. Guinea pigs of standard weight (250 Gm.) furnish the principle of Ehrlich's method by the resistance shown to the toxic effects of toxins.

Dr. Fennel pays tribute to all manufacturers of antitoxin for the excellent and humane treatment accorded the horses used for this purpose, saying they are carefully groomed, fed and watered and watched over with as much care as patients in a well-regulated hospital.

After the horse has passed all the tests (tuberculosis, glanders, etc.), he is brought into the operating room and an initial dose of (usually) 0.1 milliliter of the toxin, combined with an appropriate amount of standard test antitoxin, is administered. This is in-

jected under the skin and usually causes the horse to undergo a reaction. He may have a chill, a rise of temperature, a rapid pulse, stary eye, rough coat, urinate frequently, liquid bowel movements, generally weak and every symptom of being ill, however recovering after a few hours or a day. Then a larger dose of toxin is administered. He goes through the same experience several times until he reaches finally a dose of about 250 milliliters or 2500 times the original dose.

During this process there is developed in the blood a substance known as antitoxin which neutralizes the toxin. The horse is now considered immune as he possesses in his blood stream sufficient antitoxin to withstand, overcome or neutralize the immense amount of toxin administered to him at one dose. Some time is required for this process to become complete, the average being from three to five months. When the horse is completely immunized he is ready to be bled. This immune horse is placed in the operating stall, a site over the external jugular vein is thoroughly scrubbed and sterilized. A sterile trocar is inserted into the jugular vein, the stylet removed and the canula connected with a sterile rubber tube which passes into the large blood tube, passing through a cotton stopper. From five to seven tubes, with a capacity of 1500 to 1800 mls each, are nearly filled with blood from each horse at a single bleeding, the quantity depending upon the size of the horse. The bleeding does not injure the horse in any way. These filled blood tubes are kept at a low temperature until the clot forms. The clot in forming encloses in its meshes of fibrin nearly all of the blood corpuscles and sinks. While the blood clot itself no doubt contains a great deal of antitoxic value, it is customary to use only the liquid blood serum. To this clear blood serum a 0.4 percent addition of cresols is made as a preservative. After being again subjected to examination by expert investigators for the detection of any bacteria, and then even more searching physiologic tests, it is then ready for the testing of its antitoxic powers.

The process of testing antidiphtheric serum for its antitoxic power is much like that of testing the toxin, but in reverse. The object of this test is to determine as closely as possible the least amount of antitoxin which will just neutralize, and no more, the already determined killing dose of the toxin. The antitoxic unit value of the serum having been determined and the serum having passed several searching

tests for purity, it is now placed in the different packages demanded by the medical profession.

CHAS. A. APMEYER,
Secretary.

CUBA.

The meeting of the Cuban Branch of the American Pharmaceutical Association was held at Havana, January 10th, Dr. J. G. Diaz presiding. Sixteen members were present. Secretary Alac n read the minutes of the preceding meeting, which were approved.

President Diaz declared that he had called the meeting in order to announce to the members the recent death, January 1st, of Prof. Joseph P. Remington, reading the following tribute:

"The present year begins sorrowfully for our profession. On the first day of January, Dr. Joseph P. Remington, the leader of American pharmacists, passed away at his residence, 1832 Pine St., Philadelphia.

"Professor Remington was born on the 27th of March, 1847. His father Dr. Isaac Remington was a distinguished physician of that time. On his mother's side he descended from Townsend Speakman, one of the oldest Philadelphia pharmacists, and inherited from his ancestors that love of work and study which, from his youth, gave character to his personality. While a student, he showed his powerful imagination and his inventive genius by constructing apparatus needed in the laboratory he had formed for his own use.

"He began his apprenticeship in January, 1863, at the age of sixteen, with the firm of Charles Ellis, Son and Co. He then commenced his course in pharmacy at the Philadelphia College of Pharmacy, graduating in 1866. He went then to New York and worked for three years with Dr. E. R. Squibb under whose direction he obtained the vast practical knowledge he possessed in analytical and manufacturing work. Owing to his mother's death he returned to Philadelphia where he worked for four years with the firm of Powers and Weightman. When he left that firm he started in business for himself, until, called in 1871 by Prof. Edward Parrish, he became his assistant in the Department of Theory and Practice of Pharmacy of the Philadelphia College of Pharmacy, which that celebrated teacher occupied until his death. He was retained in this position by Prof. Parrish's successor, the no less famous Prof. William Procter, Jr., after whose death, in 1874, Remington was appointed professor of the above-

mentioned chair. In 1879 he was made director of the Pharmaceutical Laboratory, and in 1893 dean of the college.

"In his forty-six years of teaching he distinguished himself not only for his extensive knowledge, which he presented with admirable clearness to his pupils, but also for the inexhaustible kindness of his soul. Five years ago I attended one of his lessons, and at the end of it his students surrounded him with such respect and signs of affection that he seemed more than a teacher, a loving father in the midst of his children. Few men have had such power of attraction over their followers. On that occasion he had an encouraging word for each one and for all the sweet smile that distinguished him and which was not incompatible with the greatest firmness of character.

"Prof. Remington's activity was astonishing. There is no medical or pharmaceutical publication in the United States to which he has not contributed, and each one of them contended for the honor of inserting his writings that reflected his powerful imagination and his profound and varied learning.

"As an author he leaves us his excellent work 'Practice of Pharmacy,' as well known in the United States as in England, France, Germany and Cuba.

"In collaboration with Dr. Horatio C. Wood, professor of *Materia Medica and Therapeutics* of the University of Pennsylvania, and with Dr. Samuel P. Sadtler, professor of Chemistry in the Philadelphia College of Pharmacy, he has been publishing, since 1879, the 'United States Dispensatory.' This work is a true professional monument in which all the official drugs of the British and American Pharmacopoeias are studied, and, besides, the most important ones not included in those works. Since 1879 he has been the pharmaceutical editor of 'Lippincott's Medical Dictionary.' But the work to which he devoted his greatest energies and, during his last years, the greater part of his time, was the 'United States Pharmacopoeia.' Under his direction were published those of 1890, 1900 and the ninth revision, recently printed. He had accepted this task, from which he derived no material profit, as a patriotic work, his chief pride being that the scientific inheritance bequeathed him by the memorable and most worthy Dr. Charles Rice, former chairman of the Committee of Revision, should not decrease.

"In December 1910, he visited Cuba. The students of the School of Pharmacy tendered him a lunch in the gardens of 'La Tropical'

and presented him with a flag of the School, which he prized greatly, and placed on the wall of his study. On January 5, 1911, the pharmacists of Havana gave him a farewell banquet, and in answer to the toast addressed to him by the writer of these lines, he drank to the happiness of Cuba and declared himself a true friend of the Cubans, an assurance which he made good whenever the opportunity offered itself.

"In September 1915, at the meeting of the American Pharmaceutical Association in Atlantic City, N. J., upon Dr. Alacán's suggestion that the next convention should meet in Havana, Prof. Remington so warmly seconded the motion praising in the highest terms Cuba and the Cubans, that we came very near carrying the point, and should have succeeded had not the powerful reasons of time and climate caused the protectors of the idea to desist from their purpose. That convention chiefly composed of professors of the medical and pharmaceutical colleges of the Union must meet some time between July and September, and in that season of the year the excessive heat of our island makes it impossible to hold the convention here.

"Prof. Remington's interesting conversation was always brightened by witty and opportune anecdotes from which some profitable lesson could in every case be drawn, and he always held the interest of his hearers. He had the good fortune to see his principal aims in life fulfilled. He wished to make a home, and formed a model family; he wished to be a teacher, and enjoyed in that capacity an enviable reputation; he undertook the direction of the Committee of Revision at the time when Dr. Charles Rice had stamped upon it the seal of his prestige, and so successful was he in the endeavor that it will be extremely difficult to find his substitute. The cause of all this, is that Remington devoted his whole time and his whole activity to any enterprise confided to him, feeling sure that, as he said many times: 'Fortune smiles at him who works and waits.'

"His life was not exempt from difficulties; but to those few who opposed him he gave as an answer his renewed efforts to achieve success in his undertaking. Work constituted his greatest pleasure, and he seemed to have adopted as a motto Thomas Jefferson's advice to his daughter: 'A mind always employed is always happy.' This is a true secret, the grand recipe for felicity. The idle are the only wretched.

"I have lost an excellent friend, Cuba a good friend."

Dr. Sylvia Alacán moved that a letter of condolence be sent to Prof. Remington's family and also to the Philadelphia College of Pharmacy, seconded by Dr. Remírez and carried. Adjourned.

JOSÉ P. ALACÁN, *Secretary*.

DETROIT.

The regular meeting of the Detroit Branch of the American Pharmaceutical Association was held at the Wayne County Medical Bldg., January 18th. The plans for the February and March meetings were discussed and a motion was made and carried to hold a joint meeting with the Prescott Club at Ann Arbor, February 14th.

Mr. Wendell, Display Manager of the J. L. Hudson Co., will be present at the March meeting. Miniature window displays will be exhibited and the methods of obtaining the best results will be discussed. Dr. Lescollier of Parke, Davis & Co., will also give a talk on Biological Preparations, Serums, Antitoxins, Vaccines, etc. MAY STRAWN, *Secretary*.

NEW YORK.

The January meeting of the New York Branch of the American Pharmaceutical Association was called to order by President Jos. L. Mayer in the lecture hall of the New York College of Pharmacy on Monday evening, the 14th, at 8.30 o'clock.

Sixty-two members were present.

The regular order of business was changed. The memorial meeting in honor of Charles Holzhauer and Joseph Price Remington was opened with a few words of appreciation by President Mayer.

The following then paid tribute to the deceased in beautiful words: Dr. H. H. Rusby, E. A. Sayre, C. F. Schleussner, E. G. Eberle, Dr. A. R. L. Dohme, Dr. H. V. Arny, C. O. Bigelow, Prof. C. H. LaWall, J. W. England and E. W. Runyon. Letters were read from George M. Beringer, Dr. V. Coblentz and Prof. W. B. Day.

Dr. Jeannot Hostmann then read the following resolution on the death of Mr. Holzhauer:

IN MEMORIAM.

"Charles Holzhauer has answered the call that has taken him to the great beyond. Actively engaged in retail pharmacy for over fifty years, he leaves behind him a record of achievements well worthy of emulation. Honest, useful, thorough, untiring—are some

few of the adjectives that may be truthfully applied to his life's work. He believed in the Golden Rule, and believing in it, he lived up to it. He was devoted to his family, to his friends, to his profession, to his church, to his associations—in fact—he was devoted to everything he was interested in and he was interested in everything that makes this life worth while. His advice, often sought and usually found sound, was born of a nature absolutely unselfish and noble. Well may we repeat the words of the poet:

"To live in the hearts we leave behind us is not to die."

"In so far that the members of the New York Branch of the American Pharmaceutical Association wish to express their heartfelt regret caused by the taking away of their fellow-member, Charles Holzhauer, be it

Resolved, That these words of appreciation be inscribed upon a page set aside in the minutes of this meeting, and be it furthermore

Resolved, That the Secretary be instructed to send a copy thereof to the widow of our deceased member."

It was regularly moved, seconded and carried that these resolutions be adopted.

This concluded the memorial meeting. The regular business meeting was immediately opened. Because of the lateness of the hour the reading of the minutes of the preceding meeting was dispensed with.

Membership Committee: The following applications for local membership were acted upon favorably: Edward A. Sayre, 482 Broad St., Newark, New Jersey; E. W. Runyon, 200 Sixth Ave., New York City.

The application for membership in the parent organization of Lionel T. Andrews, 3917 Syosset Street, Woodhaven, L.I., was passed upon in the usual way.

Committee on Fraternal Relations: The committee because of the lateness of the hour merely reported progress as did also the chairman of the Committee on Progress of Pharmacy and of the Committee on Legislation and Education. The Committee on By-Laws reported that a set of By-Laws would be presented at our next meeting.

Committee on Nominations: Dr. H. V. Army brought the following ticket which was endorsed by all members of this committee.

President, Frank L. McCartney; *Vice-President*, J. L. Turner; *Secretary*, Hugo H. Schaefer; *Treasurer*, Gustave Horstmann. The chairmen: *Progress of Pharmacy*, George C. Diekman; *Fraternal Relations*, J. Leon

Lascoff; *Legislative Committee*, Robert S. Lehmann; *Membership Committee*, T. F. Currans.

Unanimously endorsed by Hugo Kantrowitz, Thomas Latham and Henry V. Army.

It was regularly moved, seconded and carried that the ticket be unanimously elected by one ballot cast by the chairman of the nominating committee.

The following committee was then appointed to escort the newly elected president to the chair: Dr. H. V. Army, Dr. George C. Diekman and Dr. Jacob Diner.

President McCartney with a few appropriate words thanked the members for the honor conferred upon him.

It was then regularly moved, seconded and carried that a rising vote of thanks be awarded the outgoing president and the secretary.

HUGO H. SCHAEFER, *Secretary*.

NORTHWESTERN.

The December meeting of the Northwestern Branch of the American Pharmaceutical Association was held December 5, 1917, at the College of Pharmacy, University of Minnesota, Minneapolis, Minn. President Truman Griffen convened the session. The record of the last meeting was read and approved. Prof. E. L. Newcomb reported favorably on the work of the general membership committee for Minnesota. A detailed report of the Wulling Testimonial Dinner was presented by the secretary and treasurer. Deep regret of the demise of the late President Holzhauer and Charles Caspari, Jr., was expressed from the floor and upon motion the president was requested to appoint a committee to formulate suitable resolutions. About one hundred persons attended the interesting and instructive program of the afternoon.

1. "The Edmonds Bill," by Dean F. J. Wulling.

In his explanatory discussion Dean Wulling clearly indicated the real purport of this measure. The speaker urged all pharmacists to actively support the National Pharmaceutical Service Association and any other similar organizations that have for their purpose the securing of recognition of pharmacists in the government service. Dr. Wulling concluded his remarks with a stirring and patriotic appeal for more efficient pharmaceutical service to the country. Copies of application blanks for membership in the National Pharmaceutical Service Association were distributed and a number of pharmacists joined.

(2) "A Discussion of the War Revenue Law," by W. G. Noyes.

Possibly no one in the northwest was better qualified to discuss this law than Mr. Noyes of Noyes Brothers and Cutler, St. Paul. His remarks were very instructive as well as most interesting. Many of the problems that are continually arising concerning the application and enforcement of this law were cleared up by the speaker. Mr. Noyes solicited any queries and a number of pharmacists entered into the discussion with profit to all.

(3) "The Chemical Investigation of the Resins of *Datura Metelloides*," by Prof. Chas. H. Rogers.

Attention was called to the importance of thorough chemical and pharmacological investigation of the "extractive matters" of drugs in order that, by a clearer understanding of the chemistry and pharmacology of these so-called "inert substances," a better knowledge might be had of the part they play in conjunction with the principal active constituents in the production of the total or composite action of drugs or their preparations. The paper dealt with the chemical classification of the particular resins and also included complete chemical and physical data on the same.

(4) "An Exhibit of Vegetable Drugs Produced during 1917, Medicinal Plant Garden, College of Pharmacy, University of Minnesota," by Prof. E. L. Newcomb.

The exhibit of vegetable drugs more than repaid those who were present at the meeting. Prof. Newcomb's address was a decided stimulus to those who were actively interested in medicinal plant cultivation. The speaker urged all pharmacists to become familiar with correctly prepared drugs and, knowing them, demand them for use in their stores.

CHARLES H. ROGERS,
Secretary.

ST. LOUIS.

On December 28th and 29th, the pharmacists of St. Louis held a mass meeting at the St. Louis College of Pharmacy, for the purpose of discussing ways and means of furthering the interests of the Edmonds Bill (H. R. 5531), creating a pharmaceutical corps in the army. W. C. Bolm was chairman and M. J. Noll secretary of the meeting which became a permanent organization, representing the Alumni Association of the St. Louis College of Pharmacy, the Cinchona Club, the R. D. A. of St. Louis, the St. Louis Branch of the A. Ph. A., the St. Louis Pharmaceutical Society and the St. Louis Drug Club. Special committees were appointed to enlist the interest of the St. Louis Chamber of Commerce, the St. Louis Red Cross, the St. Louis W. O. N. A. R. D., and the St. Louis drug trade in general. A telegram endorsing the Edmonds Bill was sent direct to President Woodrow Wilson. A petition being signed by the drug trade will be forwarded to Samuel L. Hilton, of Washington, chairman of the A. Ph. A. Committee on Status of Pharmacists in the U. S. Service. Arrangements are also being made to have special representatives appear before the committee which has the Edmonds Bill under consideration. Among the speakers were Representatives L. C. Dyer and Joseph Meeker, both heartily endorsing the bill. Professor Francis Hemm, Professor Leo Suppan, C. L. Chittenden, E. A. Sennewald, Carl F. G. Meyer, Dr. W. D. Hoelscher, O. J. Cloughly, J. F. Huesgen and Dr. H. M. Whelpley are among the many who are active in the propaganda.

The central thought of all of the work is to ensure the soldiers as adequate pharmaceutical service as possible. The discussions dwelt upon the deplorable condition existing in many cantonments.

COUNCIL BUSINESS

A. PH. A. COUNCIL LETTER NO. 7.

PHILADELPHIA, November 30, 1917.

To the Members of the Council:

The following budget of appropriations for 1918 is submitted by the Committee on Finance:

Proposed Budget of Appropriations for 1918.

Appropriations for General Expenses:

No. 1 Salaries..... \$ 6150

No. 2 Printing, Postage
and Stationery..... 1000

| | |
|-----------------------------------------------------|------|
| No. 3 Clerical Expenses, Secretary's Office..... | 416 |
| No. 4 Miscellaneous Expenses..... | 200 |
| No. 5 Stenographers..... | 350 |
| No. 6 Traveling Expenses.. | 150 |
| No. 7 Committee on Membership..... | 250 |
| No. 8 Committee on Unofficial Standards..... | 100 |
| No. 9 Year Book..... | 3000 |

| | |
|----------------------------------------------------------|-----|
| No. 10 Premium on Treasurer's Bond..... | 50 |
| No. 11 National Drug Trades Conference..... | 200 |
| No. 12 Section on Scientific Papers..... | 25 |
| No. 13 Section on Education and Legislation.... | 25 |
| No. 14 Section on Commercial Interests..... | 25 |
| No. 15 Section on Practical Pharmacy and Dispensing..... | 25 |
| No. 16 Section on Historical Pharmacy..... | 25 |
| No. 17 Women's Section.... | 25 |
| No. 18 National Syllabus Committee..... | 25 |
| No. 19 Committee on Recipe Book..... | 50 |

\$12091 \$12091

Appropriations for Open Account:

| | |

| No. 23 Certificates | 50 |
| | <hr/> |
| | \$7350 |

\$19441

Do you approve budget of appropriations for 1918 as above proposed? It will be regarded as *Motion No. 14 (Approval of Budget of Appropriations for 1918)*.

J. W. ENGLAND,

415 N. 33RD STREET, PHILA., PA. *Secretary.*

A. PH. A. COUNCIL LETTER NO. 8.

PHILADELPHIA, PA., December 26, 1917.
To the Members of the Council:

Motion No. 7 (Establishment of special Committee on Research), Motion No. 9 (Nomination of special Committee on Research), Motion No. 11 (Election of Members; applications Nos. 20 to 27 inclusive), Motion No. 12 (Approval of Time of Holding the 66th Annual Convention of

the American Pharmaceutical Association), Motion No. 13 (Election of E. N. Gathercoal as Local Secretary for 1918) and Motion No. 14 (Approval of Budget of Appropriations for 1918) have each received a majority of affirmative votes.

Motion No. 8 (Selection of special Committee on Research) and Motion No. 10 (Nomination of special Committee on Research) have both failed of passage.

General Secretary Day writes:

"In the current budget 1916-17, an item of \$25.00 is provided for the expenses of the Women's Section. The bills incurred by the Section amount to \$53.72. Therefore, I move and Professor Koch seconds an additional appropriation of \$28.72 to cover the deficit in this item of the budget."

The above motion will be known as *Motion No. 15 (Additional Appropriation of \$28.72 for Women's Section for 1916-17)*.

Motion No. 16 (Election of Members). You are requested to vote on the following applications for membership.

- No. 28. Russell Newton Loomis, 942 16th St., Boulder, Colo., rec. by F. J. Perusse and Chas. J. Clayton.
- No. 29. Agnes Pauline Bechmann, 1075 11th St., Boulder, Colo., rec. by Francis J. Perusse and F. W. Nitardy.
- No. 30. Israel Sulbin, 1800 N. 7th St., Philadelphia, Pa., rec. by E. G. Eberle and J. W. England.
- No. 31. William R. Neville, Griffith Drug Co., Scarborough Bldg., Austin, Tex., rec. by H. M. Whelpley and J. C. Falk.
- No. 32. Donovan D. Mosher, Wagoner, Okla., rec. by Howard S. Browne and C. V. Nichols.
- No. 33. Thomas David Turner, Henning, Tenn., rec. by E. W. Wright and R. L. Crowe.

J. W. ENGLAND,
Secretary.

415 N. 33RD STREET, PHILA., PA.

A. PH. A. COUNCIL LETTER NO. 9.

PHILADELPHIA, PA., January 2, 1918.

To the Members of the Council:

The sad news has been received of the death of Joseph P. Remington, Past President of the American Pharmaceutical Association and Past Chairman of the Council, on Tuesday, January 1, 1918. The funeral services will be held on Friday, January 4, 1918, at 1.00 P.M. at Holy Trinity Church, Nineteenth and Walnut Streets, Philadelphia, Pa.,

J. W. ENGLAND,
Secretary.

415 N. 33RD STREET, PHILA., PA.

A. PH. A. COUNCIL LETTER NO. 10.

PHILADELPHIA, January 17, 1918.

To the Members of the Council:

Motion No. 15 (Additional Appropriation of \$28.72 for Women's Section for 1916-7) and Motion No. 16 (Election of Members; applications Nos. 28 to 62 inclusive), have each received a majority of affirmative votes.

In accordance with Motion No. 9 of Council Letter No. 4, Chairman Hopp has appointed Harry V. Arny as chairman of the special

Committee on Research, and the latter writes as follows:

"Your letter announcing my appointment as chairman of the Committee on Research is at hand and I accept the honor.

"As I understand them, the duties of the Committee on Research are two-fold (a) The formulation of rules and regulations as to how awards from the A. Ph. A. Research Fund shall be made; (b) the formulation of plans for the encouragement of research.

"In performing the first duty, it is highly desirable that the fiscal agents of the Association be represented on the Committee; in performing the second duty, we should select those whose research work speaks for itself.

"It will be seen that in fulfilling the grave responsibility of selecting associates, I have had this thought in mind, choosing from the Council Committee on the Financial Status of the National Formulary, from the Research Committee of the Scientific Section and from the Research Committee of the Conference of Faculties. I hope my selections will meet with the approval of the Council.

"With this explanation, I designate the following Committee on Research: Harry V. Army, Chairman (appointed by the chairman of the Council), George M. Beringer, Julius A. Koch, Henry Kraemer, Charles H. LaWall, Edward Kremers, Wilbur L. Seoville, Alviso B. Stevens, Frederick B. Power and Henry Milton Whelpley."

The above recommendations for membership of Committee on Research will now be voted upon by the Council. Do you approve the names as recommended? This will be regarded as *Motion No. 17 (Approval of Membership of Committee on Research)*.

Upon the occasion of the funeral of Prof. Joseph P. Remington, on January 4, 1918, flowers were sent in the name of the American Pharmaceutical Association, and the following letter of acknowledgment has been received:

"1832 Pine Street, Philadelphia, Pa.

Dear Mr. England:

Please convey to the American Pharmaceutical Association most sincere thanks for their thoughtfulness in sending the beautiful flowers. They were greatly appreciated.

Very sincerely,

(Signed) ELIZABETH B. REMINGTON."

January fifth, 1918.

Motion No. 18 (Election of Members). You are requested to vote on the following applications for membership:

- No 63. Crosby B. Washburn, 32 Adams Ave. W., Detroit, Mich., rec. by Leonard A. Seltzer and A. Alton Wheeler.
- No 64. Andrew J. Cromer, 32 Adams Ave. W., Detroit, Mich., rec. by Leonard A. Seltzer and A. Alton Wheeler.
- No 65. Silverio A. Tamayo, Bayamo, Oriente Rep. of Cuba, rec. by J. G. Diaz and José P. Alacán.
- No 66. J. Max A. Schneller, 111 Wall St., New York, N. Y., rec. by E. G. Eberle and J. W. England.
- No 67. A. Elsa Schmidt, 814 Madison Ave., Peoria, Ill., rec. by E. H. Wisner and G. D. Timmons.
- No 68. Charles Emmett Bosserman, Newport, Pa., rec. by Charles H. LaWall and Ivor Griffith.

J. W. ENGLAND,

Secretary.

415 N. 33RD ST., PHILA., PA.

COMMITTEE REPORTS

NATIONAL COMMITTEE ON THE PHARMACEUTICAL SYLLABUS.

BULLETIN XVII.

In Bulletin XV, sent out on September 29, the chairman stated that he was working on some general plans for the work of preparing the new edition of the Syllabus, and all members of the committee were requested to send suggestions along this line and to express their opinions on several specific questions relating to the scope of the Syllabus. Replies were received from a few members at once but others asked for time in which to consider the matter. Some of these sent in replies later, and others will find opportunities to present their ideas as the work progresses.

Helpful suggestions were received from several members, and H. H. Rusby submitted a carefully prepared statement of some aspects of the work. Free use of the replies was made in preparing this Bulletin.

War conditions are so disturbing that it is difficult to do routine work and doubly difficult to accomplish an extra task like the preparation of a new edition of the Syllabus. Nevertheless, we shall endeavor to complete the work of revision and to bring out the new edition on time. As the third edition is scheduled to become effective on July 1, 1920, it should appear in advance of that date, and we have less than two years in which to complete the work of revision. It will be greatly to our advantage if the greater part of the work is completed at an early date, leaving only perfecting of details for the later part of the time available.

It has been conceded generally that the first two editions of the Syllabus show great progress towards the ideal which we are striving for, and that the second edition is a great improvement over the first. The duty of the present committee is to bring out an edition which shall nearly approach the ideal. To accomplish this we must retain what is good in the second edition and replace what is defective with new and better material.

The chief difficulty confronting us in preparing the Syllabus arises from the existence of two distinctly different kinds of pharmacy schools in the country. In the cities of the East we have the small number of large independent schools giving the traditional two-year course in pharmacy leading to the degree of Graduate in Pharmacy, which may be followed by a one-year graduate course; while in the West we have the relatively large number of university departments of pharmacy, giving four-year courses leading to a bachelor's degree. The briefer course is almost purely technical and is the one for which the Syllabus is prepared. The university course, presumably, should contain all that comprises the briefer course with the addition of cultural and other subjects that would justify the granting of the bachelor's degree at its completion.

Dr. Rusby submits the following pertinent questions along this and similar lines:

1. Is the new edition of the Syllabus to be so framed that it will suffice, with mere modifications, for the period when high school graduation is required for admission, or is it to be prepared expressly for the two-year high school period and radically changed thereafter? The treatment of the subject must be different in the two cases, especially as to the earlier portions.

2. Are we to continue to include in the several subjects the present recognized excess of material, knowing, and all agreeing, that it can not all be taught in the time? If not, what is to be the basis of elimination?

3. Is the Syllabus to be framed exclusively for a course of preparation for the board examination, to prepare for the ordinary clerkship in a pharmacy, being thus complete in itself, but unsuited as the first part of a more extended course? Or, is it to take cognizance of the baccalaureate course and degree of university schools, and to serve for the first year's work of such a course, and at the same time serve for the minimum course for board preparation? This is a very serious question for the committee, for the basic character of its Syllabus must depend upon the answer.

4. Is it practicable to construct a Syllabus for a three-year course that will make a proper basis for a fourth year for the B.S. degree, especially if it be followed by work for the D.Sc. degree? Can an alternative arrangement be provided by which the university schools can be permitted to employ a modification of the three-year Syllabus so that it can serve for their first three years?

5. It goes without saying that the views of all represented should be sought as to the present division of time, inclusion and omission of matter and other general subjects.

With the object of making progress with the work, the chairman will make tentative rulings on these questions, subject to revision later as found to be necessary.

1. The present minimum requirement for entrance to schools of pharmacy which are members of the Conference of Pharmaceutical Faculties is the completion of two years of a high school course, or its equivalent. This requirement has only just gone into effect and high school graduation will not be required for entrance before 1923. It seems, therefore, that the next edition of the Syllabus, probably to be effective from 1920 to 1925, should be based upon the entrance requirements of two years of a high school course, and it is so ruled.

2. While the minimum requirement is 600 hours of instruction for each of the two years of the regular course in pharmacy, it is a fact that the majority of the recognized schools give much more time than this. Therefore, it would seem to be best to retain the present general scope of the Syllabus, but that a strong effort should be made to give proportional treatment to the different subjects which are included. This matter will need more consideration later.

3 and 4. Considering all things, it appears that we can only continue our custom and prepare a Syllabus for the purely technical briefer course in pharmacy with possibly a graduate year of work along advanced lines. The cultural work done in the university schools as a part of four-year courses is elective in great part and it properly varies so much that it would not be feasible for us to limit it in the Syllabus in any way. If we bring out an acceptable edition of the Syllabus it should serve all schools of pharmacy, but in different ways, which must be kept in mind during the work of revision. While prepared as a basis for the courses in the independent schools of pharmacy, it should also be the basis of the pharmaceutical courses in the university schools, these pharmaceutical courses to be supplemented by cultural courses sufficient to satisfy the requirements for the bachelor's degree.

5. At the Indianapolis meeting of the committee, it was decided to secure suggestions and constructive criticism of our work from as many of those who are interested as is possible. The chairman fully appreciates the importance of such help and we should secure it in every possible way, but it must be done in such a way as to allow us to finish our work in time. We can get the help we desire, without undue delay, in at least three ways. First, by considering the criticisms of the present edition of the Syllabus; second, by correspondence with interested persons, and third, by suitable publicity concerning our work as it progresses, which will lead to more criticism, some of which will be helpful.

The most important criticisms of the previous editions of the Syllabus have pointed out that the book has many inconsistencies of treatment and is poorly proportioned, particularly that some relatively unimportant subjects received treatment far beyond what they deserve, also that certain parts of the work have treated the subjects as a text-book or compend should do and not like a Syllabus which should give lists of topics to be included in the various courses, and not develop these topics. These are valid objections and should be kept in mind during all the work of revision. Later we shall provide for editing the revised portions to make them conform as nearly as possible to a standardized method of treatment.

The chairmen of the sub-committees are requested to proceed at once with the revisions of their sections of the work and to transmit the revised separate subjects for distribution as fast as the sub-committees are agreed upon them. In preparing the second edition we found it well to assign different subjects to different members for revision, thus distributing the work. After revision, the part was submitted to the chairmen of the sub-committees for further revision if necessary. Then they were transmitted to the chairman of the whole committee for distribution and final revision before adoption. It is suggested that this method be used as far as practicable.

Nothing has been said in this Bulletin about the proposed Syllabus for the year of graduate work. This is quite different from the matters discussed here, and it will be made the basis for a separate Bulletin.

Respectfully submitted,

THEODORE J. BRADLEY, *Chairman*.

PROCEEDINGS OF AN ANNUAL MEETING OF THE NATIONAL DRUG TRADE CONFERENCE HELD AT THE HOTEL EMERSON, BALTIMORE, JANUARY 4, 1918,
IN PURSUANCE OF A CALL OF THE PRESIDENT UPON THE WRITTEN
REQUEST OF FIVE DELEGATES.

MORNING SESSION.

The meeting was called to order by President John C. Wallace at 10.30 A.M.

The roll being called the following persons answered:

Representing the American Pharmaceutical Association:—John C. Wallace and James H. Beal. (Samuel L. Hilton, absent, had written and approved holding the meeting at Baltimore.)

Representing the National Wholesale Druggists' Association:—Charles A. West, George W. Lattimer and W. L. Crounse, alternate for C. Mahlon Kline.

Representing the National Association of Retail Druggists:—Samuel C. Henry, James F. Finneran and Eugene C. Brokmeyer.

Representing the American Association of Pharmaceutical Chemists:—George C. Hall, W. C. Abbott and J. H. Foy, alternate for B. L. Maltbie.

Representing the American Drug Manufacturers' Association:—Adolph G. Rosengarten, Charles M. Woodruff and A. R. L. Dohme.

Representing the Proprietary Association of America:—Fred K. Fernald, Philip L. Heuisler and Frank A. Blair, alternate for Harry B. Thompson.

C. M. Woodruff moved the adoption of the following resolution:

WHEREAS, unexpected conditions respecting hotel accommodations have made it impossible to hold an annual meeting at Washington this year, therefore be it

Resolved, that the Code of Rules and Regulations requiring this meeting to be held at Washington be suspended by unanimous consent, and that this meeting be hereby declared as regular in every respect as if it had been held in Washington.

Motion duly seconded and carried unanimously.

The minutes of the meeting held April 30, 1917, were read and approved.

The privileges of the floor were duly extended to Charles J. Lynn, president, and W. J. Woodruff, secretary of the American Drug Manufacturers' Association; also to R. C. Stofer of the Norwich Pharmacal Company and Mr. Beardsley of the Proprietary Association of America.

The President made a statement that an annual meeting had been first called for January 7 and 8, and the dates had been advanced to the third and fourth upon the telegraphic request of five delegates. The Secretary supplemented the statement by reporting that within six working hours after he had received the President's first call he had notices to all delegates in the mails; further, that he had notices of the change in dates in the mails within four working hours after he received the telegraphic notice from the President.

The following report of the Executive Committee was then read, duly ordered received and laid over for action later:

REPORT OF THE EXECUTIVE COMMITTEE.

TO THE MEMBERS OF THE NATIONAL DRUG TRADE CONFERENCE:

The Executive Committee of the National Drug Trade Conference begs leave to report that a meeting was held at Room 323 in the Hotel Emerson, Baltimore, Thursday afternoon, January 3, 1918, at which were present all the members of the Committee.

The meeting having been called to order by President Wallace, J. H. Beal moved that any requirement that the Executive Committee should meet at Washington be waived in consideration of the condition with respect to hotel accommodations.

Motion seconded and unanimously adopted.

The minutes of the meeting of the Conference held at Washington, April 30, 1917, were read and the adoption of the same was recommended to the Conference.

The resolutions recommended to the Conference by the joint conference on the subject "The Habit-Forming Narcotic Drug Evil," held May 1 and 2, 1917, were referred to J. H. Beal, A. R. L. Dohme and J. F. Finneran for revision and ordered to be submitted to the Conference for action when so revised.

The Secretary-Treasurer then read the following report:

NATIONAL DRUG TRADE CONFERENCE.

FINANCIAL STATEMENT OF DATE JANUARY 1, 1918.

RECEIPTS.

| | |
|--------------------------------------------------|-----------|
| January 15, 1917, On hand as per report..... | \$410.38 |
| January 26, 1917, Received from N. W. D. A..... | 50.00 |
| January 26, 1917, Received from P. A. A..... | 50.00 |

|--------------------------------------------------------------------------|--------|--------|
| Check 23, Jan. 20, 1917: | | |
| Paid stenographer for copying minutes of meeting. | 5.40 | |
| Check 24, Feb. 20, 1917: | | |
| Postage stamps | 3.00 | |
| Check 25, March 1917: | | |
| R. S. and A. B. Lacey, opinion in aspirin matter | 150.00 | |
| Check 26, March 20, 1917: | | |
| Paid for printing the opinion in the aspirin matter | 10.30 | |
| Check 27, March 21, 1917: | | |
| Dues U. S. Chamber of Commerce | 10.00 | |
| Check 28, April 5, 1917: | | |
| Paid for printing revised list of members, and rules, etc. | 5.10 | |
| Check 29, April 6, 1917: | | |
| Stamps and telegrams to date | 4.90 | |
| Check 30, April 9, 1917: | | |
| Paid for 100 copies Free Press containing article on Narcotic Conference | 2.00 | |
| Check 31, June 11, 1917: | | |
| Paid Shorthand Reporting Co. for reporting Narcotic Meeting | 143.50 | |
| Check 32, December 15, 1917: | | |
| Postage stamps to date | 3.00 | 337.20 |

Balance on hand January 1, 1918 \$ 373.18

There are still bills for telegrams and for mimeographing unpaid that have not yet been rendered. These will not amount to ten dollars.

Respectfully submitted,

CHARLES M. WOODRUFF,
Secretary-Treasurer.

James F. Finneran moved that the Executive Committee recommend that the Conference make the usual assessment of \$50 upon each constituent organization member for the year 1918.

Seconded, put to vote and adopted.

James F. Finneran moved that the Executive Committee recommend that the Conference adopt a resolution providing that the expenses of any officer or delegate assigned to any special duty in the interval between regular meetings shall be paid from the funds of the Conference.

Seconded, put to vote and carried.

A communication from the National Pharmaceutical Service Association was then read, asking that the Conference endorse the Edmonds Bill which provides for a pharmaceutical corps in the army, and also that the Association be invited to become a member of the Conference. After considerable discussion the communication was referred to the Conference with the recommendation that the Conference endorse the general proposition to create a pharmaceutical corps in the United States Army.

F. K. Fernald moved that Samuel C. Henry be requested to invite a representative of the National Pharmaceutical Service Association to address the Conference upon the subject of the communication.

Motion seconded, put to vote and carried.

J. H. Beal moved that the Executive Committee recommend that the Conference stand adjourned for a period of two hours from one o'clock, Friday, January 4, 1918, out of respect to the memory of the late Professor Joseph Price Remington, of Philadelphia, Pa., whose useful life and eminent services to pharmacy have been of vast and continuing value to the manufacturing, chemical and pharmaceutical industries, and to every division of the entire drug trade.

A chorus of seconds greeted the motion and it was put to vote and carried unanimously.

President John C. Wallace was then duly authorized and instructed to telegraph Adolph G. Rosengarten, of Philadelphia, to attend the funeral of the late Professor Joseph P. Remington as the representative of the Conference, or, if impossible to attend, to select someone to act in his stead.

J. H. Beal moved that a committee of three be appointed by the chairman of the Executive Committee to frame resolutions on the life and services of the late Joseph P. Remington, and report same to the afternoon session of the Conference on January 4, 1918.

Motion seconded, put to vote and adopted.

The Chairman then appointed Messrs. A. R. L. Dohme, Samuel C. Henry and R. C. Stofer as such committee.

The Committee then adjourned to meet at the call of the Chairman.

JOHN C. WALLACE,
Chairman.

CHARLES M. WOODRUFF,
Secretary.

The Committee appointed April 30, 1917, to ascertain whether the organization members were willing that the Code of Rules and Regulations be amended so as to give the Conference power of action respecting motions and resolutions adopted unanimously by the Conference, without first securing the approval of each constituent organization as now required by such Code, submitted the following report.

REPORT OF THE COMMITTEE TO SECURE GREATER POWERS FOR THIS CONFERENCE.

GENTLEMEN OF THE NATIONAL DRUG TRADE CONFERENCE:

Your committee appointed to attend the several national associations which are members of this Conference regret to state that they have been unable to complete their work up to this time. They have presented this question to several of these associations, however, and can report that in cases of the N. A. R. D. and the A. Ph. A. there is distinct willingness to transfer to their delegates the necessary powers to act subject to the confirmation by their executive committee or Council in case of the N. A. R. D. and freedom to act alone in case of A. Ph. A.

We were unable to get to the other association meetings and will have to ask that the committee be continued to secure similar action on the part of the remaining association members.

Respectfully submitted,

DR. A. R. L. DOHME,
JAMES F. FINNERAN,
CHARLES A. WEST,
Committee.

Report received and committee continued.

The committee appointed April 30, 1917, to secure recognition for pharmacy on the Advisory Board of the Council of National Defense then submitted the following report which was received and laid over for later discussion:

REPORT OF COMMITTEE TO SECURE OFFICIAL RECOGNITION ON THE NATIONAL COUNCIL OF DEFENSE.

TO THE PRESIDENT AND MEMBERS OF THE NATIONAL DRUG TRADE CONFERENCE:

Your committee upon this important subject, concerned as its activities must necessarily be with the winning of the war by endeavoring to convince the Federal Government that the coöperation and advice of an experienced expert from the drug trade would save the Government both money and time and at the same time secure better results, undertook its mission soon after it was appointed. It was however unsuccessful in securing either a hearing or recognition at that time, being told that such matters had been provided for in the Government's usual routine and methods, in which no change could be made

Your committee ventures the assertion that until the drug trade shall present to the Government, the press and the people as united a front and as well organized and managed an association as does medicine, it can not hope to secure what it wants or what its importance and service entitles it to have. It takes this opportunity to lay before you the experience which six of your delegates had at the War Service Committee Conference, called together by the U. S. Chamber of Commerce on December 12, 1917, at Washington, at the instigation of and under the protection of the National Council of Defense. The history of the War Service Drug Committee, appointed by a conference of manufacturers last spring and called as the result of the Government's experience in failing to have a practical drug man upon its Council of Defense, is well known to you and need not be detailed here. There is no such committee now and the Government has need for and is urgently calling, as I shall show in the discussion to follow, for the appointment of such a War Service Drug Committee by the united drug industries of this country.

The six delegates representing six national associations composing this Conference were present on December 12, at Washington, each a chairman of a war service committee named by his association. They came with the expectation to act separately as six committees. They found that the meeting resolved through a committee named by it that wherever possible a single committee should represent an industry. They held a meeting, suggested by Messrs. Ohliger and Blair, and asked the chairmen of this Committee to attend. They concluded unanimously that this N. D. T. C. met all the requirements of the resolutions passed by the meeting and determined to register this Conference with the notation upon the registration card that its war service committee would be appointed later. They further instructed your chairman of this Conference to call a meeting of the Conference at the earliest possible moment which he did by wire the following morning, also notifying the secretary of this Conference at the same time by wire. This meeting was to be for the purpose of appointing this War Service Drug Committee. Your committee feels that it is their duty, being appointed to secure official recognition of this Conference by the National Council of Defense, to report to-day that the Government is in urgent need of a united representative war service committee representing the active and united drug trade. Urgency is becoming more acute every day since it is becoming apparent that we must supply many more men and at a quicker rate than we had expected to do and it is our duty as patriotic citizens, willing and anxious to do all we can to help win the war, to name this War Service Committee at this meeting. We further believe this committee should have at least one representative of each association, member of this Conference, upon it, and of the manufacturing member association several, also C. L. Huisking as representative of the drug brokers. We think, finally, that this committee should be geographically centralized, if possible, as suggested by the resolutions and should meet at least once a week and devote much if not all of their time to the country's service and that it should have a chairman and a secretary and a stenographer.

Respectfully submitted,

DR. A. R. L. DOHME
EUGENE C. BROKMEYER,
SAMUEL L. HILTON,

Committee.

The Special Committee on the Interpretation and Enforcement of Food and Drug Laws then submitted the following final report which was duly accepted and approved, and the committee discharged.

REPORT OF THE SPECIAL COMMITTEE ON INTERPRETATION AND ENFORCEMENT OF THE FOOD AND DRUG LAWS APPOINTED IN PURSUANCE OF A RESOLUTION PASSED AT A REGULAR MEETING OF THE NATIONAL DRUG TRADE CONFERENCE HELD DECEMBER 16, 1915.

TO THE OFFICERS AND MEMBERS OF THE NATIONAL DRUG TRADE CONFERENCE:

Your Committee, appointed in pursuance of the action taken at the regular meeting of the Conference, held December 16, 1915, and known as the Special Committee on Interpretation and Enforcement of the Food and Drug Laws, begs leave to submit its final report.

Rumors of malfeasance on the part of subordinates in both Federal and State employ

continue to reach our ears, but always indirect or with reservations that make what information is vouchsafed unavailable. For example, it is again reported that an inspector in an eastern state is carrying a side line that he directs to the attention of the retailer as soon as he has finished his inspection and before he has informed his prospect of his findings.

The Chairman of the Committee might give the name and address of a state food and drug commissioner who frankly acknowledged that his adverse report upon one preparation he had condemned had been based upon a misreading of the label which upon a more careful examination was found to state that the pill contained 1-240 grain instead of 1-24; but before the mistake was discovered the dealer had been informed that the pill was substandard, and had resolved to patronize the particular manufacturer concerned no longer.

One evil exists to which attention should be directed. It is inherent in the power which the law gives to administrative bodies to dictate what therapeutic claims may be made for certain drugs and what may not, and to force the opinion of a faction in power upon manufacturers, whatever contrary and equally trustworthy views may prevail.

It is easy for the Government to find experts who will go upon the witness stand and testify that almost any therapeutic statement that may be made is false. In 1877 to 1880 such experts would have sworn that Cascara Sagrada was a fake; in 1894 that diphtheria antitoxin was fraudulent and would not cure diphtheria.

Such testimony under present procedure can only be combated by other expert testimony at enormous expense, even to prove the simplest proposition. The defendant may have hundreds of favorable reports from the most authentic sources; but they will not be admitted even to prove the lack of that intent to defraud which the United States Supreme Court has said is essential to constitute a violation of the Shirley amendment.

The result of this condition is that manufacturers plead guilty when they are not guilty, to save expense; pharmaceutical progress is prejudiced and medicine confined to the bounds by opinionated theorists who regard the practical experience of liberal physicians as unworthy of credit.

If such a condition had existed a century ago medicine and pharmacy would be to-day where they were then.

This weight should be lifted in the interests of justice and progress; but it will not be until our newspapers appreciate the situation and arouse a public sentiment that will drive medical bigotry and intolerance to the rear, in the interest of the very public health of which these doctrinaires assume to be the guardians.

However, your committee was created to afford a medium through which well-founded specific complaints, especially of retailers who are not so able to care for themselves as wholesalers and manufacturers, might reach the fountainhead, and proper redress be afforded. The existence of the committee has been known to the whole industry and trade for two years, although it has been given no work to do; wherefore it begs leave to submit this as its final report and to ask that it be honorably discharged.

C. M. WOODRUFF,
JAMES H. BEAL,
GEORGE W. LATTIMER,
R. C. STOFER,
SAMUEL C. HENRY,
Committee.

George C. Hall moved that the Conference continue its affiliation with the United States Chamber of Commerce during the ensuing year.

Motion seconded by James F. Finneran, put to vote and carried.

The Conference then took up the recommendations of the Executive Committee and respecting the first one, R. C. Stofer moved that a committee of five be appointed to frame resolutions on the late Professor Joseph P. Remington, and that Messrs. A. R. L. Dohme, Samuel C. Henry, R. C. Stofer, John C. Wallace and Frank E. Holliday constitute such committee.

Motion duly seconded and carried.

The resolutions recommended by the joint conference held at Washington, May 30, 1917, under the auspices of the National Drug Trade Conference, as revised by the committee appointed by the Executive Committee for that purpose were read seriatim and adopted as follows:

REPORT OF THE COMMITTEE ON RESOLUTIONS.

J. H. BEAL: Mr. President and Gentlemen, the Committee on Resolutions recommends that the joint convention of members of the National Drug Trade Conference and of delegates from municipal and state governments, and the various organizations and societies existing for the purpose of controlling crime and the evils resulting from the misuse of habit-forming narcotic drugs, and of representatives of various Federal departments, recommend to the National Drug Trade Conference the adoption of the following resolutions:

1. That the results of public and private investigation very clearly indicate that there has been a large decrease in the distribution of habit-forming narcotic drugs through the regular drug trade channels since the enactment of the Federal Anti-Narcotic Law, commonly known as "The Harrison Law," and that the principal proportion of such drugs now supplied to addicts and to the under-world comes through unregistered dealers operating in defiance of law, whose supplies are very largely obtained by theft and burglary and through the operations of smugglers.

2. That, whereas investigation clearly proves that large quantities of habit-forming narcotic drugs are smuggled into the United States, and form one of the principal sources of supply of drug addicts and of the under-world, materially increased precautions against smuggling will have to be taken, before the supply of such drugs to illegitimate distributors can be successfully controlled.

3. Since investigation indicates that a considerable proportion of the supply of habit-forming narcotic drugs in the hands of illegitimate distributors has been obtained through theft and burglary while in storage or *in transit*, and since the number of such thefts and burglaries is constantly increasing, the National Drug Trade Conference earnestly advises and urges all members of the *medical professions and of the drug trade* to a fixed policy of preserving their stock of such drugs in securely locked compartments, vaults, or burglar-proof safes, and under such precautions as will effectually prevent access thereto only by trustworthy and properly authorized employees.

4. That the market for habit-forming narcotic drugs handled by unregistered dealers in defiance of law and obtained by theft, burglary, or smuggling, or other illegal source of supply, is very largely created and sustained by the difficulty of addicts in obtaining such drugs through the normal channels of trade, and who, in their desperation, are ready to pay enormous prices for such drugs.

5. That it is the opinion of experts, who have carefully investigated the subject, that no amount of legislation, either state or federal, will effectually suppress the traffic in habit-forming narcotic drugs by unregistered and surreptitious dealers, until proper and sufficient provisions have been made for the care and treatment of existing drug addicts, whose purchases sustain the secret markets for such drugs.

6. That investigation shows it to be essential to the suppression of the evils due to the misuse of habit-forming narcotic drugs, that provision should be made for the treatment of existing drug addicts in municipal, state, or federal sanatoria, or in private sanatoria, under strict public supervision and control.

7. That investigation has developed the fact that numerous so-called "institutions" for the treatment of drug addicts, under private control, are, in fact, conducted for the profit to be obtained through the supply of the drugs to addicts, or for the exploitation of the addict, and that the methods of treatment used therein are calculated to perpetuate, rather than to cure, drug addiction.

8. That in consequence of the foregoing established facts, all privately conducted sanatoria for the treatment of drug addiction should be subject to strict supervision and control by the public authorities entrusted with the enforcement of anti-narcotic laws.

9. That in order to make state anti-narcotic laws capable of effective enforcement, every such law should contain provisions making it an offense to have possession of habit-forming narcotic drugs, unless satisfactorily explained, and also making simple proof of possession of such drugs *prima facie* evidence of violation of the law.

10. That the furnishing of addicts, not under restraint and responsible control, with habit-forming narcotic drugs, to be self-administered by such addicts as a part of the treatment for the cure of drug addiction, is contrary to public policy and should be prohibited in all cases.

11. That there is great need for the further study of the problem of drug addiction and of the treatment of drug addicts, and that publications especially addressed to the members of the drug trade and to the medical professions are requested to use their best efforts for the collection and dissemination of authoritative and reliable information concerning action of the so-called habit-forming narcotic drugs and the action and reaction of such drugs on addiction patients.

12. That state anti-narcotic laws should contain provision for the revocation of the license of physicians, pharmacists, or other licensed persons, convicted of the wilful violation of the anti-narcotic laws.

13. That the possession of hypodermic syringes or needles by drug addicts should be an offense under the law, and proof of the possession of such instruments by such addicts should render them subject to arrest and restraint.

The Secretary-Treasurer's report was then approved.

The recommendation of the Executive Committee that the usual assessment of \$50.00 upon each organization member be made for the ensuing year was duly approved and the assessment ordered.

The recommendation of the Executive Committee that the expenses of any officer or delegate assigned to any special duty in the interval between regular meetings be paid from the funds of the Conference was duly approved, and it was so duly ordered.

The communication from the National Pharmaceutical Service Association was received, and the recommendation of the Executive Committee referred back for further consideration.

The recommendation of the Executive Committee that the Conference stand adjourned from one o'clock for two hours in respect to the memory of the late Professor Joseph Price Remington was unanimously approved and adopted by a standing vote.

A. R. L. Dohme stated that he had arranged to have flowers sent to the home of the late Professor Remington on behalf of the Conference and his action was unanimously confirmed.

The following report of the special committee on Delayed Importations was then submitted, approved of and the Committee continued:

REPORT OF COMMITTEE UPON DELAYED IMPORTATIONS.

TO THE PRESIDENT AND MEMBERS OF THE NATIONAL DRUG TRADE CONFERENCE:

While this report is not strictly the report of a committee of this Conference, it does represent the Conference as well as the N. W. D. A. at a hearing of the Bureau of Chemistry at Washington on March 25, 1917, called by Dr. Carl L. Alsberg. It was deemed by the secretary of the Conference, since it appeared desirable, at a meeting held on the evening preceding the hearing at the Willard Hotel, that it would better serve the purpose as a N. D. T. C. committee, than as a N. W. D. A. committee.

Your chairman, therefore, feels it desirable to report the result of the hearing. Briefly stated it was that publicity of articles and importers suffering from delay by not being up to standard should not be had. Further, that greater uniformity in methods and standards for admitting drugs should be had at the several ports of entry of this country. Further, that publicity of methods of assay and tentative standards of unofficial drugs should be had, so that importers might advise their correspondents abroad as to what requirements their next shipments of goods should meet. Finally, that the Conference for the drug trade desired a full coöperation between the Bureau and itself to the end that before any new tentative standard or assay or test was adopted, it be referred to the Conference committee consisting of Messrs. C. Mahlon Kline, I. McKesson and A. R. L. Dohme for criticism and change or approval.

Dr. Alsberg agreed to all these suggestions, except the last coöperation suggestion, which he said appealed to him very much, and which he would take under advisement.

At a meeting and dinner of the Baltimore Drug Exchange, which Dr. Alsberg attended as invited guest of honor, he publicly announced that he had favorably considered the coöperation suggestion of the N. D. T. C. committee. Shortly afterwards we acted upon this suggestion and submitted to your committee proposed tentative standards for dandelion root, aletris root and cramp bark (*Viburnum opulus*). Your committee promptly took up the three tentative standards and studied them in the light of their laboratory experience and

records, and reported back their criticism, data and findings. Among these was the finding that cramp bark should be in future as it had been for 20 years or more *Acer spicatum* or mountain maple bark, whereas the Bureau had concluded to permit the use of the common name—Cramp Bark—solely for true *Viburnum opulus* or high cranberry bark.

In the next number of the *Service and Regulatory Announcements*, the official bulletin of the Bureau, there appeared the adopted tentative standards of these three drugs. From this it appears that our suggested changes in dandelion root and aleris root had been adopted, but that cramp bark had to change its 20 years of *Acer spicatum* for *Viburnum opulus*. This was in April or May 1917. Since that time nothing has been heard from the Bureau of Chemistry in the coöperation line by your committee nor did a subsequent effort of your committee to permit cramp bark to continue to be *Acer spicatum* as the U. S. P. VIII described it to be under the name of *Viburnum opulus* with synonym, Cramp Bark, produce any result.

Your committee feels that it might be considered officious by the Bureau for it to knock at its door for more coöperation work, and has hence not heard anything since last summer from the Bureau.

Your committee asks to be continued so that when further suggestions come it may be in a position to promptly reply.

Respectfully submitted,

A. R. L. DOHME,

Chairman.

Mr. Woodruff then gave notice that at the next session of the Conference he would move to amend the first paragraph of Section 4 of the Code of Rules and Regulations so as to read:

Section 4: Meetings—The Conference shall hold one regular annual meeting at a time and place to be designated by the president, and such additional meetings as may be provided for.

The report of the special committee to secure recognition of pharmacy on the Advisory Board of the Council of National Defense was then taken up and discussed by A. R. L. Dohme.

Inquiry disclosed that each constituent organization had its own war service committee.

J. H. Beal then moved the adoption of the following as the sense of the Conference, which motion was duly seconded:

REPRESENTATION ON WAR SERVICE COMMITTEE.

1st. That each of the several constituent associations, members of the National Drug Trade Conference, should appoint its own war service committee to confer with the War Committee of the Chamber of Commerce of the United States, and with the war authorities of the United States Government, in the consideration of matters or questions affecting the particular divisions of the drug trade or drug manufacturing industries which such constituent associations respectively represent.

2nd. That the National Drug Trade Conference suggests the formation of a joint committee composed of an equal number of members from each of the above-proposed war service committees to consider and report upon matters and questions in which the several divisions of the drug trade or drug manufacturing divisions possess a joint or common interest.

3rd. That in so far as it may be proper and consistent for it to act, the National Drug Trade Conference will coöperate with and assist the several war service committees and the above-suggested joint committee in the discharge of their respective duties in representing the various divisions of the drug trade and drug manufacturing industries.

On motion consideration of the motion was laid over until the afternoon session.

President Wallace then appointed the following nominating committee: Messrs. Rosengarten, Henry, Lattimer, Beal, Hall and Fernald.

The hour of one having arrived the Conference adjourned until three o'clock out of respect to the memory of the late Professor Joseph P. Remington.

AFTERNOON SESSION.

The Conference reconvened for the afternoon session at 3.30, all delegates being present.

President John C. Wallace called the meeting to order.

Secretary C. M. Woodruff moved that the motion of J. H. Beal be amended by striking out all of the second paragraph, making the third paragraph read "2nd," and eliminating the words "and the above-suggested joint committee" from the last paragraph.

The motion was seconded, put to vote and carried.

The motion, as thus amended, was put to vote and carried, and now reads:

1st. That each of the several constituent associations, members of the National Drug Trade Conference, should appoint its own war service committee to confer with the War Committee of the Chamber of Commerce of the United States, and with the war authorities of the United States Government, in the consideration of matters or questions affecting the particular divisions of the drug trade or drug manufacturing industries which such constituent associations respectively represent.

2nd. That in so far as it may be proper and consistent for it to act, the National Drug Trade Conference will coöperate with and assist the several war service committees in the discharge of their respective duties in representing the various divisions of the drug trade and drug manufacturing industries.

The committee appointed to frame suitable resolutions relating to Professor Remington then submitted the following report:

JOSEPH PRICE REMINGTON.

WHEREAS, in his wisdom it has pleased Almighty God to take from our midst our distinguished and highly esteemed friend and fellow pharmacist, Joseph Price Remington, and

WHEREAS, the services which Joseph Price Remington has rendered the people of this entire country, the profession of pharmacy, the entire drug trade and the many thousands of young men who have enjoyed the privilege of being his pupils have been of unusual prominence, extent and excellence, and

WHEREAS, the Revision Committee of the U. S. P. has been especially benefited and assisted by his eminent qualities as leader and chairman during a period of over twenty-five years, and the American Pharmaceutical Association has enjoyed his wise counsel and sincere help and support as member, counselor and president and

WHEREAS, the International Pharmaceutical Congress has for many years enjoyed the advantage and benefit of his varied experience and advice and

WHEREAS, all the many interests and branches of pharmacy and the drug trade have by his demise suffered a great and irreparable loss, and his many thousands of friends in this country and abroad have lost and will sadly miss that ever-present and always encouraging smile and pleasant word which was so characteristic of Prof. Remington and has smoothed over so many "rough" and "stony" spots in the life and career of his pupils and friends and

WHEREAS, it seems incredible and difficult to conceive that his many friends, associates and pupils will never in this life again see the genial countenance and grasp the warm friendly hand of our departed friend, now be it therefore

Resolved, by the National Drug Trade Conference in meeting assembled on this the day on which his mortal remains shall be transferred to their last resting place in the "city of brotherly love" in which he has spent practically all his many useful happy years, that in his death pharmacy, and the drug trade and this Conference have lost one of their most prominent and distinguished representatives and friends, and be it further

Resolved, that this National Drug Trade Conference hereby gives expression to its feeling of sorrow at the loss it has sustained through his death and of sympathy with his family in their great bereavement and be it further

Resolved, that a copy of these resolutions be spread upon the minutes of this Conference and as well that a copy be sent to the family of our deceased friend and to the pharmaceutical press.

Respectfully submitted,

A. R. L. DOHME, *Chairman*,
SAMUEL C. HENRY,
R. C. STOFER,
JOHN C. WALLACE,
FRANK E. HOLLIDAY.

The Executive Committee reported back the following resolution which was duly adopted:
Resolved, that the National Drug Trade Conference, not intending to approve any bill or measure it has not deliberated upon, endorses the creation of a pharmaceutical corps in the United States Army.

The motion to amend the Code of Rules and Regulations, notice of which was given at the morning session, was taken up and unanimously adopted.

The first paragraph of Section 4 of the Code of Rules and Regulations will therefore read as follows:

Section 4: Meetings—The Conference shall hold one regular annual meeting at a time and place to be designated by the president, and such additional meetings as may be provided for.

ELECTION OF OFFICERS AND EXECUTIVE COMMITTEE.

The following officers and members of the Executive Committee were then nominated and elected in accordance with the Code of Rules and Regulations to serve during the ensuing year:

President, James H. Beal of Urbana, Ill.

First Vice-President, Samuel C. Henry of Chicago, Ill.

Second Vice-President, Dr. Wallace C. Abbott of Chicago, Ill.

Third Vice-President, C. Mahlon Kline, of Philadelphia.

Secretary-Treasurer, Charles M. Woodruff of Detroit, Mich.

Members of Executive Committee to act with the President and Secretary: John C. Wallace of New Castle, Pa., James F. Finneran of Boston, Mass., Dr. W. C. Abbott, of Chicago, Ill., Fred K. Fernald of Elkhart, Ind., Dr. A. R. L. Dohme of Baltimore, Md., George W. Lattimer of Columbus, Ohio.

Delegate and Councillor to C. C. of U. S. A., Samuel L. Hilton, of Washington.

President James H. Beal then moved that the Executive Committee be authorized to fill any vacancies that may occur during the year.

Motion seconded and adopted.

There being no further business the Conference adjourned to meet upon call as provided by the Code of Rules and Regulations.

JAMES H. BEAL, *President*.

CHARLES M. WOODRUFF, *Secretary*.

UNITED STATES PUBLIC HEALTH SERVICE.

List of changes of duties and stations of commissioned and other officers of the United States Public Health Service for the seven days ended January 16, 1918.

Pharmacist Charles Slough. Relieved at Chicago, Ill. Proceed to Marine Hospital, Mobile, Alabama. Dec. 31, 1917.

Pharmacist B. E. Holsendorf. Bureau letter dated Nov. 28, 1917. Amended to read "Report immediately to Bureau for temporary duty." Jan. 3, 1918.

Pharmacist C. G. Carlton. Relieved at Lexington, Ky. Proceed to Marine Hospital, Chicago, Ill. Dec. 31, 1917.

Pharmacist Louis W. Ryder. Relieved at Marine Hospital, Mobile, Ala. Proceed to Lexington, Ky., for duty. Dec. 31, 1917.

Sanitary Engr. L. C. Frank. Proceed to Gulfport, Miss., and other places in the vicinity for studies of malaria. Dec. 29, 1917.

Sanitary Engr. H. R. Crohurst. Proceed to Augusta, Ga., to investigate water supply system. Dec. 31, 1917.

Sanitary Inspector W. Purington. Proceed to Greenville, S. C., for consultation on milk situation. Jan. 3, 1918.

Scientific Asst. A. F. Allen. Relieved at Anniston, Ala. Proceed to Hattiesburg, Miss., on special temporary duty. Jan. 3, 1918.

Prof. Carl Voegtlin. Proceed to Philadelphia, Pa., and New York, N. Y., for the inspection of establishments licensed for the manufacture of Araphenamine. Jan. 15, 1918.

Sanitary Engr. L. C. Frank. Proceed to New Orleans, La., and other places in the Southern States for the conduct of malaria studies. Jan. 11, 1918.

Special Expert W. C. Purdy. Proceed to Lonoke, Ark., for duty in connection with malaria investigations. Jan. 5, 1918.

Sanitary Bacteriologist E. J. Thorialt. Relieved at Cincinnati, O. Report to Director, Hygienic Laboratory, for duty in studies of industrial hygiene. Jan. 7, 1918.

Scientific Asst. K. R. Glennan. Relieved at Macon, Ga. Proceed to Houston, Texas, on special temporary duty. Jan. 8, 1918.

EDITORIAL NOTES

Editor: F. G. EBERLE, Bourse Building, Philadelphia, Pa.

Committee on Publication: J. W. ENGLAND, *Chairman*; G. M. BERINGER, CASWELL A MAYO, H. B. MASON, E. L. NEWCOMB, and the Editor-in-Chief of the JOURNAL, General Secretary, Treasurer and Reporter on the Progress of Pharmacy, *ex-officio*.

Editorial Office: 253 Bourse Building, Philadelphia, Pa.

ACTIVITY OF WILD AMERICAN DIGITALIS.

Reprint No. 391 from the *U. S. Public Health Reports* is of particular interest at this time. Martin I. Wilbert had called attention to a neglected source for obtaining digitalis, namely, the collection of the wild-growing plant which has escaped from cultivation and become a weed in various sections of the United States, more particularly in the northwest, where it is found growing in abundance and of the pharmacopoeial variety, *Digitalis purpurea*.

The author of this report, George B. Roth,¹ technical assistant in the Division of Pharmacology of the Hygienic Laboratory, U. S. Public Health Service, in the preliminary remarks, states that in order for these plants to be of commercial importance, it is necessary that the drug come up to pharmacopoeial requirements. This question prompted the investigation of the subject.

The examination concerns the activity of four samples of wild-growing leaves which were collected in Oregon during the season of 1916 and one sample from Washington. For the purpose of comparison, examination was also made of *cultivated* digitalis leaves which were grown in Washington during the season of 1916. The report also includes a sample of the season of 1914 grown in Wisconsin and another in Ohio. Tinctures were made according to the U. S. Pharmacopoeia and their activity determined physiologically by the present U. S. P. method.

All of the Oregon digitalis was collected near Astoria. Sample 1 consisted of leaves gathered from first-year plants about six weeks after the flowering time. They were rather dark in color and the hairs practically free from soil. Sample 2 consisted of leaves from second-year or older plants, about six weeks after flowering time. These were light green

in color. Sample 3 consisted of leaves from flowering plants, and Sample 4 of leaves which had partially dried on the stalk and were yellowish green in color. The largest and best leaves were from plants which grew on moist ground where the plants were shaded about half the day. Too much shade prevents the proper development of the leaves, while long exposure to the sun causes the leaves to turn yellowish.

All of the samples were air-dried immediately after the leaves were collected, except the sample which was dried on the stalk. The process of drying with these samples was as follows: The gathered leaves were spread out in thin layers on floors over which the air could circulate freely and the leaves were stirred frequently, at least every other day. About three weeks were required to dry them thoroughly.

The Washington samples were collected by Prof. A. W. Linton, of the University of Washington, College of Pharmacy. Sample 5 consisted of leaves from plants growing wild near Seattle and were collected in August, while the plants were in blossom. They were air-dried, very dry and brittle and of a yellowish tinge. Sample 6 consisted of leaves from cultivated plants of second-year growth, obtained from the drug garden of the College of Pharmacy. They were collected in November 1916, and were the second growth of leaves for the season. The Wisconsin sample, which is reported on as Sample 7, consisted of leaves from first-year, cultivated Wisconsin digitalis, and collected in 1914 before flowering. They were supplied by Prof. Edward Kremers, of the University of Wisconsin. Sample 8 consisted of leaves from first-year cultivated digitalis grown in Cincinnati, collected in November, and supplied by Prof. John Uri Lloyd.

The first two Oregon samples were assayed

¹ "The Activity of Wild American Digitalis," by George B. Roth. Reprints may be had from Superintendent of Documents, Government Printing Office, Washington, D. C., for 5 cents per copy. (Postage stamps not accepted.)

on a lot of frogs received in October. The other two and those from Washington were assayed on a lot of frogs received in November. All of the samples were assayed on *Rana pipiens*, which were all obtained from the same dealer. Neither the Wisconsin nor the Ohio digitalis was standardized except as to the lethal dose of sample tincture. The first lot of frogs standardized against ouabain showed the lethal dose of 0.00000055, and the other lot of 0.00000045. The lethal dose of standard tincture digitalis of the first two Oregon samples was 0.0066 and of the other samples 0.0054. The lethal dose of sample tincture consecutively was as follows: 0.004, 0.005, 0.004, 0.003, 0.011, 0.007, 0.003, 0.006. The corrected lethal dose of sample tincture is as follows: 0.0036, 0.0045, 0.0044, 0.0033, 0.0121, 0.0077.

From this it will be seen that all the samples of wild Oregon digitalis were stronger than pharmacopoeial sample. The author states that, while this investigation has shown that of the tinctures made from wild-growing digitalis the Oregon samples were several times stronger than that grown in Washington, it should *not* be concluded that wild Oregon digitalis is generally more active than wild Washington digitalis.

It was especially surprising to the author to find that Sample 4, which was made from leaves which had partially dried on the stalk, was the most active of the Oregon samples. These leaves were yellowish green in color and would ordinarily be regarded as leaves of poor quality. The investigation also shows that time of collection has very little to do with the activity. It is also significant that all of the samples were air-dried, notwithstanding that many authorities claim that special methods of drying are necessary to secure a good product. The author concludes that "the wild digitalis which is found in the northwestern states may be utilized as a source of supply for making the various official preparations of digitalis, and that by using ordinary methods in handling and preparing the leaves we may secure a highly active product, which compares favorably with the activity of cultivated leaves grown under more favorable conditions."

Dean Adolph Ziefle, of the School of Pharmacy, has undertaken to collect digitalis in Oregon. A circular issued to farmers and others gives the methods of collecting and drying.

GUIDE TO CHEMISTRY 40.

PLANT CHEMISTRY FOR PHARMACY STUDENTS.

The first edition of this guide was published in 1911 and the present issue is by Nellie Wakeman and published by the University of Wisconsin. Dr. Edward Kremers states in the introduction that this pamphlet is not a text-book or laboratory manual, but merely a guide to both instructor and students.

"It is designed for the pharmacy students of the University of Wisconsin who are required to take plant chemistry as a three-credit study throughout the senior year. For a number of years, this course, together with pharmacognosy, which is given simultaneously as a two-unit hour course, has taken the place of the former course in materia medica.

"In the four-year course, pharmacognosy is preceded by vegetable histology, morphology of the flowering plants, and by general biology; plant chemistry, by pharmaceutical chemistry, inorganic and organic, and by general chemistry, inorganic preparations, organic chemistry, qualitative and quantitative analysis.

"During the first semester, experiments that do not involve a knowledge of advanced organic chemistry are selected, such as the isolation of starch, esterification of fatty and volatile oils, etc. The old-time groups of plant chemical constituents are followed: oleoresins, resins, volatile oils, etc., *i. e.*, constituents that are not chemical units but more or less natural mixtures. During the second semester definite chemical compounds are studied, such as the constituents of the volatile oils, the alkaloids, glucosides, etc."

The guide is divided into fourteen chapters, the first one on "water" and the last dealing with "proteins." The second chapter is on "enzymes" and will serve to explain the plan of presentation:

"The term enzyme is used to designate a class of complex organic substances, of unknown composition, existing in plant and animal tissues, and capable of accelerating chemical action. In the presence of enzymes, also known as unorganized ferments, chemical changes readily occur which would otherwise take place only slowly, or possibly not at all, under the same conditions of temperature, concentration, etc. As a rule the action of enzymes is checked by either increasing or lowering the temperature materially, also by the presence of certain poisons, antiseptics, or anesthetics.

"The chemical composition of enzymes is largely a matter of speculation. So far as is known, they are non-crystallizable substances, generally soluble in water, salt solutions, or glycerin. They are precipitated from their solutions by the addition of alcohol and by some neutral salts, such as ammonium sulphate. Probably an enzyme has never yet been obtained in a pure condition. Attempts at purification usually end in the diminution, or complete destruction, of the activity of the material examined."

Then follows a general classification and sub-classification, concluding with a statement relative to enzyme action. Then follow references, exercises and a series of experiments to be conducted by the student.

COMPILATION OF DIGEST OF COMMENTS ON THE U. S. P. AND N. F. CONTINUED.

The work of compiling the series of Hygienic Laboratory bulletins entitled *Digest of Comments on the Pharmacopoeia of the United States of America and on the National Formulary*, which was interrupted by the illness and death of Technical Assistant Martin I. Wilbert, has been resumed by Dr. A. G. DuMez, who was appointed to succeed the former June 1, 1917. The Digest of Comments for the calendar year ending December 31, 1915, has been completed and is ready for publication, and considerable progress has been made in the preparation of the abstracts for the 1916 bulletin.

A WAR TAX RULING.

C. E. Fletcher, Deputy Commissioner of Internal Revenue, Washington, D. C., has sent out the following ruling:

"Where goods manufactured by a person require further manufacture before being used

by the consumer, *the one completing the manufacture is liable for the tax.* The same rule would apply to bulk goods that require to be bottled or otherwise prepared in order to put them into a salable condition. *Therefore the person preparing the goods in smaller packages and labeling them is the manufacturer within the meaning of the Act.*

"Where a manufacturer prepares a certain article, wrapped and labeled in a salable condition, and for the purpose of advertising will attach the name of any dealer who will handle the same, such a manufacturer is subject to the manufacturer's tax as provided in this section. *The dealer who handles the goods has no interest whatever in its manufacture and his name is simply placed upon the label for advertising purposes.*

"Where a manufacturer prepares an article according to a formula furnished by a dealer and also labels and puts the article into a salable condition, with the dealer's name stamped thereon, such a dealer will be considered the manufacturer, since he holds title to the formula by which the article is prepared."

Dr. A. Homer Smith, at a meeting of the General Medical Board of the National Council for Defense held January 13th, reported on the drug situation, detailing important data regarding chemical glassware, digitalis, alkaloids used in ophthalmic practice, novocaine, mercury, and other drugs. He pointed out the urgent need of supply and conservation, and pleaded for complete coördination of all branches of the Government on all subjects pertaining to drug and chemical need.

Dean Wilbur J. Teeters was unfortunate in having his residence destroyed by fire. Very little of the household goods escaped destruction or damage.

OBITUARY.

IN MEMORIAM.

JOSEPH PRICE REMINGTON.*

1847-1918.

WHEREAS, In the demise of Joseph Price Remington, American Pharmacy has lost its foremost figure and the Philadelphia College of Pharmacy its most distinguished son, therefore be it

Resolved, That we, the members of the Philadelphia College of Pharmacy, in special meeting assembled, express our deep sorrow at his passing and pay tribute to his work and worth.

As a pharmacist, he labored in all the branches of pharmaceutical practice—retail, wholesale and manufacturing, acquiring an unusually wide experience. He graduated from the Philadelphia College of Pharmacy

* Resolution adopted by Philadelphia College of Pharmacy.

in 1866, the subject of his thesis being "Our *Alma Mater*, Its Rise and Progress," little dreaming, perhaps, that he was destined to become a most important factor in the development during the next fifty years.

As an educator, he was trained by Edward Parrish and William Procter, Jr., his teachers, two of the greatest pharmacists that American Pharmacy has produced. In 1874 he was elected to the chair of Theory and Practice of Pharmacy of his *Alma Mater*, later becoming also professor of Operative Pharmacy and director of the Pharmaceutical Laboratory (1877) and then dean of the College (1893). He has taught thousands of students. He was an impressive teacher, presenting his subjects in a logical and practical manner; his language was clear and forcible and his voice distinct and penetrating. He had a magnetic personality and his lectures made a deep and lasting impression. He was the "students' friend," beloved by all. He may have been said to have been a teacher of teachers, for most of the successful teachers of pharmacy in America to-day have been pupils of his at some time in their careers.

Not only this, but he exercised a potential influence upon pharmaceutical education generally, being most active in developing many improvements and important changes in methods of teaching. His method of instruction in operative pharmacy led to the creation of a pharmaceutical laboratory in the Philadelphia College of Pharmacy, the first of its kind in this country, the essential features of which have been adopted by nearly all the colleges of pharmacy in the United States, and he was the first to visualize the importance and necessity of teaching commercial pharmacy in schools of pharmacy and to establish such a course.

As an author of pharmaceutical text-books, he had a national and international reputation. He was the author of the "Practice of Pharmacy," first issued in 1885, used in every college of pharmacy in this country, and widely known abroad; and associate editor of the United States Dispensatory since 1879, the fifteenth edition of which was published in 1883. This edition and the later ones have proved to be the most successful ever issued. Prior to 1883, the work was edited entirely by physicians; since then American Pharmacy has been honored by placing upon the title page of this book the name of a pharmacist as one of its editors and has been properly recognized in its relation to medicine.

As a member of the American Pharmaceutical Association he was most active. Joining in 1867, he served the Association in many capacities, being a regular attendant at the annual meetings, taking a leading part in its discussions and presenting papers on many important subjects, as the volumes of the Proceedings and JOURNAL since 1868 bear ample testimony. His good judgment and safe advice were constantly in demand. He was chairman of many important committees. He proposed the plan which was adopted for the establishment of the Council in 1880 and was its chairman for seven years. In 1887, he elaborated a plan for the reorganization of the Association, dividing the scientific work into sections and secured its adoption. He was president in 1892-93 and permanent secretary in 1893-94.

In 1887, the American Pharmaceutical Association appointed him as a delegate to visit the American Medical Association, and he induced that association to establish a section of *Materia Medica and Pharmacy*, which has since become the "Section of Pharmacology and Therapeutics." He was chairman of delegations subsequently sent to this association, and on such occasions rendered valuable services in bringing the professions of medicine and pharmacy into closer relationship.

Not only in national pharmaceutical affairs was he active, but he took a deep interest in the growth and development of the state associations, frequently attending their annual meetings, making addresses and presenting papers. He was one of the charter members of the Pennsylvania Pharmaceutical Association in 1878 and its president in 1890.

As an executive and leader of men he had international fame. He was president of the Seventh International Pharmaceutical Congress (1893), a delegate to the Pan-American Medical Congress (1893) and the second Congress in Mexico (1896); represented the United States in the Eighth International Pharmaceutical Congress at Brussels (1896) and was president of the pharmaceutical section of the Eighth International Congress of Applied Chemistry (1912). He received the honorary degree of Master of Pharmacy from the Philadelphia College of Pharmacy and the Northwestern University of Illinois. He was a fellow of the Chemical, the Linnean and the Royal Microscopical Societies of Great Britain; and honorary member of the *Pharmaceutische Gesellschaft zu St. Petersburg*, *Institute Medico*

Nacional de Mexico, Societe Royal de Pharmacie de Bruxelles, Societe de Pharmacie d'Invers; an active member of the American Philosophical Society, American Chemical Society, American Geographical Society, Academy of Natural Sciences of Philadelphia, Historical Society of Pennsylvania, Pharmaceutical Society of Great Britain, British Pharmaceutical Conference, and a member of the Federations *Internationale Pharmaceutique* of The Hague, Franklin Club of Philadelphia, Chemists' Club of New York and Authors' Club of London.

But his greatest work probably was as chairman of the Committee of Revision of the Pharmacopoeia of the United States of America, a work which has become of vast importance by reason of its legal standing under the Federal and State Food and Drug Acts. His connection with the U. S. Pharmacopoeia began in 1877, when he served on an auxiliary committee of revision. In 1880, 1890 and 1900 he was sent as a delegate of the Philadelphia College of Pharmacy to the national conventions and in these served as first vice-chairman of the final committee of revision. Upon the death of the chairman of the committee in 1901, Professor Remington was made chairman, and was again elected in 1910, holding the position until his death. The ninth revision, issued in 1916, may be truly called his monument, since the whole work is stamped with his personality.

As a man, "we ne'er shall look upon his like again. Genial, eloquent, clean-hearted and clear-minded," possessed of unusual natural ability coupled with rare executive capacity, he served his day and generation, loyally and enthusiastically, and left a record of achievement that may well serve as an example to future generations.

Just a personal note: Professor Remington was gifted with a charming personality. His courtesy, his tact, his ability to adapt himself to all types of people, made friends of all those he met, while his strong, clean intellect served to inspire them. The meaning of his departure from life may be expressed in the words of S. Weir Mitchell's poem, "Evening," in which is said:

"I know the night is now at hand,
The mists lie low on hill and bay,
The autumn sheaves are dewless, dry,
But I have had the day.
Yes, I have had, dear Lord, the day;
When at Thy call I have the night,
Brief be the twilight as I pass
From light to dark, from dark to light."

Resolved, That this appreciation be entered upon the minutes of the Philadelphia College of Pharmacy, and a copy sent to the family of the deceased.

J. W. ENGLAND, *Chairman*,
SAMUEL P. SADTLER,
CHARLES H. LAWALL,
JULIUS W. STURMER,
HARRY K. MULFORD,

Philadelphia, January 4, 1918 *Committee.*

GEORGE M. BERINGER.

In the decease of Professor Joseph P. Remington, American pharmacy has lost its most renowned advocate and its most eminent teacher. During the past quarter of a century, no other individual has occupied such a commanding position or exercised so great an influence in matters pharmaceutical.

Gifted by nature with superior qualifications, with a laudable ambition and an upright character, with keen perception and good judgment, by a determined will and self-application and study, he steadily advanced through all the stages of a pharmacist's career from apprentice boy to the leadership in his profession. Well deserved were all the honors that were accorded to him both at home and abroad.

As a pharmacist, as a teacher and as an author, his efforts were continuously directed toward the advancement of his chosen calling. As a teacher he was preëminent, gaining not only the attention to studies but, by his genial personality, likewise, the esteem and affection of his students. By his moral as well as technical instruction, he inculcated deeply in the minds of thousands of pharmacy students the ethics of the profession and a realization of the duties and responsibilities of its followers. These impressions through their example and life will continue an ever-broadening influence. His text-books are the accepted authorities for the teaching of pharmacy and will perpetuate his work and usefulness.

As chairman of the Committee of Revision of the United States Pharmacopoeia he demonstrated to the best advantage one of his greatest characteristics, namely, his ability as a leader and harmonizer. The problems associated with the revision of the Pharmacopoeia were numerous, and trying was the position of the chairman. It was greatly to his credit that satisfactory conclusions were reached in practically every matter and to him must be given due share of credit for the notable advances that have been made in the

two revisions that appeared under his chairmanship. Truly, he has left a monument in the services rendered to his fellow-men.

To this noble spirit who by Divine command has completed his earthly labor and who in the zenith of his power has passed on to eternity, we acknowledge our indebtedness as individuals and as a world benefactor. We will ever honor and cherish his memory and revere his example.

FREDERICK J. WULLING.

I first met Professor Remington in 1885 at the New York College of Pharmacy in its old building on East 23rd Street near Third Avenue on the occasion of one of his frequent visits to Prof. P. W. Pedford, whose lecture assistant I was at the time. The occasion is still very clear in my mind and I well remember the genial and cordial fraternal greeting and advice he gave me at the time. Shortly before, I had come into possession of his "Practice of Pharmacy" and in its study had acquired a profound regard for the author, marveling, in my youthful enthusiasm, at the learning of a man who could write so voluminous and comprehensive a work. To meet so distinguished and able an author and teacher was to me at that time and would be to-day a distinct honor. That the professor was so genial and approachable a man came to me as a most pleasant surprise. I have realized since that one of his chief charms lay in his friendly and sincere interest in the struggling student. He saw in every student the potential qualities of a leader in pharmacy. He told me frequently that he regarded it a privilege to be a teacher of young men and women for he regarded them with himself as co-trustees of the profession he loved so well. His popularity was due more largely to the esteem in which students held him than to any other one factor, not excluding his important work in the revisions and development of the Pharmacopoeia.

During my thirty-two years of co-work with him in the cause of better pharmacy, the sincerity of our friendship grew constantly and that despite the fact that for the past twenty-five years we differed materially on the questions of higher academic and professional requirements for professional pharmacy. The professor could never quite agree with my convictions that it is the duty of pharmacists in high positions to use their influence and power to the utmost degree to advance educational standards to a point

commensurate with the value and dignity inherent in so responsible a calling and service as pharmacy. I feel that his unquestioned and profound affirmative influence on pharmacy could have been even greater had he shared these convictions. But American pharmacy and its posterity will ever feel grateful for his very large share in its uplift and development. His departure from this mundane life leaves a distinct void. His many friends have suffered a great personal loss and pharmacy at large an irreparable one. His place and influence in American pharmacy is assured for all time and as the years will lend perspective to his life and work posterity will appreciate him even more greatly than his contemporaries did.

JOHN G. GODDING.

The passing away of Prof. Joseph P. Remington removes from the American Pharmaceutical Association one of its widely known members. His ability as a teacher, author and collaborator on the United States Pharmacopoeia made him one of the best known in American pharmacy.

The completion of the U. S. P. IX of which he was chairman of the Revision Committee, to quote his words, "The best Pharmacopoeia in the world," was the rounding out of an active life devoted to pharmacy. It was the writer's privilege to meet the professor at the annual meetings of A. Ph. A. and enjoy his companionship traveling in the many varied trips to the Association conventions. Thus passeth another friend.

J. W. ENGLAND.

The outstanding features of Prof. Remington's personality were, it seems to me, three in number—his unusual ability, his unusual force of character and his unusual courage.

His ability was inherited and acquired. He had a keenly retentive memory, and a fine, discriminating judgment in appreciating the relative values of facts. He was exceedingly painstaking in his consideration of details. He had a deep knowledge of the science of his profession coupled with rare executive capacity, an unusual combination of scientist and executive; and he knew, as no other, the possibilities and limitations of every active research worker in American pharmacy. He had practical experience in all the branches of pharmaceutical practice—the retail, wholesale and manufacturing, and acquired thereby unusual breadth of view.

His force of character was unusual. Strong and positive in his opinions, he was not hasty in forming them, and was tolerant of the opinions of others, and exceedingly patient. His anxiety was to be right in his decisions and to "play fair" with his opponents. He believed that might may win for the moment, but that right, eternal right, which is only another name for Truth, triumphs through the centuries. He never grew "stale." He always kept young by associating with young people.

He had unusual courage. At a meeting of the Board of Trustees of the Philadelphia College of Pharmacy held last spring, I asked Prof. Remington as to his physical condition and expressed my sympathy. He replied "I am near the end of my life!" He said this calmly and with a smile. He was "At the End of the Trail" as exemplified by the wonderful status of that title at the San Francisco Exposition typifying the final extinction of the Red Man—the Indian on a pony, both "all-in," utterly exhausted, incapable of going further, at the brink of a precipice overlooking a dark valley. And the point is, he spoke of his "passing" without a trace of fear—with a smile on his lips and immortality in his eyes. He was unabashed and unafraid of Death, ready to go down into the Dark Valley and face his Maker! This was courage, real courage, unusual courage. And such a courage he exhibited time and time again in the crises of his life.

C. A. MAYO.

The death of Professor Joseph Price Remington removes the most prominent figure from the field of American pharmacy. Others have won reputation for themselves by good work in some one particular phase of pharmacy, but no one name in pharmacy is so well known in America or in the English-speaking world as a whole as that of Professor Remington. Indeed his name is known not only in the English-speaking world, but throughout the civilized world as a leader in pharmacy. His death will bring grief to thousands of friends in Europe as well as in America. He leaves behind him a monument to his skill as an editor and his knowledge of pharmacy in his "Practice of Pharmacy," the sixth edition of which made its appearance almost coincident with his death, and in the ninth revision of the Pharmacopoeia, the labor on which was probably indirectly responsible for his illness. But above all he leaves in the

hearts of his friends in pharmacy, and their name is legion, grief which time can not assuage, and a profound sorrow at the loss of a man of such wide knowledge, great skill, sound judgment, deft diplomacy and lofty ideals. As a teacher he was an inspiration, as an editor and a coördinator of the work of others, he was a master; as a director in association affairs, he was the essence of diplomatic tact and an able and a wise stabilizer; as a man he was pure in mind and had a positive genius for friendship binding his friends to him by countless evidences of considerate kindness. Pharmacy and pharmacists lose much by his death.

H. W. WILEY.

I have known Doctor Remington intimately for over a third of a century. I have been professionally in touch with him constantly during the ninth revision of the U. S. Pharmacopoeia. His death, therefore, to me is both a personal and professional loss.

I think few will deny Professor Remington's hegemony in pharmacy in the United States, and we may well claim it also in the pharmacy of the world. His was a life of industry. He never flinched by reason of the tasks imposed upon him. He was a glutton for work. The extent of his knowledge outside of his chosen profession was phenomenal. As a teacher he had few equals. He was a voluminous author. He received all the honors which American pharmacy has to offer. He bore them with becoming simplicity. He was never dogmatic or imperious, but always diplomatic and tractable. If Louis the Fourteenth could say "*L'Etat c'est moy*," with equal justice we can say "*La Pharmacopoeia c'est lui*."

As a friend he was incomparable. His hearty laugh gladdened every social function which he honored with his presence. As an after dinner speaker, he was always excellent, pertinent and concise. In his public addresses he was enlightening, entertaining and didactic. Doctor Remington lived the allotted term of life. He was three score and eleven at his death. It may not be true that the good die young, but it is true that the good die young no matter how long they live. Doctor Remington died young. He died as he had lived, true to the highest ideals of manhood.

S. SOLIS COHEN.

It is hard, while our loss is recent and our grief acute, to pen a just estimate of Joseph Remington. The love and veneration in

which he was held by the many thousands of his students, the sincere affection that was joined with the respect and admiration of his colleagues in pharmacy and in medicine, the universal esteem of the community, testify to the high character and the noble qualities of the man.

The value of his scientific and pedagogic work can only be appreciated by those who knew what pharmacy and pharmaceutical teaching were when he began his career as a teacher and can contrast these with the heights to which they have now attained and the upward path opening before them. To this great advance, Professor Remington contributed in no small measure; and many of those most active and efficient in the work have been inspired by his word, taught by his example, and encouraged by his sympathetic recognition and assistance.

His work on the *Pharmacopoeia*, and especially the Ninth Revision, speaks for itself. Of this last book, it is not too much to say that but for the tact, the patience, the wisdom, the broad knowledge, and the sincerity of Joseph Remington, it might have "died aborning," and although it is not in all respects the book he wished it to be, yet he succeeded in carrying it far toward his ideal. To those who know its value and all that it stands for in scientific pharmacy and practical medicine, it is no unenviable monument to the great man whom we were privileged to call friend, and whom we sincerely mourn.

FREDERICK B. POWER.

It is my sad privilege to record in this place a brief but heartfelt personal tribute to the memory of the late Professor Remington. It is difficult to realize that he has passed from us, and that his genial and kindly presence will no longer be seen among men.

Among the professional friends of Professor Remington, there are probably few now living who can look back upon a longer acquaintanceship with him than the writer of these lines, for it had extended over a period of nearly half a century. It was in the spring of 1872, while engaged in the pharmacy of the late Prof. Edward Parrish, at Eighth and Arch Streets, Philadelphia, that I first met Mr. Remington, who was then in the service of Messrs. Powers and Weightman of that city, and, it may be noted incidentally, it was in the same year that I became a member of the American Pharmaceutical Association. At that time the instruction in the Philadelphia

College of Pharmacy was restricted to evening lectures during a period of about five months, from October to March, and Mr. Remington was then a lecture assistant to Professor Parrish, but he also conducted an evening class in pharmacy during the summer months, of which I was a member, and I still cherish a happy recollection of all the associations connected with those early days. On account of the sudden death of Professor Parrish in the summer of 1872, Professor William Procter, Jr., who had previously retired from active service in the college, was called to take his place, but Mr. Remington still retained the position of lecture assistant, and, in the demise of Professor Procter, at the close of the lecture session in 1874, was elected to the professorship of pharmacy, the duties of which he so long and faithfully fulfilled. Many changes have naturally taken place during this long interval of years, and but few now remain of the group of worthy men who in my youthful days were the recognized leaders in American pharmacy.

Within the past two decades it was my privilege to meet Professor Remington on several varied and happy occasions, such as the meeting of the International Pharmaceutical Congress held at Brussels in 1897, and at the opening of the session of the School of Pharmacy of the Pharmaceutical Society of Great Britain, in London, in 1913. On the latter occasion, he was accompanied by his friend, Professor Julius A. Koch, and his almost youthful buoyancy of spirit, which was so marked a characteristic of his nature, was observed then to be still retained. My last meeting with the departed friend was in the closing days of December 1914, when I enjoyed the hospitality of his home in Philadelphia.

It would seem needless to remark how greatly Professor Remington will be missed, not only at the college with which he had so long been connected, but in all pharmaceutical circles throughout the land, and the news of his departure from this life will have been received by the almost countless number of friends and former students with a deep sense of personal loss.

WILBUR L. SCOVILLE.

It is very difficult to speak in any adequate manner of Professor Remington. His loss is personal, professional and international. Great numbers of us will not try to decide which loss is the greater. As a personal friend he was big enough for all lovers of pharmacy.

Not merely his own students and associates, but every advocate of the higher in pharmacy found in him an inspiration and also a human personality that attracted. His personal charm was a rare quality, and a large factor in his influence.

Professionally he was the diplomat of pharmacy. His tact, judgment and ideals enabled him to accomplish much for the advancement of professional pharmacy. He was in touch both with the commercial and the professional phases. He was shrewd in his judgments and loyal to ideals. His insistence on a recognition of commercial demands upon pharmacy is a factor that may appear of more importance in the future than it has in the past. Here he exercised an influence on the pharmacy schools which some have deplored and some have praised. Perhaps neither extreme is best, but if the mean is to be attained—and is the wiser part—both sides need their advocates, and there have been few strong educators who could keep a hold on the commercial as well as the purely professional phases of pharmacy.

As dean of the Philadelphia College of Pharmacy, as president and a long-time leader of the American Pharmaceutical Association, as chairman of the U. S. P. Revision Committee, and as delegate to numerous other societies, both here and abroad, he was the most diplomatic representative of pharmacy. Space forbids the relating of interesting illustrations of his sagacious meeting of difficulties. Doubtless our literature will show many of them in future reminiscences. He was usually ready, he knew how to use humor, he was astute in attacks and discreet in doubtful conditions, a real diplomat.

He is lost to the present, but not to the past or to the future. He moulded pharmacy during his life, and his influence will continue into the future. He is gone, but not lost.

L. E. SAYRE.

It is impossible, for one who has felt himself, from his college days, Professor Remington's very close friend and associate, to put into word his innermost thoughts concerning him. We studied together and our college interests were the same. Since 1885 I have been rather far removed from personal contact and, for this reason I think, I have appreciated him—at this distance—more than his contemporaries at home. There was something truly great in Professor Remington; he had a brilliant mind and it was truly sound, embracing equally

great and small things. I often wondered, when I had the pleasure of meeting him with his associates at the annual pharmaceutical conventions, whether these familiar associates appreciated his greatness as much as I. Egotistical as it may seem, now that he is gone, I can not help but feel that I knew *his greatness best*, partly because of the conditions mentioned.

H. V. ARNY.

Among the many tributes now being laid at the bier of Professor Remington, I desire to add a tribute of gratitude. Few men did more for me than did my great teacher, who did much to change the callow youth into a thinker. How we boys of thirty years ago revelled in the delightful lectures of Professor Remington, who illumined every necessary fact with a merry jest, a clever phrase or a bit of homely philosophy. How we admired Remington the man; the kindly one who was always ready with words of encouragement.

And so it has been ever since. Always courteous, always ready to serve his "boys" scattered throughout this great Republic, he drew to himself an admiring following, the like of which is scarce likely to be found again in American pharmacy.

And so in these hours when we feel most keenly his loss, we can at least be thankful for one thing. Each of us who loved him can say "I am rich in having known him."

OTTO RAUBENHEIMER.

During the International Congress of Applied Chemistry, held in New York City in September 1912, at which Professor Remington was chairman and the writer secretary of the Section on Pharmaceutical Chemistry, I had the good fortune of becoming intimately acquainted with the "Great-Master" of Pharmacy in the United States. Not only did I get thoroughly impressed, but also convinced of his wide knowledge, his lofty ideals, his true love for pharmacy, his unselfishness and his noble character. These properties were greatly admired by all who came in touch with him.

The pharmaceutical as well as the medical profession will be forever thankful to Remington for the splendid manner in which he, as chairman, carried on the revision of the U. S. P. IX. He deserves special credit for harmonizing the frequently conflicting views of the two professions. Truly his wish, which he expressed in the U. S. P. convention in Wash-

ington in 1910, was fulfilled, to make this work "the peer of all Pharmacopoeias."

Remington was the foremost figure in American pharmacy. His fame was not only local, but national, in fact, international. Although he departed, three monuments will remain which will forever remind the pharmaceutical, chemical and medical professions, as well as the Government officials, of Remington, namely, the U. S. P. IX, his "Practice of Pharmacy" and the U. S. Dispensatory.

Let us hope that the name "Remington" will be an everlasting inspiration to the pharmaceutical profession!

SEWARD W. WILLIAMS.

The great loss pharmacy has suffered in the passing on of Professor Remington falls as a personal bereavement on each of us who were privileged to know him well. Way back in our early pharmaceutical training, and ever since, Remington and Pharmacy have been as nearly synonymous as man and profession could be.

He will live in fond recollection as long as memory lasts. He will live in the great books which we regard as the "Scriptures" of pharmacy. He will live in our lives, which should be lengthened by his precept and example; for was there ever a man who had better solved the problem of balancing work and relaxation? But perfect as his balancing of work and play seemed to those of us who enjoyed his genial humor and good fellowship, as on long trips to A. Ph. A. conventions, he carried too heavy a load; for the profession— for us.

His three score years and ten were crowded with a century of service. He has paid "the last full measure of devotion." Words fail to express our sorrow, our admiration, our gratitude.

JOHN F. HANCOCK.

Professor Remington and I were close friends since 1876 and this friendship continued to the close of his life. I first met him in Richmond, in 1873, at the meeting of the American Pharmaceutical Association. Three years later I met him at the World's Fair in Philadelphia, and we were much together at that time and our close friendship possibly dates from that period. I confided in his judgment. He had a rounded, genial disposition and was companionable. He is a great loss to pharmacy and the Association, but he will live in the memory of those who survive him

and will continue to serve as a beacon light to those who enter pharmacy.

E. FULLERTON COOK.

Those of us who were close to the home life of Prof. Remington have known for months that he was critically ill, yet, when the reality of his death came upon us, the shock was no less than to the many friends who then learned for the first time of his illness.

This was probably due to that quality which has been a dominant factor in his career, namely, his unswerving faith that victory must come and his unwillingness to accept or acknowledge defeat, no matter how dark the outlook and he never gave up hope of regaining his health. This strong will carried him through the last year of hard work on book revision, kept him at work on the manuscripts for months after he took to his bed, and perhaps kept him here to fulfill his ambition to see and hold a copy of the new "Remington" and to know that the Dispensatory was on the press.

But as many will write of his scientific achievements and of those splendid qualities of friendship, leadership and teaching ability evidenced throughout his many years of active service in the profession he loved, I shall confine these few words of tribute to those more intimate and personal qualities which it was my good fortune to know through years of friendly relations, almost as intimate as those of father and son.

One of the outstanding facts and influences in his life has been a deep religious conviction and a faith in the guidance of the Divine Spirit. Many problems, personal and business, were settled only after leaving them, as he would say, for "the Voice to show the way." This custom made his decisions preëminently just and usually right and probably explains the reason for that confidence in his judgment shared almost universally by his colleagues.

His interest in the little church at Longport, where he gave so many years of loyal service in every capacity, even to that of lay-reader on occasion, his work for young men as Bible Class leader, head of the Brotherhood and as vestryman at Holy Trinity, Philadelphia, and his ever-present sense of responsibility for the students' moral welfare, are but other evidences of the spiritual side of his life.

Another quality which made an impression upon those close to him was the desire to be fair and entirely above reproach in all of his dealings with associates, and especially in the responsible offices to which he was chosen.

In pharmacopoeial work he tried always to give every member the fullest opportunity to place his views before the Committee, and, on numerous occasions reopened questions when some member expressed dissatisfaction or desired to present a new argument. The purpose was always to arrive at the right solution.

His interest in text and reference books which used pharmacopoeial facts, often placed him in an embarrassing position, since it might be thought that he had taken advantage of the opportunity to obtain information in advance, for his personal benefit. His stand on this question was fixed and definite although it meant a financial loss, but he felt that the honorable fulfilment of his duty to the Pharmacopoeia required his undivided attention until its problems were settled and the manuscript and proof reading entirely out of his hands. Then, and then only, would he take up the revision of his own books and the time elapsing between the appearance of the U. S. P. and the publication of the other books, about two years, in both the Eighth and Ninth Revisions, bear evidence to this policy.

His sense of humor and story-telling ability was one of the charms of his companionship, and yet here was brought out a fine quality of mind. His stories were always clean and they never carried a sting or hurt. He detested the "practical joker" and had no sympathy with the man who retailed immoral stories.

While the passing of this brilliant life has left a vacancy hard to fill, the one thing he has tried to do has been to instill his own faith in the future of pharmacy in the minds and hearts of many whom he was privileged to know and he had faith to believe that the cause he loved would "carry on" and thus, his greatest work as an inspirational teacher, be accomplished.

JULIUS A. KOCH.

Professor Remington was indeed a lovable, whole-souled man, always enthusiastically on the lookout for some means of advancing his chosen profession. His enthusiasm was the constant source of inspiration to those with whom he was in contact.

Ever keenly alive to what was going on around him he made a most delightful traveling companion and my close association with him for two months in the fall of 1913, on our trip to Europe to attend the Eleventh International Pharmaceutical Congress at the Hague, will always be to me the source of most delightful memories.

H. M. WHELPLEY.

In these stirring times of intense mental strain we are prepared for startling news. The announcement of the death of Joseph Price Remington is startling, even though not unexpected. It is startling because it causes us to realize how brief is the notice as we approach the passing of one who has been foremost as a representative of American pharmacy for more than a generation. It is startling because it brings home to us what can be accomplished by a single individual who industriously makes use of natural ability. It is startling because we see how quietly great changes take place and the work in any particular line of human activity goes on with little interruption. It would be useless to try to review the work of such a man in a brief paragraph. I must, however, point out that what man has done, man may do and the field is before thousands of young men in pharmacy today who have the life and work of Remington given them as an incentive.

J. W. STURMER.

American pharmacy has produced its fair quota of eminent men—scientists, teachers, writers, men of affairs; but the name which will stand out in bold relief through the years to come, is the name of the distinguished pharmacy teacher who so recently laid aside the crayon and the pointer of the class room, and folded his hands in rest—Professor Joseph Price Remington.

His life spans the epoch of transformation during which the old-time apothecary passed into history, and modern pharmacy in its various branches came into being; and during all these eventful years Professor Remington was a power which made a lasting impression upon American pharmacy.

Nature had endowed him splendidly: a commanding presence, a clear, pleasing voice, cordiality of manner, good nature, and a smile which was contagious—in short a magnetic personality. In his addresses he coupled logical exposition with humor and wit, and on occasion thrilled his hearers with fiery bursts of impassioned oratory. Naturally, he was a leader. Naturally, in the class room, he was a stimulating force—a catalytic agent who succeeded in energizing his students to study and to work. And throughout this broad land there are thousands of former students of this extraordinary teacher doing worth-while work—compounding, manufacturing, testing, inventing, writing, teaching—who

trace their inspiration to his lectures. The service which Huxley performed for biology, and Tyndal for physical science, Professor Remington rendered to pharmaceutical science; he popularized it, gave it human interest, gave it life.

But it is not my purpose to marshal in review his many achievements. It is but my humble desire to pay a tribute to a man who was great—and whose fame rests upon his service to pharmacy. As long as illness and pain is the common portion of the sons of men, there will be work for the makers of medicines; and therefore the name of Professor Joseph Price Remington, the great pharmacy teacher, will endure.

Some men attain to eminence, and are admired. Others, not so generously endowed with those attributes which make great accomplishments possible, are lovable because of their warm sympathies and their kindness of heart. Professor Remington was both admired and loved. And his many, many dear friends are sad at heart, and feel that their personal loss is great. They will not only perpetuate his name, but will cherish in loving remembrance his charming personality.

A. R. L. DOHME.

Pharmacy has suffered great losses during the past year. Many of her greatest lights have gone out. Many a familiar face that was greeted so gladly and cordially by us at our annual meetings will not answer the roll-call this year. The Grim Reaper has cut a wide swath in the field of pharmacy's choicest plants. Prominent and last among those who have passed to the great beyond has been that great disciple of Procter and Parrish upon whom both these founders of American pharmacy concluded to lay their mantle of leaders when they passed away—Joseph Price Remington. They judged wisely when they handed him the torch of American pharmacy and chose him as the leader to keep it lighted and carry it on down the avenue of time along the pages of history. The torch was not very large nor was it burning very brightly when it was transmitted into the hands of Remington in the seventies. He was a born leader however, a born organizer and an indefatigable

worker, and on January 1, 1918, when he passed it on after more than forty years of stewardship, it had grown in size and its light was burning more brilliantly than ever before in its life's history. Upon whose shoulders he has put his mantle and into whose hands he has passed the torch is as yet mystery, but will become evident before many years have mapped their course.

Professor Remington's life-work was pharmacy and the Pharmacopocia, and pharmacy and the Pharmacopoeia owe him a great debt of gratitude for that great work. I will always remember Prof. Remington by what was to my mind his predominating trait—his geniality. No matter what the provocation or occasion, his greeting and his state of mind were always genial to a degree, and in consequence he counted among men a host of friends all of whom will mourn his loss as will pharmacy.

CHARLES H. LAWALL.

When the historian of the future comes to sum up the pharmaceutical progress of the 19th century and the beginning of the 20th, no name will stand out more clearly as an exponent of progress in its broadest sense than that of Joseph Price Remington, who for fifty years has been identified, not only with Philadelphia pharmacy and American pharmacy, but with the pharmacy of the entire civilized world.

He had been honored by foreign associations to a greater degree than any other American pharmacist, yet he never lost his interest in the little every-day problems of his chosen profession.

Proud as he was of his lineage he never obtruded the fact nor gave evidence of the snobishness often found in the near-great. He was an inspiration and an encouragement to thousands of students who listened with appreciative interest to his lectures. His insight was keen and his judgment phenomenal in matters of great or little moment.

It is too soon to place a correct estimate of value upon his services to his profession, but to those who were close enough to know him well, his true worth will be ever heralded and the purity and sincerity of his life and motives made public.

SOCIETIES AND COLLEGES.

PHARMACY REPRESENTATION IN
BUREAU OF CHEMISTRY AND
INTERNAL REVENUE DEPART-
MENT.

At the last quarterly meeting of the Executive Board of the American Druggists' Fire Insurance Company, Dr. J. H. Beal presented the following timely resolutions, that should receive the endorsement and support of all organizations of the drug trade:

RESOLUTIONS.

WHEREAS, It does not appear that at the present time there are experienced and practically trained representatives of the drug manufacturing and selling industries connected with the U. S. Bureau of Chemistry or with the U. S. Bureau of Internal Revenue, both of which bureaus are charged with the interpretation and administration of laws applying to the manufacturing and selling of drugs and medicinal products; and

WHEREAS, The just and equitable interpretation and application of such laws frequently involves the consideration of technical questions which can be properly answered only by those who have had technical training and practical experience in the manufacturing and selling of drugs and medicinal products; therefore be it

Resolved, That we recommend that the various associations and societies representing the several divisions of the drug trade bring the above statements of fact to the attention of the proper authorities at Washington and urge upon them the appointment in the Bureau of Chemistry and in the Bureau of Internal Revenue of one or more representatives familiar by practical experience with the manufacturing and handling of drugs and medicinal products and of the material used therein.

AMERICAN METRIC ASSOCIATION.

The second meeting of the American Metric Association was held in Pittsburgh in conjunction with the meeting of the American Association for the Advancement of Science on December 28 and 29, 1917.

The sessions on the afternoon of the 28th and the morning of the 29th were held in conjunction with the Section on Social and Economic Science of the A. A. A. S. and at these sittings papers on standardization were read by J. W. McEachren, of the Crane Company,

Chicago, and by F. O. Wells, of the Greenfield Tap & Die Co., Greenfield, Mass. In his paper, Mr. Wells pointed out that he employed 1700 hands and that he calculated that he would save \$100,000 by the introduction of the metric system. Other papers were read by W. C. Wells, of the Pan-American Union, who discussed measures of volume in metric and other measurements, and by H. T. Wade, who pointed out the importance of the metric system as a means of international standardization.

The session held on the afternoon of the 29th was presided over by Dr. John H. Brashhear, of Pittsburgh, and was devoted to reports from President George F. Kunz, Secretary Howard Richards, Jr., and Treasurer A. P. Williams, showing the healthy condition of the association. Fred R. Drake read the report of the executive committee and outlined the activities of the Association in the way of publicity and of coöperation with other national bodies. Dr. H. D. Hubbard, of the Bureau of Standards, gave an interesting address in which he pointed out some of the fallacies of anti-metric arguments.

In the evening was held a metric dinner with a menu based on war-time conditions, the gramme calories of each viand being expressed in units. At the close of the meal impromptu addresses were made, followed by an election of officers, resulting as follows: *President*, G. F. Kunz, of New York; *Vice-Presidents*, William Jay Schieffelin, of New York, E. P. Albrecht, of Philadelphia, and H. V. Army, of New York; *Secretary*, Howard Richards, Jr., of New York; *Treasurer*, A. P. Williams, of New York.

NATIONAL PHARMACEUTICAL SERVICE ASSOCIATION.

Out of respect to the memory of Prof. Joseph P. Remington, who died January 1st, no meeting of the National Pharmaceutical Service Association was held during January.

Much has been accomplished by the Association for the support of the Edmonds Bill in the past seven months of its existence. Starting with a membership of twenty-seven, the roll of the Association has grown to seven hundred, and a large number of applications are now on hand. Monthly meetings have been held on the second Monday or Tuesday of every month since June 1917, and among the speakers at these meetings were Congress-

man George W. Edmonds, who introduced H. R. 5531 into the House, Dr. H. P. Hynson, of Baltimore, Mr. C. A. Mayo, of New York, Mr. Samuel C. Henry, now of Chicago, and Doctors J. Madison Taylor, F. E. Stewart, and John R. Minchart, of Philadelphia, and Mr. George M. Beringer, of Camden. Some of the papers presented by these speakers have been issued in pamphlet form, and distributed to the members and to the pharmaceutical and medical press.

Shortly before the Edmonds Bill was introduced, a committee of the Association, consisting of Messrs. Geo. M. Beringer, J. W. England, E. G. Eberle, and S. L. Hilton called upon Surgeon-General Gorgas of the United States Army to urge the formation of a Pharmaceutical Corps.

This committee was well received, and four medical officers were detailed by the Surgeon-General to hear their case. At the conclusion of the Conference, the Committee was invited to present to the Surgeon-General a brief summing up the arguments which had been advanced in favor of the creation of a Pharmaceutical Corps in the Army. This was done, and the brief has been published in a number of pharmaceutical journals, thus being given wide publicity.

The only source of income of the Association thus far, with the exception of one or two donations, has been the membership fees, which amount to \$1.00 for each member. The money thus collected has been used in carrying on an active propaganda in favor of the Edmonds Bill, and for increasing the membership of the Association. It is felt that the influence of this Association will be directly proportionate to the size of the membership.

It has not been the policy of the National Pharmaceutical Service Association to interfere in any way with the working of any other national, state, or local association. Since its organization, the central theme has been coöperation. It is a very difficult matter to educate and energize the 100,000 or more pharmacists in the United States to the point where they will take it upon themselves to write their Congressmen, urging the passage of the Edmonds Bill, and to enlist the support of laymen, physicians, and other professional men in behalf of recognition for pharmacy in the Army. However, this is the task which the National Pharmaceutical Service Association has imposed upon itself, and with the help of other associations, as

well as individuals, the task can be accomplished. Literature has been sent to every member of the American Pharmaceutical Association, to every member of the Pennsylvania and New Jersey State Associations, and, through the good offices of Secretary Edwin L. Newcomb, of the Minnesota State Association, propagandic material and membership application blanks have been sent to the pharmacists of Wisconsin, Minnesota, Iowa, North Dakota, South Dakota and Montana. Letters have also been sent to the secretary of every state pharmaceutical association, informing him of the work being done, and inviting coöperation as well as offering assistance for supporting the Edmonds Bill.

The pharmaceutical journals have given freely of their space to this movement, and through this publicity a great deal in the way of personal activity on the part of individual pharmacists has resulted.

It is planned by the House Committee on Military Affairs to hold a hearing on this bill in the near future at Washington, and as soon as Congressman Edmonds has made the necessary arrangements for a hearing, the various associations will be notified, and it is to be hoped that representatives will be sent to Washington to argue in favor of this measure. The passage of this bill would be the biggest thing that has been accomplished for professional pharmacy in many years, and it is essential that the highest type of representatives of the body pharmaceutic be sent to the meeting. Doubtless a conference of the delegates will be held at Washington before the meeting, and spokesmen will be selected. Everyone, however, can contribute arguments in favor of the bill, and lend encouragement to the speakers, and impress the Committee on Military Affairs by his presence.

The National Pharmaceutical Service Association invites pharmaceutical bodies to coöperate in this movement, and to join as individuals so that the funds may be made available for continuing the needed propaganda. Individual pharmacists can accomplish much by speaking to the newspaper men in their home cities, who will doubtless be glad to give the matter editorial notice. Information for newspapers can be had from the secretary on request. Every pharmacist in the United States has a distinct duty to perform in connection with this work:

1. He should write his U. S. Representatives and Senators, asking for their vote for the bill.

2. He should send a telegram to the Committee on Military Affairs, stating that it is to the best interests of men in the service to have the Edmonds Bill passed.

3. He should acquaint all his friends in civil life with the fact that pharmacy in the Army is not being practiced by pharmacists, and that the safeguards which are thrown around the dispensing and compounding of drugs in their own state are absolutely ignored in the army camp.

It is to be hoped that all of the pharmaceutical interests will combine to send this very necessary measure "over the top." If this is accomplished, there will be enough credit to go around. The thing to do now is to keep everlastingly at it, and achieve success.

The coöperation of every pharmacist is necessary.

ROBERT P. FISCHELIS,

Secretary.

OHIO BRANCH NATIONAL PHARMACEUTICAL SERVICE ASSOCIATION.

The National Coöperative Organization to secure the establishment of a Pharmaceutical Corps in the U. S. Army has done effective work, and we are advised that this active body, of which Dr. Frank Cain, of Cincinnati, is secretary, contemplates organizing permanently as the Ohio Branch of the N. P. S. A. This body has sent out much literature and secured recognition from the press. Among the active members are: Dr. John H. Landis, Health Officer of Cincinnati; Dr. E. O. Smith, President Ohio State Medical Association; C. H. Thiesing, President Ohio Pharmaceutical Association; H. J. Dusterberg, President Ohio Valley Druggists' Association; Theodore D. Wetterstroem, Secretary Ohio Pharmaceutical Association; Louis Werner, President Cincinnati Branch A. Ph. A., and numerous others both among pharmacists and physicians; in fact Cincinnati and Ohio generally are deeply interested and intensively active.

This organization shows what can be accomplished, that physicians and surgeons are interested, and coöperative action is possible and helpful. The importance of other states taking similar action is stressed. There must be a central body to prepare literature and direct, so that there may be concerted effort. It should be stated that good work is being done in Alabama, California, Texas, Missouri, Illinois, Iowa, Minnesota, New York, New Jersey, Kentucky, Georgia, Maryland, Pennsylvania, Maine, Kansas, etc.; in fact, there seems to be a general awakening

of an enthusiasm to stand up for right and justice and to win.

Letters sent to Congressmen should have the personal appeal; a short, personal letter to the point is better than a lengthy document. The brief which is supplied by the National Pharmaceutical Service Association contains the essential points for argument. The assistance of laymen, parents of the soldiers, will be helpful; they expect pharmaceutical service at home, and they will demand it for their sons when our efforts are explained to them. France recognized the value of a pharmaceutical corps, why should not the United States?

THE AMERICAN FAIRCHILD SCHOLARSHIP.

AWARDED TO DANIEL KOLLEN.

The first award of the American Fairchild Scholarship is made to Daniel Kollen of New York City. The American Fairchild scholar is of Russian birth, having been born in the city of Kishinef, State of Bessarabia, Russia, August 27, 1898. The father was a maker of wooden models for shoes; he died when Daniel was about eight years of age. The young man attended a Russian grammar school for about three and a half years and until April 1, 1910, when the family emigrated to the United States, arriving in New York City April 19.

DANIEL KOLLEN

Two weeks after arrival, Kollen entered Manhattan Public School No. 64, where June 29, 1913, the young man received his diploma. The spare hours and vacations were spent in the employ of his uncle at S. H. Ager's Pharmacy, 145 Avenue C, New York City, where he has ever since, up to the present, given his time between studies. September 9, 1913, Daniel entered DeWitt Clinton High School, New York City, from which he gradu-

ated June 30, 1917. His recommendations from the teachers and preceptor are excellent in every way. He matriculated at the Brooklyn College of Pharmacy and is a member of the Junior Class.

NEW YORK DRUG TRADE SECTION OF THE BOARD OF TRADE AND TRANSPORTATION.

The annual meeting of the Drug Trade Section of the New York Board of Trade and Transportation was held on January 8 at the Drug and Chemical Club. The following officers were chosen for the new year: *Chairman*, Howell Foster, of Schieffelin & Co.; *Vice-Chairman*, Turner F. Currens, of the Norwich Pharmacal Co.; *Treasurer*, William A. Hamann, of Roessler & Hasslacher Chemical Co.; *Secretary*, William F. McConnell; *To Represent Drug Trade Section as Director in New York Board of Trade and Transportation*, Burton T. Bush, of Antoine Chiris Co.; *Executive Committee*, Frederick E. Watermeyer, of Fritzsche Bros.; John T. Barry, of D. D. Williamson & Co.; Charles C. Bruen, of Bruen, Ritchey & Co.; Herbert D. Robbins, of McKesson & Robbins, Inc.; Frank C. Starr, of Sharp & Dohme.

Mr. Bush the retiring chairman made a report showing that the Section had patriotically cooperated with President Wilson.

THE PHILADELPHIA DRUG EXCHANGE.

The following officers were elected at the fifty-seventh annual meeting of the Philadelphia Drug Exchange: *President*, Harry B. French, of Smith, Kline & French Co.; *Vice-President*, Harry K. Mulford, of H. K. Mulford Company; *Secretary*, Joseph W. England; *Treasurer*, Anthony M. Hance; *Directors*, Charles E. Hires, of Charles E. Hires Co.; A. Robinson Melhvaine, of Melhvaine Bros.; Dr. Adolph W. Miller, of Aschenbach & Miller; Adam Pfromm, of Adam Pfromm & Co.; Blair Ferguson, of Ferguson Bros.; Clayton F. Shoemaker, of Shoemaker & Busch; Richard M. Shoemaker, of Robt. Shoemaker & Co.; and Walter V. Smith, of Valentine H. Smith & Co. Clayton F. Shoemaker presented the annual report in which he reviewed trade conditions in general and in greater detail those of the drug trade and the problems confronting the interests concerned. Relative to the establishment of a pharmaceutical corps in the U. S. Army he said in part:

"The men at the front are entitled to the

very best pharmaceutical service this country can give them and it should be fully as good as that afforded them in civil life. As a matter of public safety no one is permitted to dispense drugs in any State who is not properly and fully qualified and yet in our Army the pharmacist has absolutely no standing as such. A bill to remedy this has been introduced in the Congress by Hon. George W. Edmonds of this city, H. R. 5531. It is a most worthy measure and should be earnestly supported."

The annual dinner was given January 29 at the Bellevue-Stratford. The menu was of the usual excellence and the decorations artistic. President Harry B. French presided as toastmaster and his remarks and introductions of the speakers added zest to the occasion. Chairman Walter V. Smith provided an excellent program and received the congratulations of the guests.

The speakers of the evening were Emil P. Albrecht, President of the Philadelphia Bourse; Daniel Joseph McCarthy, M.D., Professor of Medical Jurisprudence, U. of Pa.; Congressman George W. Edmonds and Captain David Fallon, Oxford and Bucks Light Infantry, Australian and British Forces. The latter gave thrilling experiences of the war and gained the applause of the guests. Dr. McCarthy spoke of conditions in Russia, from where he had recently returned, having been engaged in a special mission. He presented views that enlightened the hearers on the present situation in that country and stressed the importance of the revolution in the future history of the world. Mr. Albrecht spoke of the history of the Bourse and the close and cooperative relation of the Drug Exchange. Congressman Edmonds spoke of the great need for a pharmaceutical corps and enlisted all drug interests to unite in a concerted effort to pass the bill which he had introduced in Congress.

SEVENTH ANNUAL MEETING OF THE AMERICAN DRUG MANUFACTURERS' ASSOCIATION.

The American Drug Manufacturers' Association convened in annual session January 28 at the Waldorf-Astoria, New York City. The first day was devoted to a meeting of several of the Sections, namely, the Committee on Standards and Deterioration, of which Dr. A. R. L. Dohme is chairman, investigating aconite, while Dr. Turner of Eli Lilly & Co. served as chairman of the committee in-

vestigating cannabis indica. The Biological Section also held sessions.

Practically all the national associations concerned with the drug interests were represented and their delegates received and accorded the privileges of the floor. Secretary W. J. Woodruff, in his report, spoke of the effect of the prohibition movement on the drug trade. He stated that bills in the legislatures of various states had placed serious and uncalled-for restrictions on the drug trade and that they were contributing largely to an increased cost of manufacturing.

President C. J. Lynn advocated centralization of supervision over industries and advised that the only policy should be to stand behind the Government in everything. He advocated an interest in the promotion of the sale of Thrift Stamps. He commended the coöperation of the Association with the various departments of the Government and asserted that drugs and medicines were being supplied with more regularity and less interference than other supplies. He praised the organizations of the medical departments of the Army and Navy.

Harry B. Mason read a paper by Frank G. Ryan, chairman of the Committee on Social Insurance, in which attention was called to the present socialistic tendencies. Henry C. Lovis reported on the work of the Committee on Industrial Preparedness, and the following committees also presented their reports: Dr. A. R. L. Dohme, as chairman of the Committee on Standards and Deterioration; Dr. Fred B. Kilmer, as chairman of the Tariff Committee; Charles J. Lynn, as chairman of the Executive Committee; and R. C. Stofer, as chairman of the Committee on Employment Problems.

Several minor changes in the Harrison narcotic law were recommended but it was the general belief of the delegates that the present law had proved a success. Resolutions were adopted by the convention favoring the repeal of the Sherman anti-trust law and pointing out that the Federal Trade Commission now fills the need for which the Sherman law was created, as in that way combinations which may be construed a violation of anti-trust laws could be prevented, whereas the Sherman law is usually not invoked until after such a combination has been formed. It was voted that any attempts of physicians to try to regulate pharmacy laws and of pharmacists to regulate medical laws should be discouraged as harmful and creating discord.

It was recommended that packages of drugs supplied the Government should be specially marked. It was brought out that many orders for drugs and medicines received for the Army and Navy are being held up because there is no standard for the basic drugs of these preparations. The Association will ask for the temporary use of substitutes which have been proved effective until a normal supply of the regular drugs can be obtained. The Association favored the payment of the federal war tax in installments at stated intervals instead of paying the tax in a lump sum.

It was decided to hold the convention next year in March, the exact date to be fixed by the Executive Committee. All the officers of the past year were reelected, and are as follows: *President*, Charles J. Lynn, of Indianapolis; *Vice-President*, R. C. Stofer, Norwich, N. Y.; *Secretary*, W. J. Woodruff, Detroit; *Treasurer*, Franklin Black, of New York City; *Executive Committee*, Dr. A. R. L. Dohme, of Baltimore, B. L. Murray, of New York, and Charles M. Woodruff, of Detroit.

The members assembled each day at luncheons and the meeting was closed with a banquet, January 30, at which President Charles J. Lynn presided as toastmaster, and speeches were made by Abram Elkus, the United States Ambassador to Turkey, Theodore E. Burton, former United States Senator, and the Rt. Rev. Charles S. Burch, Bishop Suffragan of the Diocese of New York.

IOWA COLLEGE OF PHARMACY.

Iowa College of Pharmacy has quite a list of alumni in the service of their country. Hon. J. M. Lindly is a member of Henry County Council of National Defense; W. R. Jennings and D. T. Stanton and W. A. Dodd are in France. R. G. Odle, R. E. Stewart, R. S. Potter, V. H. Tyler, M. F. Kyhl, C. W. Wilsey, J. P. Sweeney, S. M. Hadnott, and I. W. Fields are located at Camp Dodge, Des Moines. P. J. Hanzlik is with the National Medical Research Council. J. L. Kubicek is in the California Masonic Hospital Corps; W. E. Palmer, C. C. Powers, E. J. Meister and Fred Jean are in the Navy. H. W. Preuss, E. D. Brown, J. C. Liek, Charles Carter, R. E. Humphrey, E. L. Bright, I. V. Cozine, B. B. Hunter, P. K. Huston, V. M. Stephenson, W. R. Bryant, T. H. Gillespie, R. E. Barnes, H. J. Tierney, T. H. Beekman and E. T. Bjornstad are doing service or preparing for service in other localities.

COLLEGE OF PHARMACY, UNIVERSITY OF MICHIGAN

The Detroit Branch of the A. Ph. A. has accepted an invitation to join with the Prescott Club at Ann Arbor for their February meeting.

At the last meeting of the Prescott Club the following papers were much enjoyed:

"Patents," by Miss Irma Neuman.

"Vitamines," by J. A. Wyman.

"The Retail Drug Store," by H. B. McWilliams.

Professor Henry Kraemer attended the annual meetings of the Botanical Society of America at Pittsburgh, Pa., where he delivered a paper, "Some Experiments on the Modification of Color in Plants." Professor Kraemer was also honored by being made sub-editor of the Section of Pharmacognosy for the *Botanical Abstracts Journal* which is to be published by that Society.

PHILADELPHIA COLLEGE OF PHARMACY.

One of the stars on the service flag of the P. C. P. will be a gold star in honor of the memory of the late Kenneth Hay, of Dubois, Pennsylvania, a recent student of the Pharmacy course, who gave his life in the fight for freedom "Somewhere in France."

Over a hundred and fifty gift boxes were mailed to the students and recent graduates of the College who are fighting in either branch of service. Many boxes went to France and others to training camps all over the country. They were the gifts of the students attending college, the Faculty of the Institution and prominent alumni.

As the old year silently stole away and the new year was ushered in, there passed from the eyes of men in pharmacy, but not from their memories, the greatest figure in American pharmacy, the revered Dean of the College.

Reminiscent to Dean Remington is the story he often told of Ben. Ben is a colored man with a good heart and respectful manners, and he was much liked by the Dean. Said the Dean to him one day, "Ben, you've heard me lecture for years and you've been around this place long enough to be a druggist. Why don't you hang out your shingle?" After a moment's reflection, Ben answered,

"I'll hang the shingle out, Dean, but I'll have to word it 'All prescriptions filled at the owner's risk.'"

Professor Remington's entire scientific library has been bequeathed to Professor Charles H. LaWall and Professor E. Fullerton Cook, to be divided equally between them. For the present the library will be placed in the Pharmacy Department of the College as a reference library for the students in that department and will be catalogued as an adjunct library of the College.

George M. Beringer, Chairman of the Board of Trustees of the College, and Editor of the *American Journal of Pharmacy*, is confined to his home, having suffered a broken ankle, the result of a fall. He is improving as rapidly as can be expected.

MASSACHUSETTS COLLEGE OF PHARMACY.

The walls and roof of the new building are partially completed and the structure now shows the stately and impressive character of its exterior. All glass has been set in the windows, temporary doors are in place and the heating plant is installed and in operation while the interior is being finished. It is slow work to finish such an elaborate building as this at any time, but it is especially slow just now when materials and labor are so scarce and high, so that it will be several months before the interior will be finished and the equipment installed. The work has advanced far enough, however, to begin to show that the interior will in all ways equal the high character of the exterior. Mr. George Robert White, who is presenting the building to us, has kept in close touch with the architects as the work has progressed and the building already shows his unusually fine taste and judgment in architectural matters. Unless prevented by some circumstances not now foreseen, the College expects to occupy the new building before the opening of the next session.

Instructor George L. Burroughs has been granted a leave of absence for the period of the war for service in France with the Red Cross Society. Mr. Burroughs has the title of Inspector, which we understand is equivalent in rank to that of a captain in the army. Vincent J. Fitz-Simon, '17, has been appointed as a substitute for Mr. Burroughs.

CHANGES OF ADDRESS.

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of the change of address is received before shipment or mailing.

Both the old and the new address should be given thus:

HENRY MILTON,
From 2342 Albion Place, St. Louis, Mo.
To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or typewritten.

CHANGE OF ADDRESSES SINCE DEC. 18, 1917.

DILL, CHAS. T.,
From 167 W. 143rd St., New York, N. Y.

To 204 W. 141st St., New York, N. Y.

WITTKAMP, C. T.,
From Montgomery & Brewster Ave., Cincinnati, Ohio.

To 25 Erkenbrecher Ave., Cincinnati, Ohio.

HEUSCHLING, ALLEN J.,
From U. S. S. Dixie, cr. Postmaster, New York, N. Y.

To U. S. Embassy, London, Eng., cr. Navy Dept.

ALACÁN, SYLVIA,
From 4528 Chestnut St., Philadelphia, Pa.

To 17 No. 21, Vedado, Cuba.

HIGHT, M. S.,
From 32 Adams Ave., W., Detroit, Mich.
To 1038 8th Ave., Hickory, No. Car.

McCARTNEY, F. L.,
From 154 W. 18th St., New York, N. Y.
To 203 W. 81st St., New York, N. Y.

BASE, DANIEL,
From 329 N. Schroeder St., Baltimore, Md.

To 3905 Alto Ave., Windsor Hills, Baltimore, Md.

JURADO, BOLIVAR,
From National Institute, Panama City, Rep. of Panama.
To P. O. Box 80, David, Chiriquio, Rep. of Panama.

DUMÉZ, A. G.,
From 135 W. Gilman St., Madison, Wis.
To 25 & 3rd St., Hygienic Laboratory, Washington, D. C.

BROWN, ARTHUR F.,
From 219 N. Senate Ave., cr. Swan Myers Co., Indianapolis, Ind.
To 1445 N. 29th St., Philadelphia, Pa.

DEAN, J. A.,
From 1809 Wallace St., Philadelphia, Pa.
To 5420 Baltimore Ave., Philadelphia, Pa.

RITTER, WALTER A.,
From 629 Peosta Ave., Helena, Mont.
To 273 17th St., Milwaukee, Wis.

DECEASED SINCE DEC. 18, 1917.

FISCHNAR, J. F.
Chicago, Ill.

HOLZHAUER, CHARLES,
Newark, N. J.

McFADDEN, E. A.,
Hackensack, N. J.

REMINGTON, J. P.,
Philadelphia, Pa.

WELDON, GEO.,
Paris, Idaho.

A WORD FROM THE TREASURER.

The A. Ph. A. fiscal year runs even with the calendar year. The annual payment for 1918 was due January 1. The bills were mailed to the members December 17, 1917. It is gratifying to state that at the present writing, January 5, the treasurer has received 725 payments for 1918. A prompt response from the other members will save the association the expense of mailing a second bill.

New Year's greetings to all from

HENRY M. WHELPLEY,
2342 Albion Place, St. Louis, Mo.

BOOK NOTICES AND REVIEWS.

HOW MUCH KNOWLEDGE OF DRUGS AS MEDICINES SHOULD THE PHARMACIST POSSESS TO PRACTICE PHARMACY PROPERLY?

There is considerable difference of opinion in relation to the question, how much knowledge of drugs as medicines the pharmacist should possess to practice pharmacy properly. One side takes the ground that no person is thoroughly competent to practice any medical or surgical art without a medical education, and the other side insists that a specialized training in any one art is all that is necessary to render the practitioner expert.

Those who hold the latter view in regard to pharmacy believe that the interests of the public are best served by pharmacists who know practically nothing about the action of drugs as therapeutic agents, and whose knowledge is limited to the mere fact that certain drugs are cathartics, others diuretics, etc., and who are acquainted with the average doses prescribed for adults and children.

Those who hold to the doctrine that a more general medical education and knowledge concerning the action of drugs on healthy and diseased tissues are necessary to practice pharmacy properly, call attention to the fact that "in the medical schools, over 200 hours are devoted to teaching students knowledge of the medical actions, uses and doses of drugs; and of the symptoms and treatment of poisoning. And, furthermore, the medical student, in order that he may understand these subjects thoroughly, must have pursued studies in anatomy, physiology and pathology for nearly two years; and before being able to apply the knowledge, the student is required to spend another two years or more in the study of disease." This long study, they point out, "is considered by all those capable of judging as absolutely essential to the safety of the public; therefore the pharmacist who, without this knowledge, undertakes to treat the sick by prescribing or recommending medicines over the counter, assumes grave moral responsibilities, and, sooner or later, may have occasion to face serious legal complications."

There are others who hold that pharmacy is a trade or commercial business, and in conducting it the pharmacist and manufacturer

should be guided by the same commercial uses pertaining to merchants and manufacturers in other lines. They believe in using advertising to create a demand for medicines and justify themselves in publishing exaggerated claims for therapeutic value by saying, "A certain amount of exaggeration in advertising is considered legitimate in all trades."

Into the midst of this conflict of opinions Dr. Torald Sollmann has injected a treatise on "The Actions of Drugs"¹ consisting of a course of elementary lectures for students of of pharmacy.

Dr. Sollmann is professor of pharmacology and materia medica in the School of Medicine of Western Reserve University, Cleveland, and a member of the Council on Pharmacy and Chemistry of the American Medical Association. The author states in his preface that his course of lectures was planned "with the intention of giving to the young pharmacist a concise survey of the modern conceptions and knowledge of drug action. It was aimed to make this course "sound," but elementary; demanding but little previous knowledge of physiology or anatomy; and not pretending to fit the pharmacist for the treatment of disease. In his introductory chapter he says: "It would be out of the question to give to students of pharmacy a course that would enable them to treat any kind of sickness. Indeed, it would be far better for the public, and even for the pharmacist himself, that the pharmacist should be entirely ignorant of medical actions, than that he should become possessed of the dangerous conceit that he is competent to advise or prescribe any treatment."

It is evident that the prescribing druggist and commercial merchant and manufacturer of medicines will find but little comfort in this statement of the object of Dr. Sollmann's book, though both may find much of interest in its pages; but the professional pharmacist, and the "tradesman" in pharmacy who really strives to give the public a square deal, will find the book of great practical value. The author states this in well-chosen language. He says:

"Nevertheless, to the sensible and tactful pharmacist, some knowledge of these matters is very useful, and indeed necessary. As a

¹ "The Action of Drugs: A Course of Elementary Lectures for Students of Pharmacy" By Torald Sollmann, M.D., Professor of Pharmacology and Materia Medica in the School of Medicine of Western Reserve University, Cleveland. Philadelphia and London, W. B. Saunders Company, 1917. 213 pages. Price, \$1.50.

tradesman, the public expects the pharmacist to be familiar with the uses to which his wares are commonly put, and with the manner of their use. As a professional man, he can coöperate with the prescribing physician much better, if he has an intelligent understanding of the broad principles which guide treatment, of the objects which are to be accomplished and of the means that are utilized. The pharmacist himself will be protected against many blunders in the exercise of his higher professional function, the compounding of prescriptions. He will be able to protect the public against the errors of others, as well as his own. He may, by the exercise of some tact, put the physician under lasting obligations. In cases of poisoning, he has often the opportunity to institute preliminary treatment which may decide the patient's life."

We predict a large sale for Dr. Sollmann's little treatise. The material is well classified and arranged; the text is written in a style both interesting and concise; the type is large and legible; the reading matter is frequently broken into short paragraphs with suggestive side heads, and the information is useful without burdening the reader with unnecessary data.

F. E. STEWART.

Elementary Lessons in Latin.—By Otto A. Wall, M.D., Ph.G., Professor of Materia Medica, Pharmacognosy and Botany in the St. Louis College of Pharmacy, second edition, 148 pages, cloth, \$1.50 net. St. Louis, C. V. Mosby Company, 1917.

The object of this book, according to the author, is to "enable the student to read the Latin edition of the German Pharmacopoeia," which he says is "as much Latin as is necessary for the pharmaceutical or medical student." The book is based upon Professor Kuehner's "*Lateinische Vorschule*" and shows throughout the German influence. The continental method of pronunciation is used.

The book is divided into two parts: Part I, consisting of eighty pages, is devoted to grammar, and Part II, containing sixty-eight pages, to vocabulary and reading matter. Grammar, by itself, is dry reading and it would seem that for a beginner it would be preferable to introduce the grammar gradually with the reading matter. The grammar might well be reduced also if the desire is to give only minimum amount of Latin necessary. The main object in using a pharmaceutical Latin text, I take it, is to give the student a technical vocabulary. This part seems compre-

hensive and very technical, the reading exercises suffer in consequence, necessarily, perhaps, in interest and continuity. For a beginner the book would be easier to use if a complete alphabetical vocabulary had been provided. For a book of its purpose, it might well be shorter and for a book of its length it might better be less technical. The type and paper used are good, the subject matter is easily read, a matter of importance in a text.

E. D.

The Practice of Pharmacy—A Treatise on the Modes of Making and Dispensing Official, Unofficial, and Extemporaneous Preparations, with Descriptions of Medicinal Substances, Their Properties, Uses, and Doses, Intended as a Hand-Book for Pharmacists and Physicians and a Text-Book for Students. By Joseph P. Remington, Ph.M., Phar.D., F. C. S., Chairman of the Committee of Revision of the United States Pharmacopoeial Convention; Dean of the Philadelphia College of Pharmacy, etc., Assisted by E. Fullerton Cook, P.D., Associate Professor of Operative Pharmacy in the Philadelphia College of Pharmacy; Member of the Committee of Revision of the National Formulary. Buckram; 6 by 9 inches; pages 1990; \$8.00. Philadelphia: J. B. Lippincott Company, 1917.

Remington's "Practice of Pharmacy" has been the reference and text-book of American pharmacists for more than thirty years and the despair as well as the hope of thousands of students of pharmacy. This, the sixth edition, is a worthy successor of its predecessors and it is safe to say that it will maintain the position that this work has held as the dean of pharmaceutical text-books and one of the most valuable contributions to pharmaceutical literature.

This edition has been enlarged by about four hundred pages making in the single book a volume of over nineteen hundred pages. For convenience the present edition may be secured in two volumes. This review, covering Vol. II, is chiefly one of comparisons, to point out a few of the many excellent features added to and the improvements made in the text of this honored and worthy work. (See also p. 766, August 1917.)

The general plan of the book is the same as in previous editions. Part III treats of the Inorganic Substances; Part IV of Organic Substances, beginning with the Cellulose Group, the Alkaloids, and Products from Animal Substances with a final chapter on

Pharmaceutical Testing; Part V, Magistral Pharmacy; and Part VI a Formulary of Unofficial Preparations and Glossary of Uncommon Names.

The drugs and preparations of the National Formulary IV have been incorporated in the text following the pharmacopoeial preparations of like classification and are discussed in the same manner as the U. S. P. subjects. This places at the disposal of the pharmacist the working formulas of both U. S. P. and N. F. in one book and adds greatly to the value of the work.

A review of Volume II shows thorough and careful revision of text as well as the addition of much new material. The introductions to several chapters have been rewritten. In Chapter LI on Sugars and Saccharine Substances a classification of sugars is given, based on that of Tollens. The Alcoholometric Table and Temperature Corrections of the U. S. P. replace Abridged Squibb Table in Chapter LII. Chapter LV on Volatile Oils classifies the volatile oils according to Wallach and their constituents into seven chemical groups. The alkaloids in Chapter LX are classified according to their chemical derivation. Bacterial Vaccines and Bacterins are briefly outlined in Chapter LXI following the article on *Virus Vaccinicum*. This consists of a number of definitions of common terms coming under this heading such as antibodies, opsonins, serobacterins, etc., together with a list of the most important stock vaccines. To Chapter LXIV on Prescriptions has been added the N. A. R. D. Prescription Pricing Schedule. Incompatibilities in Prescriptions, Chapter LXVI, has been improved by the addition of a large list of Incompatibilities of the More Important Newer Remedies. Incompatibilities of aspirin, adrenalin, ichthyol, theobromine, sodio-salicylate, veronal, etc., are explained and will serve as a valuable guide to the dispenser. Chapter LXVII, Solid Extemporaneous Preparations, has been enlarged and new illustrations added. The portion devoted to tablet manufacture has been largely rewritten and the process more fully discussed. Paragraphs describing granulation, diluents, disintegrators, excipients, lubricants and constructing a formula give to the reader a more comprehensive knowledge of this important branch of pharmaceutical manufacturing. A new chapter, LXIX, deals

with sterilization and ampuls. The uses of sterilization as applied by pharmacists are enumerated together with brief discussions of common methods whereby sterilization may be accomplished. Ampuls as a means of dispensing sterile solutions and suspensions and methods for filling are described. The student is urged, however, to secure laboratory training in general, bacteriological methods before undertaking work along this line. Part VI, Formulary of Unofficial Preparations, includes a number of new formulas, Paraffin Dressing for Burns, Carrel-Dakin Solution and others.

The charts of U. S. P. and N. F. substances following the various parts have been given the same careful attention in revision as the text. The lists of Unofficial Products that follow the several chapters have had a number of deletions and many additions. Unofficial Products from Coal Tar show addition of such important items as novocaine, novaspirin, salvarsan, etc.

This work offers only such criticisms as are debatable. As a contribution of pharmacy its value has been greatly enhanced by additions and corrections that broaden the scope of the work to such an extent that the intention of the author to make this a comprehensive hand-book as well as a text-book are more fully realized.

C. A. DUNCAN.

PUBLICATIONS RECEIVED.

Proceedings of the Pennsylvania Pharmaceutical Association.—At its fortieth annual meeting, with the constitution, by-laws, roll of members, and new State pharmacy and narcotic laws. Also an abstract of the proceedings and roll of members of the Traveling Men's Auxiliary. Held at Hotel Schenley, Pittsburgh, Pa., June 10, 20, 21, 1917.

Proceedings of the New Jersey Pharmaceutical Association.—At its forty-seventh annual meeting. With constitution and by-laws, roll of members, the pharmacy act of New Jersey, list of registered pharmacists, the Traveling Men's Auxiliary and the Women's Auxiliary. Held at Lake Hopatcong, New Jersey, June 12, 13, 14 and 15, 1917.

Proceedings of the California Pharmaceutical Association.—At its eleventh annual meeting. Held at Hotel Oakland, Oakland, Cal., May 23, 24 and 25, 1917.

HAVANA, CUBA

Translator, and Editor of the Spanish edition of the United States Pharmacopoeia

DR. JOSE G. DIAZ

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL. VII

MARCH, 1918

NO. 3

JOSÉ GUILLERMO DIAZ.

Dr. José Guillermo Diaz was born in Havana, Cuba, December 12, 1863. His early education was received in the high school course of the *Instituto de la Habana*, from which he graduated in 1879. In the same year he matriculated at the School of Pharmacy of the University of Havana, and graduated in 1883; in 1887 he received the Doctor's degree from the same institution.

In 1889 he was appointed assistant professor in the School of Pharmacy and continued to hold this position until 1896, when, on account of the war with Spain, he removed to New York City to help in the cause of independence. After the war Prof. Diaz returned to Havana and was again appointed assistant professor. In 1900 he was elected professor of Practical Pharmacy, which chair he still holds.

Dr. Diaz is the owner of a retail drug store in Havana. This store was established by his father, Dr. José Diaz, in 1842, in the same building now occupied by his son, at Monte 412.

In 1910 Dr. Diaz was present as member of the U. S. Pharmacopoeial Convention, representing the University of Havana. He translated the U. S. P. VIII into Spanish and also the last revision. In 1915 Dr. Diaz was elected a member of the Academy of Medical Sciences of Havana. He has attended several of the annual conventions of the American Pharmaceutical Association.

J. P. A.

PHARMACISTS SHOULD HOLD POSITIONS IN SEVERAL GOVERNMENT DEPARTMENTS.

PHARMACISTS throughout the country, assisted to some extent by medical men, are making a strong effort to have pharmacy recognized by the Government in the creation of a pharmaceutical corps in the U. S. Army. By granting such recognition the United States will not be establishing a precedent nor take the lead among nations in such establishment, for France many years ago provided a pharmaceutical corps as a branch of its military organization and, since the world conflict, has added greatly to its duties and numerical strength, emphasizing the words of the senator from Rhone when he said "that the members of the French Pharmaceutical Corps have in their humble sphere contributed most eminent service to save the country." If then France has found that the services of pharmacists are essential to the men of their armies, the experience should be accepted as of value to our soldiers.

There is no reason why medical men in the Army should be deprived of qualified pharmaceutical service when this is deemed essential in civil practice, nor is there reason why efficient pharmaceutical service, which is provided to the men in civil life, under legal regulations, should be withdrawn from them when they enter upon duties which will most certainly call for medical and surgical attention. If the measures now before Congress are defective in any way or seriously conflict with the present military organization, then the subject should be investigated and the inclusion of a pharmaceutical corps made possible. The time for action is now. What French pharmacists have done can be done by American pharmacists, for the high position of American pharmacy has been and is recognized in Europe. The *Pharmaceutical Journal* (England) of February 9, 1918, says in an editorial:

"The United States has been uncommonly fortunate in the possession of a remarkable array of eminent pharmacists who have rendered signal service to the science of pharmacy and to the cause of pharmaceutical education and progress."

But this is incidental at this time for this writing, as there is no desire to interpose a new subject while the more important one for the present is still in the shaping. However, if the Government once gives recognition to pharmacy and realizes the possibilities of its service, then the further necessity will be recognized, that there are departments in which the services of pharmacists will be helpful not only to the Government but to industries which contribute to the country's prosperity and which the Government desires to coöperate with. Recently, in preparing the war tax measure, and more specifically that portion which concerns the tax on alcohol, it became very evident that the framers of these regulations

were unacquainted with retail and manufacturing pharmacy, and resulted in unintentional exactions that could have been avoided if a pharmacist was attached to the Revenue Department. It also stands to reason that in the Bureau of Chemistry more trained pharmacists should be employed. It need not be emphasized that the Government not only desires to be fair and shape the regulations in such a way that they will protect the public but is also equally desirous of having them practicable and adaptable to the industries concerned. The sincerity of pharmacists is clearly evidenced in the preparation of standards in the United States Pharmacopoeia and National Formulary; but aside from substances coming within the scope of these standards there are products which differ and still there is commercial need for them. Herein trained pharmacists can be of great service, and therefore the resolutions offered recently by Dr. J. H. Beal and printed on p. 217 of the February JOURNAL, will bear reproduction. The matter is deserving of attention, not only by pharmaceutical organizations, but by the Government as well; for President Wilson has repeatedly referred to the importance of Government coöperation with the industries and reversely. The resolution follows:

"WHEREAS, It does not appear that at the present time there are experienced and practically trained representatives of the drug manufacturing and selling industries connected with the U. S. Bureau of Chemistry or with the U. S. Bureau of Internal Revenue, both of which bureaus are charged with the interpretation and administration of laws applying to the manufacturing and selling of drugs and medicinal products; and

"WHEREAS, The just and equitable interpretation and application of such laws frequently involves the consideration of technical questions which can be properly answered only by those who have had technical training and practical experience in the manufacturing and selling of drugs and medicinal products; therefore be it

"*Resolved*, That we recommend that the various associations and societies representing the several divisions of the drug trade bring the above statements of facts to the attention of the proper authorities at Washington and urge upon them the appointment in the Bureau of Chemistry and in the Bureau of Internal Revenue of one or more representatives familiar by practical experience with the manufacturing and handling of drugs and medicinal products and of the material used therein."

Another instance that might be cited showing that the departments of the Government need the advice of pharmacists is indicated in *Document 564* of the War Department, from the office of the Quartermaster General. The *Manual* contains definitions, which, on the whole, are sufficiently clear and comprehensive, but such statements as the following also occur and could readily have been correctly given if there had been consultation and coöperation.

"*Aniline*. Dye used in highly colored confectionery. A product of petroleum. The red shades are harmless, but the chemicals used in making blue, green and other colors are injurious."

"Ferment. A substance capable of producing yeast fermentation."

"Glucose. A cheap sugar that will not easily crystallize or a cheap syrup that will not crystallize, very much like 'Silver Drip,' but much thicker. Glucose is often made by treating cornmeal with sulphuric acid. It is very wholesome."

E. G. E.

THE SIGNIFICANCE OF MILITARY RANK.

THE following epigram is on the letter head of the New York State Department of Health: "Public health is purchasable. Within natural limitations every community can determine its own death rate." The statement is both true and of great significance and speaks much for the progress of medicine, and pharmacists are glad to accord to the practitioners of medicine and surgery every credit that is justly due them, in fact the achievements of medicine and of surgery have perhaps not generally received due consideration. Every now and then some one attempts to express the value of "preventive" medicine in dollars. The present war is again testifying to the wonderful progress medicine and surgery have made, to the real heroism and genuine patriotism of surgeons and physicians. There are no dangers they do not risk, without concern for their own health and comfort. The conferring of military rank to medical men in the Army and Navy service is a just and rightful recognition, and places them in position to do the most efficient work. Not that they could not and would not do equally as good work without such rank, but the opportunities are enhanced by this recognition, the very distinction given them commands the respect and obedience of those whom they serve. In large, and especially military, organizations, rank is essential to efficiency; it establishes a relationship that would not exist without the distinction, and stimulates a desire to advance.

In giving all due credit to the medical men for their achievements, for making valuable suggestions, for their sacrifices in behalf of science and humanity, the fact cannot be ignored that pharmacists have had a part in these accomplishments. It is true, perhaps, that medical men have devised some of the means used in their practice, but, as a rule, they were too busily engaged in their special field of activity to give attention to the preparation of agents they realized the need of. Lister was always ready to give Pasteur credit for his investigations, and Sertürner, Labarraque, Pelletier, Caventon, Gaedeke and the host of others who studied and developed the active constituents of drugs are certainly entitled to recognition as contributors to medical advance, and when modern serum therapy and physiological standardization are considered, American pharmacists, many of them humble retail pharmacists, have contributed their share in investigations and accomplishments. The spirit of the modern world looks toward the application of every scrap of knowledge that can be collected and coördinated, in every

field where opportunity for its application can by any possibility be found. It is not to be expected that military surgeons and physicians should accord pharmacists the consideration they would if a degree of rank was given them. Assign to the most noted scientist the duty of scrubbing floors and other menial labor, and it is only in case of utmost emergency that his views or assistance will be asked in the matter of scientific subjects with which he is thoroughly informed.

England recently has given rank to some pharmacists engaged in France, and a report of a *medical officer* who also refers to the colonial and foreign pharmaceutical corps, in brief, demonstrates the value of commissions to pharmacists. He states:

"The first point that struck me as noteworthy was the complete confidence reposed by the commanding officer and medical officers in the pharmacist and his work; secondly, the frequent consultations as to the preparations to be utilized in the treatment of cases; thirdly, the general elevation of the importance of the pharmaceutical branch of the service; fourthly, the insistence of colonial officers on the imperative necessity for nothing but fully qualified pharmacists being responsible for the dispensaries; and, fifthly, the consternation with which they regard the antiquated pharmaceutical arrangements of the British medical service as compared with the modern and efficient organization of the colonial and foreign arms of this corps. With reference to the first point, it is a fact that in 99 percent of cases an officer has more of the confidence of his commissioned officers and fellow officers than a non-commissioned officer, and in the case of prescribing, as in the second instance, it follows that ultimately more benefit will accrue to the patient. The idea is frequently harbored that because the dispenser is not commissioned his statements are not fully reliable. This is obviously a fallacy; but, at the same time, it must be admitted that commissioned rank increases the standing of a person. Again, with reference to the second point, it is fairly evident that medical officers consider it somewhat beneath their dignity to ask for information on a subject in which they are supposed to be proficient, especially as the information would be given by a non-commissioned officer. The sum and substance of the whole is that where treatment is specialized (*i. e.*, from the casualty clearing station down), the presence of a pharmacist who could be consulted with confidence, would be of a distinct advantage to the patient; and that to insure confidence and coöperation, the granting of commissions to experienced pharmacists is essential."

These very clear and modest statements certainly should appeal to those medical men who are fearful that pharmacists will be given a rank and thereby injure their standing in some unaccountable way. It would be desirable for them to know that those who serve them are qualified to do so intelligently and not to be in doubt as to whether the dispenser has had training or simply has been assigned to dispensing duty because he can read the number on a container, and has no knowledge of drugs whatever. Such a condition is impossible in civil life, why should it obtain in the Army? It stands to reason that there are qualified pharmacists, many are enlisted as privates; it is as reprehensible to waste talent as material things. There is something wrong somewhere; let the situation be cleared up. Within limitations, the U. S. Army can determine its own death rate and pharmaceutical service will have a part. Pharmacy can be ignored, but not without sacrifice of men.

E. G. E.

THE NEED FOR A FEDERATION OF ALL PHARMACEUTICAL ORGANIZATIONS.*

NEVER in the history of American pharmacy has there been greater urgency for a federation of pharmaceutical organizations than at present. Leaders in pharmacy have recognized the need ever since the inception of the American Pharmaceutical Association, but evidently the movement has never been sufficiently energized to bring about the culmination.

The military organization presents in a way distinct and separate branches, but all of them are coördinated so as to utilize the various activities represented for a common purpose. To permit these corps to act independently throughout would thwart their efforts. And so the multiplication of organizations of an industry, unless joined in common purposes, does not permit of the grand efforts, those in which all should be concerned. Let it be admitted that all the national pharmaceutical associations serve those branches which they directly represent, that each of them is essential for carrying out special aims and that these have no interest for the other divisions of the drug industries; it still remains that these sections are related, all are finally dependent upon the distributors; the reverse, of course, applies as well. For example, there has been much said about doing away with the middlemen, but their place has been so firmly fixed that up to the present they are as important a branch as ever and will so continue because their services are necessary. The point then is to unite these links into a strong chain for the purposes in which the aid of all is essential. If this can be properly worked out it will develop that there are many problems, in common, which can be solved and movements that can be carried into more effective execution. Wise executive measures may also reduce the large overhead expense which encumbers most of these organizations. It stands to reason that, if the coöperation of many and their numerical strength can bring about a better recognition of pharmacy, then every division will benefit.

To prevent the coalition of forces, persuading them to remain inactive or work at cross-points, gives strength to the adversary. The reverse then is true that, if there can be unison of action, if the separate branches can be counted on for their support and numerical strength in important projects, there is greater possibility for achieving in them. It would seem to be equally true that if all these separate bodies can be brought into a federation each will benefit in many ways. It is of paramount importance that the local and state associations become attached, for the common interest of an association should represent the interest of the in-

* See address of Ex-President Frederick J. Wulling, September JOURNAL, 1917, p. 778, October number, p. 854, and message of Acting President A. R. L. Dohme, p. 117, February issue, 1918.

dividual member. Each one of the societies referred to seeks to impress the individual that his efforts are enhanced by association work, and if the argument will hold then certainly it is equally applicable, and in a larger degree, that the federation of closely related associations must be productive of increased relative benefits. Such organization will offer greater opportunities for coöperation of the allied interests, for shaping and regulating the drug business in general on a more satisfactory and profitable basis, for making possible more rational legislation, and coördinating the system of teaching with the present-day needs and at the same time developing what is so essential for the progress of pharmacy, namely, research. We need a materia medica that will be broad enough to meet the views of all practitioners of medicine, and that will draw more extensively from our own resources and products of our industries.

Pharmacy is entitled to representation in the departments of the Government, deserves recognition in the military service, but without concerted action and with indifferent support of the medical profession and the laity, the paths that lead to success are not smooth.

The minds of many should be occupied with this question of federating the body-pharmaceutic, and that there must be a way of impressing the importance of pharmacy, that divisionalism has not done so, and that federation may be the solution of the vexing problem. In this proposition the situation of the drug business should be faced, and not the impossible attempted; it is a problem of co-ordination and coöperation; we must realize that the development of the drug industries has been influenced by economic conditions, and these cannot be changed at will, but there is a possibility of having the branches unite in common purposes and systematize these endeavors for the good of all associated organizations.

"To know that which before us lies in daily life is the prime of wisdom."

A committee has recently been appointed to study the possibility and practicability of a federation and outline a plan of procedure and the members of it are now seriously engaged with their assigned duties. This writing is therefore in the interest of the problem to the extent of encouraging all members of the Association to study the subject. The greatest fault of associations is to give approval to many recommendations, resolve and thereafter forget. The proceedings of our Association record many wise suggestions that were enthusiastically received by the members but were never utilized by them. Resolutions should have a deeper significance.

SCIENTIFIC SECTION

THE DETERIORATION OF "U. S. P." AND "FAT-FREE" TINCTURES OF DIGITALIS.*

BY PAUL S. PITTENGER AND H. K. MULFORD, JR.

Many papers have been published on the subject of digitalis, in which practically all of the authors conclude that the galenical preparations of digitalis deteriorate quite rapidly.

The laboratories connected with the larger pharmaceutical manufacturing houses, although using many different methods of assay, all found that these preparations deteriorated so rapidly that they deemed it necessary to warn their customers of this fact by placing small labels upon the containers reading as follows:

"Owing to the rapid deterioration of preparations of digitalis, they should only be purchased in quantities sufficient to meet immediate demands."

The more ethical manufacturers also state upon the label the date of manufacture in order that the druggist or physician may know the age of the particular preparation he is dispensing or administering.

Dr. George B. Roth, Government Pharmacologist, states in the conclusion of his paper entitled "Digitalis Standardization"[†] "in view of the fact that deterioration of digitalis occurs so rapidly it is advisable that, if such preparations are to be marketed, the date of their manufacture should be stated, so that physicians may know the age of the preparations and may not be misguided into purchasing worthless preparations."

Hatcher,¹ however, in an article entitled "Observations on the Keeping Properties of Digitalis and Some of Its Preparations" gives the results of many tests made upon old samples of the drug, and arrived at the conclusion that preparations of digitalis do not deteriorate. He found that in many cases samples from two to twenty years old were as active, and in some cases more active, than the freshly prepared samples and therefore concluded that digitalis preparations do not deteriorate.

As the investigations of Fränkel,² Edmonds and Hale,³ Hale,⁴ Pittenger,⁵ and others show that the digitalis preparations upon the market vary hundreds of percent, there is every reason to believe that the preparations which showed standard activity after several years may have originally been six or eight times standard strength.

It is the authors opinion that the only way in which any definite information can be obtained as to the rate of deterioration of a particular drug is to prepare

a fresh tincture or fluid extract of the same, test it immediately after it is prepared and then retest the *same preparation* at intervals of a few months. In this way absolute scientific information can be obtained.

Roth, in the paper referred to, shows that "fat-free" tinctures of digitalis show a marked deterioration after five to seven months. At several of the medical societies, which the authors have attended during the past year, the remark has been made during the discussion of papers that the so-called "fat-free" or "defatted" tinctures of digitalis deteriorate more rapidly than the U. S. P. tinctures. These remarks, however, were made without the support of experimental data. In order to prove, therefore, whether or not tinctures of digitalis deteriorate, and if so, whether the "fat-free" preparations deteriorate more or less rapidly than the regular U. S. P. tinctures, we carried out the following experiments:

A sample of digitalis drug was obtained from different sources, namely, H. K. Mulford Co., P. E. Anderson, Werner & Gerathy, McKesson & Robbins and the National Aniline & Chemical Company. Each lot of drug was divided into three parts, "A," "B," and "C."

"A" was percolated with fifty percent alcohol and made into the regular U. S. P. VIII tincture.

"B" was percolated with benzine until a small quantity of the percolate evaporated to dryness on a watch crystal left no trace of fat, thus proving that the fat had been entirely removed from the drug. The drug was then spread out on paper until the benzine evaporated. The drug was then moistened, repacked in the percolator, macerated, and percolated with fifty percent alcohol to tincture strength.

"C" was "defatted" the same as given under "B," but was macerated and percolated with eighty percent alcohol instead of fifty percent alcohol.

Each of the fifteen samples were assayed immediately after they were prepared, re-assayed after four or five months had elapsed and again after seven or eight months.

As there is no satisfactory chemical method for assaying digitalis, the above preparations were tested by the Reed and Vanderkleed Guinea-Pig Method, which consists in determining the minimum dose per two hundred and fifty gramme body-weight of animal necessary to cause the death of the animal within twenty-four hours, when the preparation is subcutaneously injected. The standard for tincture of digitalis is 1.0 mil (Cc.) per two hundred and fifty gramme body-weight of animal.

The following tables show the detailed results of these experiments:

| No. 5 B. Same drug as No. 5 A. "Defatted" U. S. P. VIII, 50% menstruum | 7-13-16 45.4% | 11-29-16 27.0% | 2-1-17 27.0% | 7-13-16 to 2-1-17 18.4% |

SUMMARY OF RESULTS—Continued.

| Sample. | 1st assay. | 2nd assay. | 3rd assay. | Total deterioration. |
|-----------------------------------------------------------------------------------|------------------|-----------------|-----------------|----------------------------|
| No. 5 C. Same drug as No. 5 A and No. 5 B. "Defatted" 50% alcohol menstruum | 7-13-16 66.6% | 11-29-16 50% | 2-1-17 45.4% | 7-13-16 to 2-1-17 21.2% |

It will be noted from the above results that every sample except one, *i. e.*, No. 3 B, showed marked deterioration, some samples deteriorating as much as 75 percent in seven months. These results will, therefore, tend to prove that in most cases tincture of digitalis not only deteriorates but deteriorates very rapidly.

The results also show that the "fat-free" or "defatted" tinctures of digitalis *do not* deteriorate more rapidly than the regular U. S. P. VIII tincture, as the ten "defatted" tinctures only show an average deterioration of 32 percent for the seven months' period of test, whereas the five U. S. P. VIII tinctures show a deterioration of 44.6 percent for the same period of time.

From the results of these experiments we can, therefore, draw the following conclusions:

- (1) Most tinctures of digitalis deteriorate very rapidly.
- (2) "Fat-free" or "defatted" tinctures of digitalis do not deteriorate at a greater rate than the U. S. P. VIII tinctures.

PHARMACODYNAMIC LABORATORY,

August 24, 1917.

AN IMPROVED LIME METHOD FOR ASSAYING OPIUM.*

BY WM. MASKE, JR.

This assay method has been the outcome of several which the writer has read and experimented with but the foundation of the assay outlined herein is a somewhat crude process by A. Guerin as given in the *Jahresberichte der Pharmazie*, Vol. 48, Page 45. As this writer collects 52 Cc. filtrate instead of the 50 Cc. as advised in this paper, and the first quantity can not readily be measured accurately, one can just as well collect 50 Cc., an amount which can be accurately measured in a volumetric flask or sucked up in a volumetric pipette, and add the correction factor, which amounts to the same thing as collecting 52 Cc. of filtrate.

The lime method of assaying opium for its morphine content is probably used more than any other method of assaying this drug. The U. S. P. uses a lime process which gives good results in the hands of experienced workers, but which for a beginner is apt to prove cumbersome. Moreover, the method takes more time and work than is necessary. The writer has successfully used the following modification of the lime method, which is simpler, less cumbersome than the U. S. P. method, and gives just as accurate results:

Method: Weigh out 7.5 Gm. of opium and dry at 60° C. Transfer the dried opium to a mortar containing 5 Gm. of fine, clean quartz sand and 3 Gm. of slaked lime. Triturate the three ingredients thoroughly until a finely divided homo-

* Read before Scientific Section A. Ph. A., Indianapolis meeting, 1917.

geneous mixture of opium is obtained. Brush the contents of the mortar on a piece of glazed paper and from there into a glass-stoppered Erlenmeyer flask of about 150 Cc. capacity. Add 75 Cc. of distilled water and shake vigorously for fifteen minutes, and then every ten minutes during three hours (or continuously in a mechanical shaker). Filter off 50 Cc. of the solution into a 50 Cc. volumetric flask. This represents approximately 5 Gm. of opium.

Transfer the whole of the filtrate to a separator, washing the flask with a small portion of distilled water. Add 15 Cc. of ether and shake thoroughly. Now add 1 Gm. of ammonium chloride and shake frequently for half an hour; then set it aside in a cool place overnight. Plug the stem of the separator fairly tight with a pledget of purified cotton and allow the liquid to drain off. Wash the funnel and its contents with morphinated water until the drippings are colorless, then wash with two small portions of distilled water to replace the morphinated water. Dislodge the cotton plug in the separator stem by blowing vigorously into the top of the separatory funnel and catch it in a clean Erlenmeyer flask.

Close the stop-cock and add 25 Cc. of tenth-normal sulphuric acid, V. S., replace the stopper and agitate until the crystals in the separator are dissolved. Then dissolve the crystals in the stem of the separator by holding the funnel at an angle, allowing the acid to run out slowly into the Erlenmeyer flask and at the same time rotating the separator. Wash the separator with three 10 Cc. portions of distilled water; also wash the stem of the separator, adding all of these washings to the contents of the Erlenmeyer flask. Agitate the flask until any remaining crystals are dissolved and titrate the excess of acid with fiftieth-normal potassium hydroxide, V. S. Make a correction by adding to the actual number of Cc. of acid consumed one twenty-fifth of this amount. Each mil of tenth-normal sulphuric acid, V. S., consumed corresponds to 0.028516 Gm. of anhydrous morphine.

UNIVERSITY OF WASHINGTON,
COLLEGE OF PHARMACY.

TOLU AND SUGAR COATING IN THE DISGUIISING OF MEDICINES.

BY BERNARD FANTUS, M.D.

The disguising of disagreeable medicines is, in general, a problem of sneaking the agent past the guardianship of the palate, without changing the substance to such an extent as to impair its medicinal activity. One means of doing this is by some coating insoluble in the saliva but soluble in some of the other digestive juices. Capsules and pills solve this problem for the adult. For children, the problem of coating of medicines is thus far unsolved.

For quite a time I have worked upon the coating of tiny granules of medication with insoluble material: Have tried cacao butter, paraffin of low melting point dissolved in ether, liquid petrolatum, and, though each of these did something in the direction of subduing tastes, none of them was satisfactory. Of late, I experimented with resins, such as mastic and tolu, and believe I have found in the latter an agent that meets the requirements. Mastic does not seem to be more efficient than tolu, and is much inferior to it in flavor.

My aim is to coat each particle of the medicament with a thin layer of resin and then with sugar, which I believe can be accomplished in the following manner: The coarsely powdered (No. 40) or granular drug is stirred up with a suitable amount of a 1 or 2 percent alcoholic solution of tolu. It is then immediately thrown upon powdered sugar on a coarse mesh sieve, say a No. 20 sieve. As the resin-impregnated material is being rubbed through the sieve, it is at the same time converted into granules and coated with sugar. By repeating the sifting several times, and then mixing the granules gently and without trituration, a considerable degree of lessening of the taste of substances suitable for this process can be obtained.

It is of advantage to add saccharin to the tolu solution. For, whenever substances of unequal degree of solubility pass through the mouth, the least soluble material is the one that is tasted most, because it is tasted last, and its taste lingers as long as there is a particle of the substance left in the mouth or pharynx. This lingering taste is best subdued by saccharin.

I therefore use the following solution for the saturating of the medicinal powder of granules:

SACCHARINATED SOLUTION OF TOLU.

| | |
|----------------|-------|
| Tolu..... | 2.0 |
| Saccharin..... | 2.0 |
| Alcohol..... | 100.0 |

TOLU-COATED CALCIUM SALICYLATE.

The problem of the administration of salicylate in "candy form" was not solved in a perfectly satisfactory manner in my previous publications on "Candy Medication."¹ In the series of salicylates studied, *salophen* (acetylaminosalol) gave the best results, both as far as palatability and clinical usefulness were concerned. Of this substance, 0.06 Gm. (1 grain) can be readily administered in a 0.30 Gm. (5 grain) tablet. *Saloquinine*, of which 0.06 Gm. (1 grain) may also be administered in this form, is somewhat less satisfactory, as far as taste is concerned. There are, however, occasions when it may be undesirable to administer the other agent with which the salicylate is combined in the substance mentioned: the quinine in the case of saloquinine, the phenacetin in the case of salophen. Furthermore, salophen has of late been unobtainable in the market, owing to the European war.

Aspirin (acetylsalicylic acid) is so difficult to disguise that not more than 0.015 Gm. ($\frac{1}{4}$ grain) can be given in a 0.30 Gm. (5 grain) tablet; and even then the preparation is by no means perfect. *Novaspirin* (methylene-citrylsalicylic acid) is much better from the standpoint of disguising, 0.015 Gm. ($\frac{1}{4}$ grain) producing practically perfect tablets. Even 0.03 Gm. ($\frac{1}{2}$ grain) may be given in this form. However, the dose is still rather small. Of *magnesium salicylate*, not more than 0.03 Gm. ($\frac{1}{2}$ grain) can be given in this form; and even this dose does not make a perfect preparation.

As only perfectly delicious sweet tablets should be used as "candy medica-

¹ "Candy Medication," C. V. Mosby Company, St. Louis. "Candy Medication," *Journ. A. M. A.*, Jan. 1, 1916, LXVI, pp. 25-28

tion," it is desirable that aspirin and magnesium salicylate be deleted from the "candy materia medica." This can be done all the more readily as we now have in sweet tablets tolu-coated calcium salicylate, prepared according to the following formula, a satisfactory administration form of salicylate.

SWEET TABLETS OF CALCIUM SALICYLATE.

0.06 Gm. (1 grain).

| | |
|-------------------------------------|-----------|
| Calcium Salicylate (granular)..... | 6.00 Gm. |
| Saccharinated Solution of Tolu..... | 3.00 mls |
| White Fat Sugar ² | 24.00 Gm. |

Pour the tolu solution over the calcium salicylate. Stir without pressure, until the granules have been thoroughly moistened with the fluid. Place the white fat sugar upon a No. 20 sieve. Now add the tolu-coated calcium salicylate to the sugar and pass it through the sieve repeatedly, so as to sugar-coat the granules of calcium salicylate as well as to secure thorough admixture. Compress in a tablet machine, using $\frac{3}{8}$ inch die and punches to make one hundred 0.30 Gm. tablets.

Without the tolu and sugar coating, as described in the above process, calcium salicylate is no better than magnesium salicylate for administration in this form. However, owing to its comparative insolubility in alcohol, it lends itself well to tolu coating. That these tablets liberate the salicylate ion can be readily demonstrated by taking a few of them, whereupon the urine will give the characteristic reaction with ferric chloride within two hours.

Inasmuch as tolu and sugar coating promised to be of help in the administration of other medicaments, further experiments were undertaken with this process. It was soon found that, to be suitable for this purpose, the agent must be sparingly soluble in alcohol and in water. Sodium bromide, for instance, does not lend itself to this method of disguising. On the other hand, there is a host of vegetable powders that may well be disguised by this method.

TOLU-COATED SENNA.

Physic is still the most important agent in the armamentarium of the physician. Phenolphthalein and calomel have thus far been the best cathartics from the standpoint of tastelessness; elaterin, podophyllin and jalap, though easily disguised, being too drastic. Calomel can, of course, not be used frequently; and phenolphthalein is a substance that patients readily become habituated to, so that the dose must be increased from time to time. The senna tablets, containing 0.06 Gm. (1 grain), the formula for which had been previously devised,

² *White Fat Sugar* is prepared as follows:

| | |
|---------------------------|-----------|
| Spirit of Peppermint..... | 2.00 mls |
| Fat Starch*..... | 20.00 Gm. |
| Sugar, Powdered..... | 80.00 Gm. |

To the powdered sugar add the fat starch and the spirit of peppermint. Mix and preserve in a well-stoppered bottle in a dark place.

* *Fat Starch* has the following composition:

| | |
|------------------------------------------|-----------|
| Alcoholic Solution of Saccharin, 3%..... | 15.00 mls |
| Liquid Petrolatum..... | 25.00 Gm. |
| Starch..... | 75.00 Gm. |

Mix the starch with the solution of saccharin, and permit the alcohol to evaporate completely. Then incorporate the liquid petrolatum.

were not absolutely perfect. By means of tolu-coating a perfect tablet can be obtained, as the result of the following formula:

SWEET TABLETS OF SENNA (IMPROVED FORMULA).

| | |
|-------------------------------------|-----------|
| 0.06 Gm. (1 grain). | |
| Senna, No. 40 Powder..... | 6.00 Gm. |
| Saccharinated Solution of Tolu..... | 6.00 mils |
| Red Fat Sugar ³ | 24.00 Gm. |

Doubt might be entertained regarding the efficiency of the tolu-coated drug. I therefore experimented upon myself, and found that 0.50 Gm. of senna in form of these tablets gave me violent purgation within eight hours. Even 0.30 Gm. of senna in form of these tablets proved unpleasantly strong in purgative effect after ten hours. I must confess than I am rather sensitive to cathartics. However, there is no doubt in my mind that these tablets are an efficient physic.

TOLU-COATED IPECAC.

In view of the importance of ipecac as an emetic and expectorant, I did considerable experimenting with it; but was unable to subdue its taste sufficiently to administer useful doses of it in perfectly pleasant form. Tolu-coating, as proposed, solves the problem of the administration of ipecac in "candy form." As much as 0.03 Gm. of powdered ipecac can be given, which is practically equal in strength to 1/2 mil of syrup of ipecac, so that two of these tablets would represent the average expectorant dose for adults. A few of these tablets ought to be sufficient to produce vomiting in a child. I felt distinctly nauseated an hour after taking five of them.

The following formula for 0.03 Gm. (1/2 grain) ipecac tablets might, therefore, be considered emetic for children, expectorant for adults. Tablets of 1/10 the strength would give a sufficient dose for expectorant action in children, 3 years of age.

SWEET TABLETS OF IPECAC.

| | |
|------------------------------------|-----------|
| 0.03 Gm. (1/2 grain). | |
| Ipecac, No. 40 Powder..... | 3.00 Gm. |
| Saccharmated Solution of Tolu..... | 3.00 mils |
| Cacao Sugar. ⁴ | 27.00 Gm. |

Process of preparation same as specified in first formula.

³ Red Fat Sugar is prepared as follows:

| | |
|-------------------------------------|-----------|
| Solution of Carmine, N. F..... | 6.00 mils |
| Spirit of Cinnamon, 10 percent..... | 1.00 mils |
| Fat Starch..... | 20.00 Gm. |
| Sugar, Powdered..... | 80.00 Gm. |

Mix the carmine solution with the sugar and permit the powder to dry. Then add the spirit of cinnamon. Preserve in well-stoppered bottle in a dark place.

⁴ Cacao Sugar:

| | |
|-------------------------------------|-----------|
| Spirit of Cinnamon, 10 percent..... | 0.50 mil |
| Cacao Powder..... | 10.00 Gm. |
| Dextrose..... | 10.00 Gm. |
| Sugar, Powdered..... | 80.00 Gm. |

Mix thoroughly by trituration in a mortar, and preserve in a well-stoppered bottle.

To ascertain the relative effects of tolu-coated ipecac and of the drug without coating, one dog was given by stomach tube 0.2 Gm. of ipecac No. 40 powder per Kg. Another dog was given the same relative amount of the same drug, previously coated with tolu and sugar, as described above. Care was taken to permit the tolu-coating to dry before administration. In both cases the drug was mixed with 50 mls of water and injected into the stomach through the stomach tube by means of a large syringe. The results are shown in Table I, from which

| Dog 2. | | Dose | | | | | | | | | | | | | | | | | | | | | |
| | | Tolu ipecac | | | | | | | | | | | | | | | | | | | | | |
| | | 0.2 X Kg. | | | | | | | | | | | | | | | | | | | | | |

X means emesis; b. m., bowel movement.

It will be seen that the effect of tolu-coated ipecac sets in a little later and is milder.

it is evident that some of the emetic action of ipecac is still obtainable from the tolu-coated drug. The action is merely delayed and milder. That drying of the tolu-coating is necessary for reliable results was shown by another experiment in which such care was not exercised, and which resulted in the dog that obtained the tolu-coated drug, vomiting 15 minutes after the administration, while the control animal did not vomit until 48 minutes had elapsed. The emesis was equally frequent in both doses, both dogs vomiting about seven times within the next few hours.

TOLU- AND SUGAR-COATED DIGITALIS.

In view of the importance of digitalis as a medicament, experiments were next undertaken to determine the suitability of this substance and it can be positively asserted that tolu-coating gives a much better product than the form previously developed.

SWEET TABLETS OF DIGITALIS.

(Improved formula.)

0.008 Gm. ($\frac{1}{8}$ grain).

| | |
|-------------------------------------|-----------|
| Digitalis, 40 Powder..... | 0.80 Gm. |
| Saccharinated Solution of Tolu..... | 1.60 mls |
| Cacao Sugar ^b | 29.20 Gm. |

Preparation same as before described.

Twice the dose, that is, 0.016 Gm. ($\frac{1}{4}$ grain) and even more could be administered in perfectly delicious form by means of this process.

Of course, the most important question is whether the tolu-coated digitalis does or does not have the same action as the native drug; for activity is of much greater importance than palatability. A study was therefore undertaken to compare the toxicity of the two forms of digitalis. At first, an attempt was made to

^b Formula in footnote on previous page.

use rabbits for this purpose. It was found almost impossible to kill rabbits with digitalis. As much as 4 Gm. per Kg. did not have uniform effects, some animals surviving and some dying a few days later. The administration of digitalis to dogs leads to vomiting. It therefore became necessary to administer morphine previously, to prevent the emesis. In the experiments about to be reported, 4 Mg. of morphine sulphate per Kg. were given hypodermically one hour before administration of the dose. During this time, the dogs vomited and purged freely. They were then given, by means of the stomach tube, the tolu- and sugar-coated digitalis prepared according to the formula given and permitted to dry, while control dogs were given equivalent doses of the same drug in its native form.

The results are shown in Table II, from which it is evident that tolu-coating does not greatly lessen the toxicity of digitalis to dogs.

TABLE II.

COMPARISON OF EFFECT OF DIGITALIS WITH TOLU-COATED DIGITALIS ADMINISTERED TO MORPHINIZED DOGS BY MEANS OF STOMACH TUBE.

| Dog. | Weight, Kg. | Dose per Kg. | Total dose. | Lived. | Necropsy. |
|-----------------|-------------|--------------|-------------|--------|-------------------------------------------------------------------------------------|
| Tolu Digitalis. | | | | | |
| 1. | 8.70 | 2 Gm. | 17.4 | 1 day | Much digitalis in stomach. Submucous hemorrhages in stomach. Urine contains albumin |
| 2. | 10.00 | 1.5 | 15.00 | 1 day | Much digitalis in stomach. Some gastric irritation |
| 3. | 7.00 | 1.0 | 7.00 | Lived | |
| 4. | 6.00 | 1.0 | 6.00 | 2 days | Stomach almost empty. No albumin in urine |
| 5. | 5.00 | 1.0 | 5.00 | 1 day | Much digitalis in stomach. Upper part of intestine hemorrhagic in spots |
| 6. | 3.60 | 1.0 | 3.60 | 2 days | No necropsy performed |
| 7. | 5.9 | 1.0 | 5.9 | 1 day | Stomach contains moderate amount of digitalis. No albumin in urine |
| Digitalis. | | | | | |
| 10. | 6.50 | 2 Gm. | 13.00 | 1 day | No necropsy performed |
| 11. | 8.00 | 1 Gm. | 8.00 | 1 day | No necropsy performed |
| 12. | 8.60 | 1 Gm. | 8.60 | 2 days | No necropsy performed |
| 16. | 11.40 | 1 Gm. | 11.40 | 1 day | No necropsy performed |
| 13. | 10.00 | 0.5 Gm. | 5.00 | 1 day | Much digitalis in inflamed stomach |
| 14. | 9.50 | 0.5 Gm. | 4.75 | Lived | |
| 15. | 10.00 | 0.25 Gm. | 2.50 | Lived | |

SUMMARY OF ABOVE DETAILED EXPERIMENTS

| Dose per Kg. | Tolu-Coated Digitalis. | | Digitalis. | |
|--------------|------------------------|---------|---------------------|-----------|
| | No. of experiments. | Result. | No. of experiments. | Result. |
| 2 Gm. | 1 | Died | 1 | Died |
| 1.5 Gm. | 1 | Died | | |
| 1 Gm. | 5 | 4 died | 3 | All died |
| 0.5 Gm. | | | 2 | 1 died |
| 0.25 Gm. | | | 1 | Recovered |

It will be seen that there is not much difference in the toxicity of digitalis and of tolu-coated digitalis.

It is interesting to note, in this connection, that morphinized dogs dying within 24 hours of the administration of the poison still hold a large amount of digitalis in their stomach, while dogs dying within 2 days had an almost empty stomach. Inasmuch as the death, in either case, was due to the digitalis, one is led to suspect that the gastric juice is capable of extracting the active principles even from tolu-coated digitalis. It seems fair to infer that tolu-coated digitalis will exert its action in the human being.

CONCLUSIONS.

1. Tolu and sugar coating of granulated medicaments of slight degree of solubility in alcohol and water is distinctly advantageous from the standpoint of disguising.
2. This coating does not interfere with the activity of digitalis, senna and of calcium salicylate. It may lessen somewhat the effect of ipecac upon the stomach.
3. Tolu and sugar coating can easily be carried out by any pharmacist, provided with a set of sieves.
4. The medication, thus disguised, might be administered in the form of powder or preferably in form of compressed tablets.

COLLEGE OF MEDICINE.

SOME COLOR CHANGES IN SOLUTIONS CONTAINING FERRIC CITRO-CHLORIDE.*

BY WILLIAM R. WHITE.

In making a stock solution of ferric citro-chloride, the same strength as the Tincture Ferric Citro-Chloride, N. F., for use in making elixirs, I have frequently noticed a difference in the shade of the green color produced. Seeking to obtain the same shade each time, I proceeded along the lines suggested by Prof. Otto Raubenheimer in his article published in the JOURNAL OF THE A. PH. A., Vol. IV, p. 351. By adding sodium bicarbonate I succeeded in getting the desired apple-green color. The process was tedious and the effervescence annoying, and induced me to make other experiments.

I soon found that not only would alkali carbonates and bicarbonates change the color of the solution from an olive-green to an apple-green but also that the alkali hydroxides would produce the same results; an excess, however, destroys the green color, which changes to a reddish brown.

I next tried the effect of the mineral acids, hydrochloric, sulphuric and nitric, and found that when they were added in excess to a green solution, the green color was entirely destroyed and like with the excessive addition of alkali a reddish brown color produced. Also if the acid is added gradually to a reddish brown solution, produced by the addition of excess alkali, the solution again assumes a green color; continued addition of acid causes the green color to disappear and the solution again becomes reddish brown. By adding alkali to a reddish brown solution, due to excess of acid, the green color is again developed and gives place to the reddish brown color when the alkali is in excess.

These experiments proved that the green color does not persist in a ferric citro-chloride solution unless the acidity or alkalinity is within certain degrees

* Read before Scientific Section, A. Ph. A., Indianapolis meeting.

of limitation. In order to determine the limits of the green zone, 5 mls of the N. F. tincture of ferric citro-chloride were titrated with half-normal V. S. hydrochloric acid and it was found that 8.5 mls of the latter would destroy the green color, and to 5 mls of the same tincture 61.8 mls $\frac{N}{10}$ NaOH V. S. were added to obtain the same yellowish tint with both solutions being made up to the same volume with distilled water. One hundred mls of tincture of citro-chloride of iron then would require 85 mls $\frac{N}{1}$ HCl V. S., and 123.6 mls $\frac{N}{1}$ NaOH V. S.; the end-point, however, was not very sharp and these figures may be considered as approximate.

Having learned from these investigations how to get the desired shade, I then began a series of experiments to find out why the green color of solutions, containing iron citro-chloride, would turn darker when exposed to light. On May 21, 1917, I made up a solution containing 10 percent of a solution of ferric citro-chloride, of same strength as the N. F. tincture and 90 percent of distilled water. To one and one-half ounces I added 10 grains of boric acid; to a like quantity 10 grains of reduced iron; to four ounces 5 grains of potassium chlorate; to three and one-half ounces $\frac{1}{2}$ ounce of syrup. The bottles containing these solutions were placed in a window and exposed to sunlight. To these a bottle with one and one-half ounces of the original 10 percent solution was added, and another like quantity was placed in a box, protecting the solution from the light.

After three days each of the solutions exposed to light liberated carbon dioxide, indicated by tests with solution of lead subacetate and solution of calcium hydroxide; the one with reduced iron had become decolorized, but turned yellow when exposed to the air, which indicated a case of reduction and oxidation.

After three months all of the solutions exposed to light had assumed a reddish brown color except the one with reduced iron and this varied from colorless to brown, always turning darker when the stopper was removed and the solution exposed to the air. The sample not exposed to the light retained its green color with no apparent change.

The discovery of the development of carbon dioxide is in accordance with the work done by W. L. Scoville (JOURNAL A. PH. A., Vol. IV, p. 590), who showed its presence in wine of beef and iron, made with ferric citro-chloride, and he claimed that it was produced by the ferric salt oxidizing the citric acid. J. J. Willaman, in an article entitled "A Modification of the Pratt Method for Determination of Citric Acid" (J. Am. Chem. Soc., Vol. 38, p. 2193), demonstrated that citric acid can be determined quantitatively by the fact that it forms acetone when oxidized by potassium permanganate. Believing that the citric acid is oxidized by the ferric iron and thinking that perhaps acetone might be formed in the solutions under consideration, a test was made which proved its presence.

An effort was then made to discover what would restore the green color to solutions of ferric citro-chloride which had turned brown by the action of sunlight. It was found that the addition of the mineral acids named would lighten the solutions materially, and in those which had only turned a reddish brown, the green color would be partially restored.

Citric acid was added and produced the same results in restoring the green

color and it was found that an excess of it would not cause the reddish brown color produced by excess of the mineral acids, therefore citric acid seems best suited for restoring the green color. However, when citric acid was added to an elixir of calisaya and iron, made about a year previous that had turned black, the citric acid alone failed to restore the color, but with the further addition of reduced iron the solution was restored to a light yellow color.

It was found that the green solutions responded to the test for ferric iron, while those of a reddish brown color to a ferrous condition.

SUMMARY.

The following conclusions have been reached:

1. That acids and alkalies beyond certain limits will destroy the green color of solutions of ferric citro-chloride, and these limits have been approximately determined.
2. That in solutions of ferric citro-chloride, exposed to sunlight, the citric acid is decomposed with the formation of carbon dioxide and acetone, and it is probable that the sodium liberated combines with the chlorine, lessening the acidity; the restoration of the color by the addition of acids indicates this.
3. That the iron exists in the green compounds in the ferric state and is reduced to the ferrous in the reddish brown and colorless solutions.
4. That citric acid can be used to lighten solutions and elixirs when of a reddish brown color, but that citric acid and reduced iron should be used together when these preparations have turned black.
5. That the green color is more than likely the result of a new compound of sodium citro-chloride and that the excess of acids destroys this. An excess of alkali in all probability causes the formation of ferric hydroxide, producing a reddish brown color.

The work done so far on this paper is presented in the hope that it will stimulate further investigation of this important subject.

Samples of the various products were shown.

ABSTRACT OF DISCUSSION.

W. L. SCOVILLE: This work of Mr. White is very interesting and practical; we need more of that kind on the iron preparations. This whole question of the physical chemical qualities of iron has got to be worked out from the bottom up. Prof. Stevens started an investigation some years ago, but he did not have time to finish it. We must consider that iron has an acidic as well as a basic character. We have a class of compounds known as the ferrates. Now there seems to be a condition in which the iron takes on the acidic character, and in which it is very sensitive to chemical change, not so much in itself, but in the agents with which it is combined. This action on the citric acid is simply an evidence that the iron is probably active in its acidic character.

I hope some day the universities will take up the whole question of the physical properties of iron, and give us the fundamental principles under which these color changes, as well as other changes, in the iron actually take place.

C. P. WIMMER: I might add that the problem, to my mind, is more of a color chemical problem all the way through, because I believe, for example, that this solution of iron citro-chloride is a colored solution and when the iron chloride is dialyzed out citric acid will be left. I want to substantiate what Prof. Scoville has said, that this aspect of the iron salts presents untold possibilities for research. I have done some work on it, and I hope by another year I will be far enough advanced to make a report on it.

PRACTICAL PHARMACY SECTION

THE CARREL-DAKIN SOLUTION PHARMACEUTICALLY AND PHYSIOLOGICALLY CONSIDERED.*

BY ST. CLAIRE RANSFORD-GAY.

There has been no preparation of recent years, excepting, perhaps Normal Saline, which in effectiveness and simplicity has equaled the Carrel-Dakin solution, and in conceding that it is a most wonderful and practical application of scientific phenomena, we simply prove that it is not necessary, nor is it expedient, to tamper with the laboratory of nature, in order to obtain perfect products for the restoration of body balance. Therefore, synthetic products, while perhaps identically the same in formula but reinforced through the benzole ring, not being natural, do not contain the same amount of energy that is found in the natural product, hence disease will respond, if at all to these latter compounds, only in proportion to the amount of their potential force, which through the agency of the body is convertible to kinetic energy. This is the reason that synthetic preparations for instantaneous use, now marketed in such great profusion, have failed to give satisfactory results, in the hands of experienced practitioners, and, moreover, have seriously interfered with the use of the original solution.

A word as to the best method of manufacture and keeping yet found by us, and some hints from practical experience with a product that corresponds with all of the requirements set down by Dr. Carrel may be an aid to those who for themselves have not had an opportunity to do any special work along this line, and, as well, will serve as an excuse for the reason why this solution should be regarded as purely individual in its curative factors, and general only inasmuch as it contains all the materials for promoting healthy granulation, but the use of the solution must be modified to suit the condition to be treated.

The following formula, with which we obtained the best results, does not appear to be balanced, but a little pharmaceutical arithmetic will show that when U. S. P. salts are used the resulting solution will contain 0.5 percent of sodium hypochlorite, with small amounts of neutral sodium salts:

| | |
|-------------------------------------|------------|
| Chlorinated Lime ¹ | 200 Gm. |
| Sodium Carbonate (Dried)..... | 100 Gm. |
| Sodium Bicarbonate..... | 50 Gm. |
| Distilled Water..... | 10,000 mls |

When made on a large scale, say 25 to 50 gallons, it is very easy to siphon off the supernatant liquid, and filter it, so as to obtain a clear solution, but the manufacture of small quantities is troublesome. It must be understood, too, that the process is not merely one of adding the salts to the water, making the solutions and immediately pouring one into the other, thus obtaining in say an hour, a product

* Read before Section on Practical Pharmacy and Dispensing, A. Ph. A., Indianapolis, meeting, 1917.

¹ Based on strength of 25 percent chlorine determined by titration; a corresponding amount must be used if the chlorinated lime is not of this strength.

fit for use. No indeed, nature takes just so long to act, and in hastening her action, we are depriving the finished product of just so much energy, and that will be manifested in the finished product, when titrated. The following technic and method of keeping, if carefully followed, will give a product which will obviate the necessity of making the solution fresh every three days and thus lower the cost to those who are unable to pay for the extra labor and great waste of material thus entailed. It is the high cost of this solution to those of limited means that keeps many physicians from using the solution even when the necessity is very great. The chlorinated lime U. S. P. should be put into a large bottle, and half of the water added. This is well stirred during six hours, and allowed to stand over night. The sodium salts are dissolved separately, each in a quarter of the remaining water, and allowed to stand over night. In the morning the sodium bicarbonate solution and the precipitate are poured into the chlorinated lime, and the whole well shaken. The sodium carbonate solution and precipitate are then added quickly so as to absorb readily the nascent chlorine which has been previously liberated by the sodium bicarbonate. (We have found that because of its greater solubility in cold water, the lime should be treated with water at a temperature of from 55 to 60° F., and kept at that temperature until the sodium salts are added, they too being in as cold a solution as possible.)

The mixture is now well stoppered, shaken thoroughly for ten minutes, and then allowed to settle. The supernatant liquid is siphoned off, and though filtered through paper, the stem of the funnel is well packed with asbestos, because the quality of the filter paper on the market at the present time leaves much to be desired as far as strength is concerned. The finished product is a clear liquid, with a marked odor of chlorine, which when titrated according to this method, contains 0.5 percent sodium hypochlorite.

"Put 20 mils of solution in a glass, and pour on the surface a little, say 2 cgm., of phenolphthalein powder, and shake with a circular motion, as in rinsing. The liquid should remain colorless, a red discoloration indicating free alkali or too little carbonation which must be corrected before titration."

"Titration: To 10 mils of the solution add 10 mils of distilled water, 2 Gm. of potassium iodide, and 2 mils of acetic acid. Pour into this mixture a $\frac{N}{10}$ (2.48 percent) solution of sodium hyposulphite, until it is decolorized. The number of mils of hyposulphite solution, multiplied by 0.3725, equals the percentage of sodium hypochlorite in the solution." This method is very simple and accurate.

All the technic, however, is not confined to the manufacture, which, as previously stated, should be carried out at as low a temperature as possible, and with as little light (natural or artificial) as convenient. After the solution has been filtered, it should be put up in well corked bottles and kept in the ice-box away from light. In this way it is possible to keep the solution for several weeks without deterioration, but in spite of the fact that these are ideal keeping conditions we titrate it each time before dispensing. The patient and doctor should be advised to observe this method of keeping the solution.

When the solution has turned lavender, it is no longer fit for use. In spite of the fact that every precaution has been exercised in the technic, the doctor sometimes fails to obtain his results, and despite argument on the part of the pharmacist,

he is convinced that it is the fault of the solution. It may be well then, to bear, in mind the following: This solution without dilution, is admirably suited to what may be termed the gross wounds of the battlefield, for two reasons: first, the men sustaining the wounds have gone into battle in perfect physical condition and are really physically "fit" and the infection being recent and local, the system is depleted only from shock and a normal loss of blood because under these conditions clotting must occur in the normal time. Therefore a great deal of the energy of the solution is used up in the removal of all effete material, and the remaining energy of the sodium hypochlorite serves to disinfect the wound, and to promote healthy granulation of the wounded area. If you will notice Dr. Carrel's method of using the solution, you will see that after the granulations have arrived at a certain point, the irrigating then proceeds only at intervals, and the strength is accordingly decreased.

Take, however, the typical hospital case, first of all, only a very few of the ward cases enter the hospital in good condition. Then if the patient has a septic condition warranting operation, the chances are ten to one that it has passed the local stage. Therefore, a solution containing 0.5 percent sodium hypochlorite will not be isotonic with her blood serum, as she will already have more sodium than she can take care of, due to the infection, and an additional amount in the solution will do more harm than good. It is well, therefore, to begin operations with a dilute solution, and to increase the strength if necessary, and we have found that in the irrigation of a kidney, the bladder or the vagina that the solution should be diluted from one-half to one-third. If, therefore, the strength of the solution is adapted to the individual case, even the most inexpert practitioner will be able to obtain results, provided that he supplements his treatment with the other salts required for the maintenance of and the restoration of the body balance which has been so disturbed by the septic condition that an anemia or worse may be the result if great care is not used in the after-treatment of the surgical condition.

UNITED STATES PUBLIC HEALTH SERVICE.

List of changes of duties and stations of commissioned and other officers of the United States Public Health Service for the seven days ended February 13, 1918.

Pharmacist J. A. Wolfe. Return to station, Philadelphia, Pennsylvania. Feb. 12, 1918.

Sanitary Engineer C. N. Harrib. Proceed to Augusta, Ga., on special temporary duty. Feb. 8, 1918.

Sanitary Engineer H. W. Van Hovenberg. Proceed to New Orleans, La., for duty in malaria investigations. Feb. 6, 1918.

Sanitary Bacteriologist E. M. Meyer. Proceed to Berea, Kentucky, for duty in investigations of meningitis. Feb. 4, 1918.

Sanitary Inspector Virgil H. Robinson. Relieved at Tacoma, Washington. Proceed to Seattle, Washington. Feb. 8, 1918.

Pharmacist J. M. Bell. Relieved at the

Savannah Quarantine Station. Proceed to Norfolk, Va. Jan. 30, 1918.

Sanitary Engr. J. A. A. Le Prince. Report at Bureau for Conference relative to malaria. Jan. 30, 1918.

Sanitary Bacteriologist C. F. Butterfield. Relieved at Manhattan, Kansas. Proceed to Columbia, S. C., on special temporary duty. Feb. 2, 1918.

Special Expert W. C. Purdy. Proceed to New Orleans, La., for training in laboratory procedures relating to malaria. Feb. 1, 1918.

PROMOTIONS.

Pharmacist Cletus O. Sterns. Promoted and appointed a Pharmacist of the first-class, effective November 5, 1917. Pharmacist Walter H. Keen, promoted and appointed Pharmacist of the first class, effective December 31, 1917. Jan. 23, 1918.

COMMERCIAL SECTION

A MOVING WINDOW DISPLAY.*

(A Demonstration.)

BY OTTO RAUBENHEIMER.

This is not a paper but merely a demonstration. Like many discoveries, mine was brought about quite accidentally by being one of the few pharmacists in the United States who make their own milk of magnesia, which can be prepared for thirty cents a gallon, instead of thirty-five cents per 12-ounce bottle.¹ In the process, I used a syphon to remove the wash water. On one occasion the rubber tubing contained a little pin-hole. To my great surprise this little leak produced a peculiar phenomenon, *vis.*, air bubbles formed and were drawn down with the water, thereby producing a very striking effect.

This gave me an idea. I concluded to use this arrangement for a window display. In the rubber part of the original syphon, the little pin-hole got gradually larger and larger, until there was more air than water, and consequently the flow stopped. So I had to give the display up temporarily. I wondered how I could contrive to continue it, as it had proved quite an attraction. I found a way, and I have come here to show you just how it was done. The display was in my window for eighteen years and many people saw it. As the life of a patent is only seventeen years, I feel that I have kept the idea to myself long enough, and I am willing to part with it now for the benefit of the A. Ph. A. members, attending the Commercial Section at the Atlantic City Convention.

I have received inquiries about it from all over the United States. People wrote to me and asked me how it was done, and I told them that if they would come to Brooklyn I would show them.

All that it is necessary to use is a glass "Y" tube, which can be bought for about fifteen cents. On one of the upper ends of the "Y" tube I attach a short rubber hose, on which there is a metal screw compressor. This I can regulate by tightening it or gradually loosening it. This screw compressor costs twenty-five cents. The other upper end of the "Y" tube is connected with a piece of glass tubing which acts as the short leg of the syphon, namely, the one which sucks up the water. The lower end of the "Y" tube is connected with a long glass tube, the long leg of the syphon, which is the water outlet. I had glass tubing going all over the window, but I could not bring it all. I merely brought a few pieces of tubing to demonstrate the way the apparatus works. The more glass tubing you have the more of an attraction the display will be. I ran the tubing over signs in the window, and also connected it with a Liebig condenser, used to demonstrate the distillation process.

I will now explain how I made the action continuous. To connect the pieces of glass tubing, I use rubber tubing. At the outlet I attach another screw com-

* Delivered before Section on Commercial Interests, Atlantic City meeting.

¹ Proceedings A. Ph. A., Vol 55 (1907), p. 150.

pressor to regulate the flow. The syphon is best started without admitting any air. The way it is regulated now, there is but very little air admitted. It shows up better when the liquid is not clear like water, but colored. By slightly opening the screw compressor on top, you will see that a little air enters and comes through along with the water, thereby forming air bubbles. The size of these can be regulated by admitting a little more or a little less air. In the same way, the outflow can be regulated by the screw compressor, so as to make the water and air run through more slowly or faster. The larger and long air bubbles with their convex ends very closely resemble hard gelatin capsules.

The display in my window frequently attracted so many people that the police had to come and drive them away. They were all guessing what made it go. I had the "Y" tube high up in the window, so that it was concealed. When the water reservoir on top got empty, I would, of course, have to fill it again. Not wanting to be bothered with that, I connected it with a running stream of water by means of the faucet, which I turned so that the water would run in just as fast as it ran out. After that, I usually did not have to bother with it from the time I turned it on in the morning until night. I fixed it so that the bottle, which acted as the water reservoir, was about half full all the time. Of course, I had to keep my eye on it, as the water pressure sometimes varies.

I hope that this demonstration of a "Moving Window Display" will convince the members of the A. Ph. A. that even a little knowledge of physics and chemistry can be utilized to convince the public that your pharmacy is different from your neighbor's, who displays patent medicines, suspensories, dolls, or still worse, "apples."

ABSTRACT OF DISCUSSION.

J. B. THOMAS: The manufacturers of soda drinks are using the same idea. Two colored men were standing before the window in which this was shown in connection with the soda water, and wondering at the mysterious disappearance of the water, one said, "Say, John, where do you suppose that is coming from?" The other replied, "It is not so important where it is coming from as where it is going to."

R. S. LEHMAN: This idea is being used for advertising purposes in the shape of a glass sign. There is one now in New York, which has been there quite a long time. There are letters, forming the words "Havana Cigars," which run in a continuous glass tube. The end of the word "Havana" joins the end of the word "Cigars." There is always a little globule of air around the letter.

CHARLES H. LAWALL: I am wondering whether Dr. Raubenheimer ever had the experience of trying to syphon a liquid of lower density through one of higher. In a laboratory where I was once employed, we often had occasion to syphon liquids, and it was customary to fill the syphon with water before starting, and then immerse the syphon in the liquid to obtain the flow. On one occasion, chloroform was the liquid to be syphoned. The operator filled the syphon with water and immersed it in the chloroform. The chloroform came up to the top of the bend, but did not displace the water, but bubbles of chloroform went down through the water, just as the bubbles of air in the syphon of Dr. Raubenheimer.

OTTO RAUBENHEIMER: That is a new experience; of course, air is a good deal cheaper than chloroform.

SECTION ON EDUCATION AND LEGISLATION

ARE COLLEGES OF PHARMACY DEVOTING SUFFICIENT TIME TO DISPENSING?*

BY ARTHUR W. LINTON.

The Pharmaceutical Syllabus defines Dispensing Pharmacy as "the extempore preparation or compounding of medicine." The Syllabus states that "the minimum time devoted to this subject shall be sixty hours, which should be arranged to give a liberal number of hours for actual work in the compounding of prescriptions." It should be noted that according to the outline of the Syllabus many of the classes of extemporaneous preparations, such as ointments, plasters, and suppositories, have been taken up in the second year's work in manufacturing or galenical pharmacy, and typical preparations of each of these classes made by the student before he meets them in actual prescriptions. Furthermore, the Syllabus provides for a twenty-five hour course in Pharmaceutical Latin entirely aside from the dispensing course.

For the purposes of this paper let there be understood by Dispensing Pharmacy the extemporaneous preparation of medicine, including the study of such classes as pills, powders, and ointments; the consideration of the written prescription; the study of the great subject of incompatibilities; and the actual practice in dispensing physicians' prescriptions in the college laboratory.

The writer has devoted considerable time to study of the catalogues of the colleges of pharmacy of the United States with the view of learning how much time is set aside in the curriculum of the average school to the subject of dispensing. Several difficulties presented themselves in securing the desired information. It was found that a great many of the catalogues were exceedingly indefinite in their statements as to amount of time devoted in class-room and laboratory to prescription work. In some cases rather extravagant statements were made in regard to completeness of equipment and thoroughness of the course, but the reader was left absolutely in ignorance as to the number of hours per week given to the work, as well as to the number of weeks through which the instruction continued.

Another difficulty in making a fair comparison of the colleges in this matter was the great diversity in arrangement and grouping of the work. In some schools, for instance, the study of the classes of preparations commonly dispensed extemporaneously is first taken up in manufacturing courses, in other colleges the student apparently meets these for the first time in his dispensing course. In some institutions the curriculum provides a separate course in Pharmaceutical Latin, while in others whatever instruction in Latin is given is included in the dispensing courses.

Twenty or more colleges were found to make quite definite statements in their catalogues as to the time assigned to dispensing. It may be noted that most

* Read before the joint session of the Section on Education and Legislation, A. Ph. A., the American Conference of Pharmaceutical Faculties and the National Association of Boards of Pharmacy, Indianapolis meeting, 1917.

of these are members of the American Conference of Pharmaceutical Faculties. Some of those making definite statements offer one course consisting of lectures and recitations and another of laboratory work; others combine lectures, quiz, and laboratory practice in one course. This is a minor matter; it makes little difference under what classification the work is given so long as it is given in sufficient amount and with proper thoroughness.

In regard to the amount of work in dispensing, it was found that among those colleges making reasonably complete statements there was quite a wide difference in time assigned. One college, so far as could be learned from its announcement, devoted only 32 hours to dispensing; at least three institutions were well above 200 hours. The average time devoted to lecture and class-room work in these twenty colleges is not far from 36 hours, the average time to laboratory about 72 hours. Among those colleges stating the value of their dispensing courses in terms of university hours of credit, the average was about five hours. Many at least of the twenty or more schools referred to above also include extemporaneous preparations in their manufacturing courses. If 108 hours, or thereabouts, is the average for those colleges making definite statements in regard to dispensing, it does not seem probable that the time given by other institutions will average higher.

It will be noted, then, that many of our American colleges of pharmacy are using for instruction in dispensing almost twice the minimum number of hours suggested by the Syllabus. Judged by this standard, these schools are doing all that could be expected. However, the writer is convinced that even 108 hours is considerably less than the time required to give adequate instruction in regard to the prescription and all that pertains to it.

Shall we consider first the class-room instruction, or what may be called the theoretical part of the work? The writer, from his own experience and observation, believes that this should include not less than 72 hours. He would suggest a course of one semester of 18 weeks, two hours per week, given to the study of the written prescription in all of its aspects, and to the various classes of extemporaneous preparations. Even if the student has studied these classes and made some typical members of each in previous courses, his knowledge of them at this time is usually quite elementary. Ample time is necessary for detailed consideration of special cases. The instructor may use a part of the time of this course for lectures, but a standard text-book on dispensing should be in the hands of the students, lessons be assigned for study, and much time allowed for quiz and discussion.

During the following semester 36 hours of class-room work should be devoted largely to the subject of incompatibilities. After a consideration of the general subject and of the various classes, the incompatibilities of the principal chemical groups should be taken up systematically. These should be illustrated by numerous prescriptions, which, if possible, should be thrown upon a screen for comment. A part of the time of this semester should be reserved for the more important of the newer remedies, with suitable discussion of their composition, physical and chemical properties, and incompatibilities.

The laboratory work in dispensing should run concurrently with the class-

room work. Following closely on the discussion of each class of preparations in lecture and quiz, this class should be taken up in the laboratory and numerous typical prescriptions of the class dispensed. Using ointments as an example; there should be prescriptions illustrating the incorporation of an insoluble powder, of a water-soluble solid, of an oil-soluble solid, and of a soft extract; ointments made with various bases and combinations of bases; ointments made by mechanical incorporation and ointments requiring fusion; ointments that can best be prepared on a slab, and ointments requiring levigation in a mortar; ointments dispensed in jars, and ointments dispensed in collapsible tubes. At least twelve or fifteen ointment prescriptions should be dispensed to cover these various cases. Some time can be profitably spent in the microscopical examination of samples of the ointments prepared, in order that knowledge may be gained of the efficiency of various methods. All of this will require time. If the prescriptions are so chosen that each one presents some new problem or difficulty to the student, he can not be expected to compound them with the speed of an experienced dispenser. He should be required to label and wrap each prescription as in actual practice. For this semester's work he should have not less than four hours per week in the laboratory, or a total of 72 laboratory hours.

During the second semester, while the subject of incompatibilities is being taken up in lecture and quiz, a great many of the prescriptions dispensed should be chosen to illustrate the principles discussed. The student will need time to experiment with different methods of overcoming certain difficulties. In some cases it will be profitable for him to compound a prescription by two or three different methods in order to compare results. Many prescriptions should be set aside and observations taken at intervals in order that color changes and precipitations may be noted if such occur. Of course it will be quite impossible for the student to experiment with all of the possible incompatibilities, but it is only by doing a large amount of such work that his resourcefulness is developed and he becomes fitted to cope successfully with the innumerable difficulties which arise at the dispensing counter. During this semester the student should be encouraged to bring in difficult or unusual prescriptions received in the store in which he is or has been employed, and should be given opportunity to experiment with methods of compounding the same under the advice of the instructor.

The prescriptions assigned during the second semester should include many of the important new remedies. The various organic compounds of silver, for example, present their own peculiar problems, and some of these compounds are very commonly prescribed. The subject of sterilization is assuming such tremendous importance that no dispensing course is complete which does not devote considerable time to it. Can anything less than 72 hours of laboratory work be considered sufficient for the second semester's course in dispensing? We would suggest, therefore, 72 hours of class-room work and 144 hours of laboratory practice, or a total of 216 hours, as the minimum time for dispensing work in the college course.

Some one objects: "Oh, it is impossible in the college prescription work to familiarize the student with all of the difficulties which may arise, we can teach him only the broad principles." Quite true. The writer is perfectly aware

that if all of the time of a two-year course were devoted to prescription practice, so infinite is the variety of possible combinations, that even then the young pharmacist would probably encounter in his first week of store experience something new and puzzling. No matter how long the school course or how extensive one's practical experience, it is only by reasoning out each new difficulty as it arises that one becomes a safe and successful dispenser. However, the college instruction in dispensing should be sufficiently extensive to familiarize the student with most of the typical cases, and, furthermore, to give the embryo pharmacist confidence in his own ability. Let a student make two or three emulsions, and it is quite probable that he will go out regarding emulsions as an unfamiliar and a treacherous class of preparations. If he happens to encounter an emulsion prescription somewhat different from those he dispensed at school, he is afraid of it, and will probably make a failure in compounding. Let him dispense enough emulsions in the school laboratory to come to a thorough understanding of the principles of emulsification, and he will receive emulsion prescriptions with confidence and even with pleasure, for what is of more satisfaction to the pharmacist than to dispense a well-made emulsion?

Doubtless one of the reasons that more time has not been devoted to prescription laboratory work in our colleges is the high cost of this instruction. The laboratory equipment, if at all adequate, is expensive. The cost of material used, if representative prescriptions are assigned, is considerable. Further, if the class is divided into small groups, as it should be for this kind of work, a great deal of the instructor's time is consumed. Hence the tendency has been to use most of the student's laboratory time in courses which required less expensive equipment and material, and in which the instructor can oversee the work of a larger group of students. Let us hope that the condition which has almost necessitated the neglect of so important a part of the curriculum will be gradually overcome. State authorities and legislative bodies will slowly come to understand that instruction in pharmacy, as in medicine, is expensive, and will become willing to provide the funds necessary for equipment and instruction. Institutions not under state control will find other means of adding to their incomes.

Another reason that dispensing work has been somewhat neglected is the difficulty of finding time in the crowded curriculum of the two-year course for all that should be done. While the writer is inclined to believe that a small amount of the time now commonly given to chemistry might better be devoted to prescription work, he will not contest this point, for it is quite certain that our students are not giving too much time to chemistry. Qualitative analysis, especially, is a splendid preparation for the study of incompatibilities. It is by the extension of the pharmacy course to three years that we must hope to find the additional time so urgently needed for a proper study of the prescription and a reasonable amount of practice in dispensing. The writer would urge upon those faculties which are introducing a three-year course the serious consideration of assigning more time to prescription work than was possible in the two-year course.

We will all agree that in compounding physicians' prescriptions "just right," the pharmacist is rendering to the public one of the highest services which comes within his sphere of activity. Why, then, should the preparation for dispensing

not be given a more prominent place in the education of the pharmacist? More emphasis on this work in our colleges, better equipment and adequate time for instruction, will mean that our college graduates will be better prescriptionists. It will mean more young pharmacists entering business with the determination that no matter what side-lines may be introduced, their stores will be prescription stores. Better prescription service will certainly mean more prescriptions written; it will go far to correct the omnipresent evil of the dispensing doctor. The writer believes that as pharmacists, whether practitioners or teachers, we should spend less time in bewailing the fact that physicians are not writing prescriptions, and more time in preparing ourselves to give dispensing service of the highest possible order.

Let all recognition be given by our colleges to the commercial aspects of pharmacy. Let courses in commercial pharmacy, store-management, drug-store accounting, and show-card writing be introduced and strengthened. The three-year course should give time for these also. But let us not neglect to provide for more instruction and better instruction in dispensing.

UNIVERSITY OF WASHINGTON,
COLLEGE OF PHARMACY.

PRIVATELY OWNED SCHOOLS AND COLLEGES OF PHARMACY.*

BY EDWARD SPEASE.

This subject is similar to one upon which I offered a paper one year ago. My paper at that time was either too insignificant to merit recognition, or every one endorsed my opinions. I can hardly credit the latter statement as being a fact, and so must content myself with the former one, and try again.

I am not trying to find fault with the views of other people—many of whom have had many more years of experience in educating pharmacists than have I—but as I gain age and experience, the questions present themselves to me—Is pharmacy worth while? and, Does every class of pharmacists make the proper unselfish effort to build up pharmacy? and, Are they all proud of the profession they have chosen?

I ask myself, Why is the pharmacist often a man of small vision? Is it his multitude of small sales that makes him so? Why do the majority of pharmacists—and often now, the layman—make the statement: "Ethical pharmacy is a thing of the past; I must develop the commercial side of my store." By the commercial side is meant, I suppose, the patent medicine business, sundries, cigars, candy, etc., as well as the various lines of preparations put up by various pharmaceutical houses whose sale has made some of these manufacturers immensely wealthy.

The tendency, generally speaking, or at least in the majority of cases, is to draw away from prescription work and the manufacture of our own preparations

* Read before the joint session of the Section on Education and Legislation, A. Ph. A., the American Conference of Pharmaceutical Faculties, and the National Association of Boards of Pharmacy, Indianapolis meeting, 1917.

and compounds—even to draw away from the manufacture of U. S. P. and N. F. preparations.

Why do our leaders in pharmacy—many of them—advise us to associate ourselves with the patent medicine interests, yes, even with the vendors, for mutual self-protection in legislation? It must be because we are weak in ourselves.

Why are we not aligned with and on an equal footing with the best in the medical profession? Is the fault altogether that of the medical man?

Why have many of our pharmaceutical manufacturing houses made, and even solicited the making of patent and so-called "fake" medicines?

They will answer, of course—"to prevent these fellows from manufacturing them themselves, and likewise, from an altruistic standpoint, so that these medicines may be compounded by experienced pharmacists, and the danger to the public minimized."

Why do many of our manufacturers sell directly to physicians? Are they fearful lest the doctor manufacture for himself? Why is the physician merely a dispenser of pills and tablets—"canned medicines?" Why does the manufacturer find a market for solutions of cocaine ready for use by the doctor? Why does he make dispensing tablets?

Do our manufacturers all work for the best interests of our pharmacy schools, or do any of them ever interest themselves or permit their scientific men to teach in private schools, run solely for profit, Y. M. C. A. schools of pharmacy, and the like? If they do, does this help pharmacy, and help it ethically?

I have heard many men make the statement that they would be glad if never a prescription came in to them, because their help could make more money for the firm on the floor selling patents.

Why is it that of the many state boards of health commissions, committees and the like on health matters, existing and being appointed in our various states at all times, even those now for National Defense, the pharmacist is never regarded as a necessity? The veterinarian and the dentist, in these latter days, and always the physician—are chosen to serve the public in these groups.

We clamor at times for recognition of the pharmacist, but do we ever get behind the slogan "for the good of the public health?"

Why are not all our pharmaceutical associations in the same chain, and why do they not exist for the same purpose—the good of pharmacy and the uplift of the profession?

Would not the combined money spent by the N. A. R. D., the A. Ph. A., the jobbers and the manufacturers, go a long way towards getting proper legislation for us and placing us once more on an ethical footing?

I have heard one member of the Revision Committee of our own U. S. P. IX say substantially that medicine is now an exact science, and that only known chemical compounds will be used in the future; that the field for pharmacy is practically eliminated, and that mixtures like tinctures and such preparations of vegetable drugs will soon pass out of use.

We hear the manufacturers say not to make any of our own fluidextracts, tinctures and things that they make; that the retail man's time is too precious to devote to such things, and besides, the trained scientific man in the manufac-

turers' laboratory is better fitted to prepare these things. This statement also came from another member of the U. S. P. IX Revision Committee.

Now, what does all this have to do with "Privately Owned Schools?" Just this: Is it the fault of these schools who first educated our pharmacists and whose graduates are the most active men in our profession to-day? Is it the fault of the university schools who came later, and the majority of whose graduates are comparatively young men?

I ask these questions for information only, and not to criticize. I feel it the duty of our Association to investigate these conditions, even to the point of banishing from our ranks individuals—if there be any—who stand opposed to the uplift of pharmacy.

Our schools should be the places where our pharmacists are trained, and there they should imbibe true pharmacy and a desire for better things. Do they?

Can a pharmacy school exist on tuition alone? Must it not have a large endowment, or receive State aid? I should like to know what it costs to educate a pharmacist, giving him the meagre training we now do. I have it on good authority from one of our medical schools, that the tuition per year is \$125.00, but the cost to the school is \$800.00 per student. Does it cost that to train a pharmacist?

Professors of pharmacy should be so trained that they can command big salaries, and these salaries should be forthcoming to them. Why do I harp on this old string? Because if properly paid, there would be enough of them so they could devote time to research, and not have to turn the eye toward commercial pursuits. Can the time ever come when private schools will ever approach this ideal? Never.

It has been said that universities will not recognize the merits of our schools of pharmacy. This is really so, in some cases, now. We can obviate these conditions by placing pharmacists upon university boards that control these matters, and then our university schools will be provided for properly.

Do our private schools, if there be any, really stand for better things? Is it not time that our Association as a whole desist from merely appointing a small committee on education and legislation—which of course go hand in hand—and really do something more in the matter of proper *education* for the pharmacist? *Legislation* will then come.

I ask you older men if it is too late to begin?

I did not write this paper in the spirit of fault-finding and scolding, but for the sake of receiving answers to my questions, if there are any.

CLEVELAND SCHOOL OF PHARMACY OF
WESTERN RESERVE UNIVERSITY.

WOMEN'S SECTION

WOMEN'S SECTION, AMERICAN PHARMACEUTICAL ASSOCIATION.*

MINUTES OF FIRST SESSION.

The Sixth Annual Session of the Women's Section of the American Pharmaceutical Association was called to order in the parlor of the Claypool Hotel, Indianapolis, Indiana, Wednesday, August 29, 9.30 A.M., by the President, Mrs. E. A. Ruddiman.

Rev. Dr. Allan B. Philpott invoked the Divine blessing. Following the inspiring words of trust and faith in Divine guidance during the progress of the Convention, the meeting was entertained by Mr. Arnold Spencer, who sang three numbers—Love Song, by Nevin; At Parting, by Rogers; Over the Desert, by Kellie. Mr. Spencer was accompanied by Mr. Arnold Coppock at the piano.

In behalf of the pharmaceutical organizations of Indianapolis, Mrs. F. R. Eldred extended a glad welcome to the members of the Women's Section in the following well-chosen words:

Madam President, Ladies of the American Pharmaceutical Association.—In behalf of the hostess city and the local organizations, I extend to you a most cordial welcome. We trust the few days spent in our winter capitol will prove pleasant as well as profitable days for all in attendance.

Unfortunately, the annual convention of the American Pharmaceutical Association is held during our warmer months; but whether we meet in Nashville, the attractive and picturesque capitol of Tennessee or in Atlantic City, a delightful resort of the great American public in summer, we return to our homes, I feel assured, benefited in many ways. How sweet, too, the renewal of old friendships as well as the forming of new ones!

We have with us women pharmacists, pharmacists' wives and daughters, all interested in the growth and promotion of one of the greatest factors in the life of the nation, and certainly of vast importance in the great war of to-day in which we are all so vitally interested. Therefore, we women of the American Pharmaceutical Association should unite and, by coöperation with our government, succeed in doing our bit, and more, for coöperation is the keynote to success.

In behalf of the Women's Organization of the N. A. R. D., Mrs. F. H. Carter extended a welcome to all:

Madam President, Ladies of the Women's Section of the A. Ph. A.—The Women's Organization of the National Retail Druggists, with a full heart and open mind, is glad to welcome you and to make you feel that in coming to Indianapolis you have made no mistake. Hoosier hospitality is of a kind that has no competitor. The joy of meeting you overlaps all feelings of formality. We are just one great big family. We welcome you.

In behalf of the state organization, a welcome was to have been extended by Mrs. F. W. Meissner of La Porte, but a disastrous fire which damaged their business place the day preceding this meeting, detained her and she was unable to be in attendance but sent a lettergram of regret and greeting.

The President then called the Second Vice-President, Mrs. George M. Beringer, to the chair during the reading of the President's address.

The President, Mrs. E. A. Ruddiman, then read as follows:

THE CHAIRMAN'S ADDRESS.

On behalf of the members of the Women's Section of the American Pharmaceutical Association, I wish to thank the ladies of Indiana and Indianapolis for their very cordial welcome. We are anticipating a delightful stay in your city and the few hours already spent here show that we will not be disappointed.

* Papers will be printed apart from the minutes of the Section.

And to you the members of this Section, I bring greetings and good wishes. We are glad to welcome you and hope that your pleasure and profit will be so great, you will always desire to attend our annual meetings. We wish to bespeak your cordial coöperation in the work of our Section, and ask that you will attend the sessions, both business and social. We would welcome any suggestions making the Section more efficient or its meetings more profitable. By all working together we hope to make this the most interesting meeting the Women's Section has ever held.

I might speak to you about many things of interest to this Section, urging you to keep up agitation for shorter hours in drug stores; to work for higher standards of education for pharmacists; to secure uniform requirements for education and Board examinations, and reciprocity among the different states; to seek better recognition for pharmacists in the Army and Navy of the United States. All of these are lines of endeavor worthy of the effort of this Section and would tend to elevate pharmacy. And let us not forget to secure new members for the Association. That is a duty we have always with us.

But there is one line of work I wish to emphasize and it is particularly appropriate to do this, when so many young men are being called to leave their work and women must take their places. Pharmacy is a profession well fitted for women and the members of this Section would do well to stress that fact and try to induce young women, seeking work along professional lines, to adopt it. On all sides pharmacists are calling for clerks and surely young women who are prepared may secure positions if they so desire. There will be an increasing demand for pharmacists in hospital and Red Cross work. Pharmacy is a profession demanding special training, not a business which may be acquired in the office or at the counter. So many young women should this year begin their college work. This is in line with President Wilson's suggestion that all young men and women continue their professional training, that they may be ready when the call of duty comes.

Before closing there is one message I want to give you, even though it is not connected with pharmacy. I would like to give it to every group of intelligent women in the country, regardless of the circumstances which bring them together. I can not reach all women but I can reach you and I ask you to pass the message on. It grows out of the awful conditions in which the world finds itself to-day.

Broadly speaking it is only within a few decades, that women have begun to be educated or to think for themselves. Before that they accepted the dictum of the ages as to the conditions of life, as to what was right or necessary. They accepted life as it was made for them and endured hardships and suffering as best they might. And now we find ourselves in the maelstrom of this awful war. Whatever degree of responsibility we may have, we can not now escape. "The only way out is straight through," as I heard one man say. We accept our duty to do everything to end it, as soon as possible, in the right way. We will give our boys to be soldiers and our girls to be nurses. We will sew and knit, economize and conserve the resources of the country. We will go on with life and endure the suffering and agony, but we rebel against it. Women all over this world to-day are in rebellion against war as they never were before.

We have always been told that war is necessary, even ennobling. To-day we are questioning those statements and we have about come to the conclusion that, unless a way can be found to get along without war, life is not worth living and the sooner the human race dies out the better. If when this war is over, there is nothing to do but get ready for another, why keep on bearing and rearing children; why try to discover the most healthful conditions for their life and the best form of education for them. It will only be used in devising more fiendish forms of torture for killing their fellow beings.

No, we must start out with a different thought, not that war is necessary and we must be prepared for it, but that there is a way to get along without war and we must find it. Now while we are in the midst of this awful struggle, we must do everything to help, but while we are working let us also be thinking that when the time comes, we may be ready to join with thinking women all over the world to put an end to war. Perhaps that is the reason we have been given these larger opportunities of education, experience and influence. "Who knoweth whether thou art come to the kingdom for such a time as this."

Complying with a motion by Miss Cooper, duly seconded and adopted,

Mrs. Beringer named Mrs. W. C. Anderson, Mrs. W. C. Bartholomew and Mrs. C. Blakeslee a committee on President's address, instructing the committee to report at the meeting Friday afternoon.

Greetings from the following officers and members who were unable to attend were read by the Secretary: First Vice-President, Mrs. E. G. Fine, Mrs. Elizabeth Kelly, Miss Bertha Ott and Mrs. Mary E. Apple, Treasurer.

The following committees were then appointed by the President:

Nominating Committee: Mrs. H. M. Whelpley, Chairman, Mrs. E. G. Eberle, Mrs. O. F. Claus, Mrs. E. W. May and Mrs. F. H. Carter.

Resolutions Committee: Mrs. W. L. Dewoody, Chairman, Mrs. Charles Holzhauser and Mrs. Alfred Husted.

The committees were instructed that reports should be ready for the Friday afternoon session.

The annual report of the Secretary was then read by Mrs. Kenaston:

SECRETARY'S REPORT.

Madam President, Officers and Members of the Women's Section of the American Pharmaceutical Association.—With a sincere sense of gratitude for the privilege of serving this organization, I herewith render an account of the stewardship which you have so generously bestowed upon me.

It is with the keenest appreciation of the confidence expressed by this body one year ago at the Atlantic City meeting, when you elected me Secretary of the Section, that I submit to you the following statement of the duties performed during the year.

All requests for assistance in gathering the necessary materials and data for the publication of the minutes of the Atlantic City meeting, sent by the editor of the American Pharmaceutical Association JOURNAL were promptly complied with. We are indebted to the editor of the JOURNAL for special efforts to publish the minutes in an attractive manner also for the excellent page of photographs of the elected officers. Pursuant to the recommendation of President Mrs. G. D. Timmons, reprints were ordered, amounting to two hundred copies, from the February 1917 issue of the JOURNAL at a cost of \$10.90, which amount includes express on same. Copy of bills for same is herewith presented and made a part of this report. Packages containing a number of copies of the reprints were mailed from the Secretary's office to the chairman of each committee with a letter advising that more were available if desired. Not any requests for additional copies have been received.

At the Atlantic City meeting your Secretary was instructed to issue a letter advising members of the American Pharmaceutical Association that the women of their families thereby were eligible to membership in the Women's Section. This request was complied with and with the kind cooperation of your President and the generous courtesy of the Treasurer of the American Pharmaceutical Association, a form letter was sent out from the Secretary's office and also as an enclosure with the receipts from the Treasurer's office to all members of the Association. This letter was processed upon the letterheads furnished to the Secretary of the Women's Section, copy of which is herewith presented.

The results of this work and the experience gained leads your Secretary to conclude that it was a worth while effort though not followed by the number of replies that was expected. I would further express the opinion that should it be the pleasure of this meeting to direct that a similar plan be pursued the coming year, more definite results may be apparent and the enthusiasm gained during 1916-17 through this procedure will not be lost but rather multiplied as this and future years advance.

Copy for letterheads and envelopes were furnished printers and order placed as per attached receipted bills, amounting in all to \$18.54, with the additional cost for express of \$0.88, making a total of \$19.42. This stationery was distributed to the elected officers and chairmen of committees. From letters received and the necessity of changing about in quantities to make the amounts meet the requirements of the various officers, I believe the amount ordered was practically the correct number that ordinarily would be used each year.

Your Secretary was also directed to write each newly elected member of the American Pharmaceutical Association advising the women members that by virtue of their membership

in the A. Ph. A. they also were members of the Women's Section. Letters were sent to those joining earlier in the year, extending the cordial and fraternal greetings of the Section and inviting their coöperation and assistance in the work of the Section. Letters were also sent to the newly elected men members as their names appeared in the Council letters printed in the *JOURNAL*, advising that the women of their families were entitled to membership in the Women's Section providing they may elect to be so recognized. Cordial fraternal greetings were extended together with an invitation directed to the women, to attend the next annual meeting and become active members in the Women's Section. The rush of business incident to the demands for time to be given on the altar of patriotism, prevented the continued issuing of the letters as mentioned above and for this reason not all new members were thus welcomed.

Correspondence with the secretaries of state boards of pharmacy with a view to collecting data regarding women pharmacists and the promotion of the objects of the Section in so far as we may be in a position to remedy existing unfavorable conditions relating to women in the profession, was also directed by the Atlantic City meeting. The series of letters addressed to the secretary of each of the several state boards of pharmacy brought replies from almost every state and no doubt those who have not reported at this date will do so in a short time. Many kindly advanced ideas for the improvement of the conditions now prevailing in the profession—the main thought resulting from the perusal of the letters is that we must have a campaign instituted, directed in such a manner that shorter hours will be conceded.

More especially should we plead for the sacredness of the Sabbath and relief from commercial duties for that day. Neither you or I could conscientiously encourage our own son or daughter to seek an education in a profession that bids fair to deny him or her the right to recognize the Divine command "Remember the Sabbath day to keep it holy" or do we wish to invite such influences as extended from our places of business. Will we assist in the influences that may speedily bring to us the acceptance by the public that the drug stores close their places of business at seasonable hours and on the Sabbath day?

A number of the replies called attention to the value of the education of young women to fill the positions made vacant by the young men who have responded to the call of our country and have patriotically enlisted in the cause of justice and freedom. The desirability of young women entering the profession could be made a proper subject for discussion and some means decided upon that would be effective in bringing this matter to the attention of the young women now of the age when selections are to be made that will decide their life-work. The data collected will prove of inestimable value to the Secretary's office in the event that it is the pleasure of this Section to further direct that the objects of our Section may be promoted and that we unite to study the conditions surrounding women in the profession with a view to increasing its value as a profession for women. The value of this investigation would be enhanced if further communication be directed to all registered women pharmacists during the coming year. The replies to the various communications could be made the basis for specific work; particularly would this be true if combined with the information gleaned from the secretaries of boards of pharmacy. We are justified in assuming that their extended experience would give us the correct ideas from which we may form conclusions as to what may be the greatest needs and supply that need so far as may be possible.

Inasmuch as South Dakota is the only state wherein legislation has been enacted providing that all registered pharmacists become active members of the State Pharmaceutical Association immediately upon successfully complying with the law governing registration and remain active members during the time their certificate of registration is in force, and your secretary is a member of that Association with the printed records of same at hand for reference, but little additional information could be secured by addressing the secretaries of the various state associations.

The letters addressed to the deans of Colleges of Pharmacy and other colleges maintaining a Department of Pharmacy met with the most generous, prompt and complete replies—lists of graduates with their present addresses, professional positions, etc., were received by this office and are now on file for such use as the Section may direct. Many added suggestions for advancement of the profession, all such suggestions, we have the right to assume, are the result of long years of thought and experience and hence should be regarded as practical.

All the correspondence resulting from the above communications is on file in this office,

also lists of the names of registered women pharmacists prepared in card index form and furnished the present Secretary by your former Secretary, Miss Anna Bagley.

The various journals devoted to the interests of pharmacy have commented editorially from time to time throughout the year on the continued efforts of the Women's Section. We trust this courtesy on the part of the editors will result in the favorable publicity desired by the Women's Section and that our aim to advance the interests of the parent organization together with the special purposes of the Women's Section may be a future development.

Following the direction of your President, the office of the Secretary furnished announcements of the coming meeting of the Women's Section for the July issue of eight pharmaceutical journals throughout United States and also in Canada, directing to the different localities so far as practical; all journals generously gave their valuable space to the announcement as furnished. Tentative programs for this meeting were furnished direct to the A. Ph. A. JOURNAL for the August issue by the Chairman of the Executive Committee.

I have written 3,814 letters and 170 post-cards, in conducting the necessary work of the office. Sometimes the answers to your letters may have been slow in reaching you because of absence from home, but I have replied to every letter received.

Fraternally submitted,

JEAN MCKEE KENASTON, *Secretary*.

The motion prevailed that the Secretary's report be accepted and that same be referred to the committee on addresses.

The Treasurer, Mrs. Franklin M. Apple, submitted a written report, showing the sum of \$9.00 in her hands.

The motion prevailed that the Treasurer's report be accepted and placed on file.

A paper by Mrs. W. B. Philip, entitled "Problems in the Druggist's Home," was read by Mrs. C. A. Dye. (To be printed.)

Very interesting discussions upon this paper were offered by Mrs. Timmons, Mrs. Dewoody and Mrs. Thatcher. Many interesting features and helpful thoughts were advanced which were at once greatly enjoyed.

Miss Zada M. Cooper read a paper upon the subject "Teaching the Public" (see p. 177, February issue).

Excellent discussion of the subject was opened by Mrs. Godding, followed by Mrs. Timmons and others.

Dr. F. J. Wulling, President of the A. Ph. A., honored the Women's Section by a personal visit at which time he addressed the meeting as follows:

REMARKS OF PRESIDENT F. J. WULLING.

I have ventured into your session to bring you the personal endorsement of the President of the Association and to give evidence of my interest in your work.

I will speak only briefly because I will be due in another section presently. My purpose is merely to encourage you with what little my endorsement of your work would mean to you. The Association is very grateful for your cooperation. As Mrs. Godding has just said, there is a distinct place for women in pharmacy. The influence that they may exert upon pharmacy may be otherwise than purely pharmaceutical. There is the refining and affirmative influence upon the men pharmacists of the happy-home makers and of the sweethearts and of the sisters. Then there is the active participation in the profession, and in that respect the women are increasing their contributions toward the sum total of pharmaceutical development and progress, and for that we men are very grateful.

As I have tried to point out a number of times at this convention, we are really in a critical period, pharmacy in America is in a critical period. Possibly I look upon the matter more seriously than others do because I have put a good deal of study upon it and have endeavored to find remedies. I see many difficulties that before were not apparent to me. We must think of remedies and I have suggested a few. Besides remedies we need help and the kind of help that comes from the women in pharmacy is of the affirmative kind, the uplifting kind. The women in pharmacy create, wherever they are, a splendid atmosphere and environment; they elevate the

surroundings by their presence. Aside from that, they have shown that they have real capacity for professional pharmaceutical service.

I am a teacher and as such help train young women in pharmacy and know how splendidly they take hold of the work and how conscientiously they work. I do not want to make a comparison that would be unfair, but I can say consistently the young women students are as a rule more earnestly devoted to study than the young men are. The young men tell me they have greater interests, wider circles of activities, and a good many other reasons for their lesser application.

There was a time when women pharmacists were looked down upon. I remember that time very distinctly when it was generally held that women had no business anywhere than in the home. Those times are past. Men have come to recognize that women have made places for themselves elsewhere as well as in the home. I feel, as I think you all do, that woman's first place is in the home, but there are other places as well for her. You have chosen a very good other place. I am one of those who claim that women can be in both places. You here assembled and your absent associates of the Section are doing a very splendid work, and as President of the Association and personally, I congratulate you upon the fine work you are doing in the Association and out of the Association.

The President extended the thanks of the Section to Dr. Wulling for the courtesy which he had extended, also for the kind words of encouragement and commendation for women in pharmacy.

The President then asked for reports of committees.

Mrs. John Culley, chairman of the Outlook Committee, was not present but submitted the report of the committee which was read by the Secretary.

REPORT OF THE OUTLOOK COMMITTEE.

Madam Chairman and Members Women's Section, A. Ph. A.—The chairman of the Outlook Committee has the pleasure to report that during the past year communications were addressed to each member of the committee and to others interested asking for suggestions that would be of benefit to the future welfare of the Women's Section.

A number of replies were received with various suggestions. One that may be of great value came from Mrs. Claire Albert Dye in which she reports that the women of Columbus, Ohio, interested in pharmacy, have organized a Women's Pharmacy Club for the purpose of uniting more closely their families in a social and business way. If the example set by the women of Columbus could be carried out by the women of other cities and amplified in state associations, then the women of pharmacy would come nearer understanding the aims and objects of the Women's Section of the A. Ph. A. as set forth in our constitution and outlined in the bulletin sent out by President Ruddiman, date of January 22, 1917.

Each year brings us nearer the accomplishment of the task of uniting the women of pharmacy. The outlook for the coming year seems to forecast more and more responsibility for women in all walks of life and to the women of pharmacy in particular will be afforded many opportunities to enter actively into business thereby serving themselves as well as their country.

Your Outlook Committee can make no better recommendation for the coming year than that the information conveyed in President Ruddiman's bulletin be placed annually before every woman who is eligible to membership in this section.

Respectfully submitted,

ELIZABETH CULLEY, *Chairman.*

Upon motion of Mrs. Charles Holzhauer, duly seconded, the report of the Outlook Committee was received and placed on file. The motion offered by Miss Cooper and seconded by Mrs. Timmons prevailed, that the recommendation included in Mrs. Culley's report relative to letters to be sent new members, shall be followed during the present year. The Secretary was instructed to continue the letters as in the past year; similar to the letters issued by the Section during 1916-17.

Miss Anna Bagley, General Chairman of the Membership Committee, not

being present, submitted the report for members in the A. Ph. A. which was read by the Secretary.

REPORT OF MEMBERSHIP WORK.

Your Chairman sent out 200 letters to the list of names in the file, these being selected as to territory within a reasonable radius of Indianapolis.

The result was three memberships and a number of letters returned unclaimed. The new members thus secured are: Miss Julia Emanuel, Fort Wayne, Ind., who owns and operates her own store; Miss Leafy A. Sauer, Pittsburgh, Pa., pharmacist at the City Hospital; Miss Alma F. Berhkersman, Cleveland, a practicing pharmacist.

In addition Mrs. Timmons secured two members for which our Section gets credit, making a total of five members.

The letters returned will be used to correct the files and a duplicate of the correction furnished the Secretary for her files.

In addition the Chairman wrote quite a number of personal letters in regard to membership.

While this is not a very flattering report, it has enabled the Women's Section to pay its own way again, as our appropriation from the A. Ph. A. was but \$25.00.

It is suggested that if these three women members are in attendance, they be specially welcomed to the Section. The expense of the letters was taken care of by the General Membership Committee.

Respectfully submitted,

ANNA G. BAGLEY, *Chairman*

Miss Zada Cooper moved the adoption of this report which was duly seconded and carried.

Mrs. G. D. Timmons, chairman of the Executive Committee, reported as follows:

REPORT OF EXECUTIVE COMMITTEE.

Madam President and Members of the Women's Section of the American Pharmaceutical Association.—

The Executive Committee believe that a detailed report would not be necessary or even desired at this time. We therefore respectfully submit the following:

During the year we have endeavored to interest ourselves in a general way in the activities of our Section—keeping in touch with the work of the officers as well as with the work of the various committees.

In view of the fact that the demands on women's time are greater than ever before it is gratifying to note the gradual increase in the activities of the Women's Section.

Approximately 150 personal letters were written and a reply received in every case where a reply was at all necessary, with possibly one exception.

The principal endeavor of our committee centered around the program. Valuable assistance was rendered by the former chairman of this committee, Miss Cooper, and by Miss Bagley, the former Secretary. The present efficient officers have also been very helpful in this work.

To all who have had any part in the preparation of the program we wish to express our appreciation.

[Signed] ADELINE GODDING,
CLARISSA ROEHR,
CECELIA M. TIMMONS, *Chairman*.

Mrs. H. M. Whelpley moved the adoption of the report, which was duly seconded and carried.

Mrs. J. G. Godding proposed that the Section send a letter of greeting to Miss Anna G. Bagley, the former Secretary, expressing regret because of her absence. To this the meeting most cordially assented.

Mrs. Godding spoke in part as follows: We cannot be too grateful that we had brought to us the most efficient Secretary who is now with us, and we hope she will long continue. But for one who stood in the first days of this Section, who realizes as no one else, perhaps, can quite realize, what Miss Bagley was to

us then in those days. After we had been invited to become a Section we met with obstacles and difficulties and Miss Bagley, although occupied in a very prominent position, and obliged to give much time to her own duties, did such great work for this Section, I feel that we should not forget her, and I move that we send a most cordial letter of greeting to her and that, further, we express our deep regret that she is not able to be present with us.

Mrs. Godding's motion was duly seconded and carried. The Secretary was instructed to write above letter.

Two of the former Presidents of the A. Ph. A. having been called by death, it was the sense of the meeting that letters be written the members of the bereaved families, expressing the sympathy of the Section. The motion of Mrs. Whelpley, duly seconded, prevailed and the Secretary was instructed to convey to Miss Diehl, daughter of ex-President Diehl, the kind interest and sincere sympathy of the Women's Section. Further that similar letters be sent to Miss Alpers and Mrs. Alpers, daughter and the widow of ex-President Alpers.

Upon motion duly made, seconded and carried, the first session adjourned as a business meeting until Friday, the program for the interval to consist of a series of entertainments provided by the hostess city.

SOME MEMBERS OF THE OFFICIAL FAMILY OF THE WOMEN'S SECTION, A. PH. A.—Upper row, left to right: Miss Zada M. Cooper, *President*; Mrs. Jean M'Kee Kenaston, *Secretary-Treasurer*; Mrs. E. A. Ruddiman, *Retiring President and Member of Executive Committee*; lower row, left to right: Miss Anna G. Bagley, *Chairman Membership Committee*; Mrs. Geo. D. Timmons, *Member of Executive Committee*; Mrs. John Culley, *Chairman Outlook Committee*.

ENTERTAINMENT FEATURES.

Wednesday afternoon the members of the Women's Section were tendered a most delightful entertainment when the musical program arranged for their pleasure was given in the Louis IV parlors of the Claypool Hotel; Mrs. Spencer and Mr. Taylor each gave several most pleasing numbers—their voices are rare and selections of songs excellent. Mr. Coppock gave several splendid piano selections all of which were greatly enjoyed.

Following the musical program, a very enjoyable reception was given the guests of the afternoon with the Indianapolis ladies as hostesses.

Thursday, August 30, the members of the Section were the guests of the local people and were taken for a long auto ride including many places of interest and beauty in and near the city, the automobile party leaving the Claypool Hotel at 9.00 A.M. and returning in time for the ladies to be in readiness for an elaborate luncheon at which they were the guests of the local organizations. Lunch was served in the Florentine Room of the Claypool Hotel at 1.00 P.M. The room was beautifully decorated in summer decorations and every feature was most pleasing.

Thursday evening, August 30, in common with all members of the A. Ph. A., the members of the Women's Section were the guests of Messrs. Eli Lilly and Company at their Pharmaceutical Laboratories. Automobiles were provided for conveying them to and from the laboratories. While at the plant the visitors were conducted through the entire buildings and factories, which, by special arrangement, were operating throughout. Guides accompanied the visitors and gave careful and complete explanations of each step in the various lines of manufacturing of interest to the pharmacists. After making the rounds of sight-seeing, delicious refreshments were served. Music was provided as a further feature of entertainment.

MINUTES OF SECOND SESSION.

The second business session of the Women's Section of the American Pharmaceutical Association was called to order by the President, Mrs. E. A. Ruddiman, at 2.00 P.M., Friday, August 31, 1917.

Mr. Taylor entertained the meeting with two selections. He sang "Stars of the Desert," by Woodford-Finden, and "You Are All That Is Lovely."

Dr. C. B. Jordan of the Purdue University addressed the Section as follows:

REMARKS OF C. B. JORDAN.

Madam President, I have wondered why the ladies were so enthusiastic about their meetings. I can see one reason. You always have music; but I do want to say that is not the only thing that makes the ladies enthusiastic. Mrs. Jordan is very enthusiastic about it.

Early in May, I believe it was, one of my girls came to me and said, "We would like very much to be acquainted with the girls in the other universities who are taking pharmacy and we would like to be acquainted with the ladies who have graduated from the Purdue School of Pharmacy, and they have started an organization somewhere in the West, in one of the California colleges, to bring about a movement whereby the ladies in schools of pharmacy and the ladies who have graduated from schools of pharmacy can get together and become better acquainted." I said I thought that very fine and we looked over our list of alumni. We were surprised to find that fifteen women had graduated in pharmacy from Purdue. The girls began to write to them telling them what they wanted to do, that they wanted to become better acquainted with the women who had taken pharmacy. There naturally is, you see, a bond of sympathy there, and it is especially true at Purdue because all the other ladies in the college are acquainted with each other and take an active interest in each other's work, but it is pretty difficult for those who are taking pharmacy. I said, "Now that you have started that, I think it is a fine thing, and it seems to me that the Women's Section of the A. Ph. A. would be the proper organization to mother such a movement." And that explains my presence here this afternoon.

When I go back, my girls are going to ask me if anything has been done about it, and what they can do and what steps they can take to become better acquainted with those interested in pharmacy, and I am in hopes that this organization will take some steps to bring about a closer union for the young ladies who are taking and who have taken pharmacy. I do not know whether there should be a sorority or some other organization to bring about that end, which to me seems very desirable. I know it will take some time to study this out. You can't do it at once; but I

do hope that this organization will at least take some steps toward a solution of the problem, if you think it is desirable. Perhaps it might be well to appoint a committee to study the matter for a year. I know it would please the ladies who are taking work at Purdue if such a committee was appointed by this organization. I would like to know what the members think about this. I thank you very much for the opportunity to speak to you.

Mrs. Ruddiman thanked Dr. Jordan for the timely suggestions and inquired the pleasure of the meeting, relative to the matters as presented by him. After discussion by several of the members present, the motion of Mrs. Whelpley prevailed that the Chairman appoint a committee to take the matter under advisement and report at some future date.

The President named the committee to consist of the incoming officers and Executive Committee of the Section; this committee to work along the lines as suggested by Dr. Jordan in his address and report to be made at the 1918 meeting of the Section.

Miss Bertha Ott, who was not present, submitted a paper that was read by Miss Florence F. Koch, the paper being entitled, "Some Social Service Aspects of the Hospital." (See p. 820, September issue.)

Discussion of the paper was opened by Mrs. Dewoody, who said in part:

"He who serves best his fellow man,
Is serving God the holiest way he can."

Mrs. Timmons then stated that we have with us as our Secretary, Mrs. H. R. Kenaston, the President of the South Dakota Congress of Mothers and Parent-Teachers' Associations and will call upon her for remarks along the lines of this paper that are included in the purposes of that organization.

Mrs. Kenaston spoke in part as follows:

The work of the Parent-Teachers' Association as it may apply to the work called for in this paper would probably refer to the very earliest work that is given under the direction of the Parent-Teachers' Association. It is carrying on hygiene in the public schools. Their first duty is to talk with the young people, and with the expectant mother, so that the early seeds of life may be properly protected and reared to the highest possible degree of physical, mental and moral fitness to occupy this earth. Everything for the care, for the first three years of the young child, is under the direction of the Child Hygiene Circle, where the child is given practical attention until it becomes of "kindergarten" age. The mother is taken into the Parent-Teachers' Association rooms where the lectures are given for their mental development along the lines of the various requirements of the child. The little one, if the mother cares to have it so, is kept under the care of a trained nurse in an adjoining room, so the mother is free to attend the meetings and need not fear that the baby will disturb the meeting. Later the child is cared for by the Kindergarten Department of the Parent-Teachers' Association, and in the larger schools this plan is worked in connection with the provisions of the local school boards. Later in life the training of the child is continued and the first thought is always for the physical, moral and intellectual welfare of your boy and my boy, your girl and my girl. It is hoped through this channel that the better humanity may exist in the generations to come. We can't do much for the present. It is the future that the Parent-Teachers' Association has planned to look out for.

Mrs. H. M. Whelpley entertained the meeting by giving a reading; the beautiful story preceding the reading was given in the following words:

The little poem I wish to give you was written by a graduate of the Alton High School. She resides with her aunt in the Godfrey homestead at Godfrey, Illinois. Many of you may know that Captain Godfrey was the founder of the oldest existing female seminary in the United States. It was the second one to be founded, but the other one went out of existence. This one now exists, and is in, I think, more prosperous circumstances than ever before.

In this poem of thirty-six stanzas she commemorates the Indian Legend of Lover's Leap and also the Reverend Mr. Lovejoy who was, in 1826, a teacher and Presbyterian minister in St. Louis. He afterwards became editor of a religious paper called *The Observer*. Although not

of a band of Abolitionists, he was strongly in sympathy with them. In 1836, when a negro was taken from the jail and tied to a tree and burned to death, the judge instructed the jury that if the mob were impelled by a metaphysical, or mysterious frenzy they should be absolved from guilt. Lovejoy's pictures in the case led to the destruction of the office of *The Observer*. He then left St. Louis and went to Alton, but his press was destroyed before it reached Alton. He was reimbursed by some of the citizens, but that press was also destroyed. Another one was purchased, and that was destroyed and thrown into the Mississippi River. The citizens of Upper Alton then held a convention and decided in the name of liberty and freedom of the press that the office of *The Observer* should be allowed to continue in Alton. Another press was purchased, and that was not taken to the office, but was stored in a warehouse, where it was guarded by Lovejoy and some twelve or fifteen friends. At midnight the warehouse was attacked by a mob, the windows broken in, and fire set to the building. Lovejoy went out to defend the press, was shot and died almost instantly. A monument now commemorates this sacrifice to liberty.

Miss Mary Creighton prepared a paper, which was read by Mrs. May (Miss Creighton not being present), entitled, "Chemistry of the Household" (see p. 179, February issue).

Dr. H. V. Army addressed the meeting as follows:

Madam President and Ladies of the Women's Section.—Permit me first of all to thank you ladies for the great courtesy of asking me to come to speak to you on the Metric System. It is indeed a great privilege to be invited to address you.

Secondly, I wish to bring a personal word of greeting to the ladies of the Women's Section from my sister, Elizabeth Godbold, of New Orleans. I want to explain at this time, although it seems rather late, the tremendous appreciation she felt at the honor you conferred upon her at the San Francisco meeting by choosing her as the honorary President of the Section. I would not bring this up now, except that through some misunderstanding the letter of appreciation she sent to Miss Bagley last year was not read at Atlantic City and I want to tell you how grateful my dear sister Elizabeth is to the Women's Section.

THE METRIC SYSTEM IN THE HOUSEHOLD.

I am going to discuss with you the metric system and that from the broadest standpoint. There is a good deal of talk now in regard to dropping our archaic system of weights and measures and taking up the metric system, and what I want to talk about to-day, to you who are representatives of such a large number of women's clubs throughout the entire country, is whether I can not persuade you ladies to give talks and read papers before your respective women's clubs, on this subject of the metric system.

We have started the American Metric Association in order to begin a campaign of education. We want to educate the people of the United States to the fact that we are wasting millions of hours of time and millions of dollars by using the old system. I have a theory that practically all standards, until the metric system was adopted, were chosen primarily ages ago to fool the purchaser, making it as difficult as possible for the purchaser to understand what he was buying or how much he was getting. For instance, flour is never sold by the pound. You buy flour for \$2.10 for the bag of 24½ pounds. Who is going to calculate the price per pound? There is the difficulty. You have got to get down to a long division to calculate. The metric system will reduce this unnecessarily complex calculation, since the system is based entirely on units of ten. If you want to calculate you would simply divide by ten. If a certain thing calls for a meter, for example, say 36 or 40 cents a meter in length, then, if you want to buy a tenth of a meter it would be one-tenth of the amount, and that is one of the great advantages of the metric system.

At the meeting at which the American Metric Association was organized, we had the great pleasure of hearing Madame Montessori speak on the subject, and there was present at that meeting also the greatest anti-metric advocate in the country, a man connected with the machinery trades, and it was very interesting for this man, who has written that the metric system was so complex that nobody could understand it, to hear Madame Montessori call attention to the fact that the blocks with which she taught arithmetic to children three years old, were based on metric units.

I have here a little ruler representing the tenth of a meter, which is a forty-millionth part of the earth's circumference around the poles. In other words, if you are going to make a tour of the earth around the poles you have to walk 400 million times this space here. It is about the width of a hand. To encircle the world, it would require 400 million hands side by side.

The standard of the metric system is this meter stick, which I now show. This meter stick is nothing in the world but a yard stick, which is a little bit elongated. In other words, instead of being 36 inches, it is a trifle over 39 inches long. It was devised by surveyors and accurately measured to the standards we speak of, so that in case the original standard ever got lost, it can be replaced by the same measure by which the original was made.

This meter stick is divided into red and blue tenths, the latter being identical with the metallic rule I first showed. Even as we talk about the dime as the tenth of a dollar, so this is called the decimeter as representing the tenth of a meter. We find in turn this is divided into tenths, such a tenth being called the centimeter or one-hundredth of a meter. And finally it is divided into an exceedingly small division called the millimeter.

The meter is, of course, of comparatively little importance to us in pharmacy, although of course, it is of vast importance in so far as you ladies are concerned in purchasing cloth. As the meter is about a yard and a tenth, a meter of cloth should cost about ten percent more than the yard.

The Montessori blocks which I now show make a pyramid of ten and of these the bottom one is a tenth of a meter (or ten centimeters) in length, breadth and thickness. The next one is nine centimeters, the next one is eight centimeters, the next seven, the next six and the next five, and finally the very small one at the top represents one centimeter.

The largest block, the cube of a decimeter is called the cubic decimeter and is one of the standards of volume of the metric system. If we had a box of this size filled with water, we would have 33 ounces, or a trifle over a quart. This smallest block, the cube of a centimeter, is called the cubic centimeter, which is the second unit of volume. A cubic decimeter (or liter) represents 1000 cubic centimeters. The liter is the common unit of volume, being slightly over a quart. The cubic centimeter, on the other hand, is about one-fifth of a teaspoonful. If we have this liter measure filled with water, the weight of that liquid under standard conditions represents the standard of metric weight. The weight of a liter of water is called a kilogramme and represents 1000 grammes, or slightly over two pounds. The weight of water having the volume of this small cubic centimeter block is called the gramme and the ratio of these two units, gramme and kilogramme, is one to one thousand.

The foregoing statements show how exceedingly simple is the relation of metric units to each other. Another advantage is that in the metric system, there is a definite relation between length, volume and weight. Just think of our old system of weights and measures! What relation is there between a gallon and a pound, or what is the relation between a gallon of water and a mile? Could you talk about a mile of water? Of course, you could calculate, and if you took days to figure it out, you could finally, I suppose, arrive at the ratio to a certain extent.

Having pointed out the advantages of the metric system over our present system of weights and measures, let us next discuss how are we going to bring it into general use in this country? Among the most enthusiastic supporters of the metric system are the canners and the wholesale grocers. One of the most active men in organizing the Metric Association was Mr. Drake of the National Wholesale Grocers' Association, and I want to point out that he has started to educate the public in a very practical way. I presume you all know that under the Food and Drug Law, every package of goods that is a definite staple, like canned goods, has to bear upon the package the weight or volume of material actually sold. The idea of this law is to prevent a package of—let us say vanilla extract—that really holds two ounces from being considered by the purchaser as a four-ounce bottle. What Mr. Drake and a large number of canners are doing is to put on their packages not merely the weight in ounces, but also the metric equivalent, so as to gradually educate the public to the relation between grammes, which is the standard metric weight, and pounds and ounces.

I might point out, as I have already explained, that a thousand grammes is about two pounds, and therefore a pound is about 500 grammes, or, more strictly speaking, it is 453 grammes; but the idea is to educate the general public to the use of this system in a practical way. I am

going to emphasize what I have already told you, that from experience of my own in Germany I found that in the course of a couple of months of actual work with it you will find you think in terms of the metric system and when you once do that, then the rest is much simpler than our present weights and measures where we have to divide by 16 or 12, or $437\frac{1}{2}$. For, as I have just said, in the metric system we divide by tens all the way through.

This is no academic statement. At this time there are 437 million people of the 1,600 million people in the world, using the metric system. France, Germany, Italy, and, as a matter of fact, all the civilized countries except the United States and England, are using the metric system.

Where does the opposition to the adoption of the metric system in this country come in? It is chiefly due to the machinery manufacturers who argue that the screws and threads of their machines are cut in terms of the old-fashioned system and that to make the change from old-fashioned to metric units will mean considerable expense. This may be true, but when you live in a town where the street numbers are changed there is expense of changing the street numbers, and we must persuade our brothers of that type that they must make some sacrifice in order to get the metric system going.

I will merely mention in conclusion that I am not here as a solicitor. I merely want to say that the object of the American Metric Association, which was founded last year, is to disseminate knowledge concerning metrics and I will add that we are getting out a lot of very interesting information concerning the subject. If any of the ladies would like to become members, I want to say that information as to membership will be gladly furnished. We want also to get up a children's membership of say fifty cents a year, or even twenty-five cents, to get the youngsters interested. We want to give them these little foot rules and other souvenirs.

In closing, I want to say what I said in the beginning, I do hope you ladies will talk on the subject of the metric system before the women's clubs, and I want to say if anyone wants to write a paper on the metric system for some women's club, I would count it a great privilege to be of some assistance in helping you prepare such a paper.

A vote of thanks was tendered Dr. Arny for his interesting address.

The Committee on Resolutions, by the Chairman, Mrs. Dewoody, offered the report as follows:

RESOLUTIONS.

We, the Women's Section now in session with the A. Ph. A., have had a most enjoyable time, pleasure, profit and inspiration derived from our association and visit that will prove of lasting benefit and a source of happy recollection, and

We do fully realize the care and thought that has been expended upon us and the many things that have been done to complete the sum total of a perfectly good time, and therefore

Be it *Resolved*, That we extend to the local ladies our heartfelt thanks for their unstinted and constant attention to us. We thank them for the delightful functions given for our pleasure, the musical, the automobile ride, the luncheon, all fill a happy place, but above and beyond all this we thank them for the heart-to-heart attitude that has shown forth in the glad hand shake, the sympathetic smile and constant alertness to show us a kindness.

We do earnestly thank Mr. Taylor, Mr. Spencer and Mr. Coppock for the splendid music they have rendered and that has added so much to the pleasure of our meetings. We extend thanks to the hotel management for courtesy and attention.

While it is a great joy to meet and renew old friendships, it deepens our sorrow and regret that any should be missing. We mourn the absence of Mrs. Fletcher Howard detained through illness and bow in meek submission that death has taken from our ranks Mrs. Harry B. Mason and Mrs. W. L. Scoville.

Now may we in profound reverence thank the great and loving Father who makes possible these happy reunions—and may we remember,

"Destiny has made us brothers,

No one goes alone;

And what you put into the lives of others

Comes back to you, in your own."

MRS. W. L. DEWOODY,
MRS. ALFRED HUESTED,
MRS. CHAS. HOLZHAUER.

Upon motion of Mrs. C. A. Dye, duly seconded, the report was accepted. Report of the Committee on President's Address was given by Mrs. J. G. Godding as follows:

REPORT OF COMMITTEE ON PRESIDENT'S ADDRESS.

The Chairman who was appointed was unable to give this matter attention at the time and the Committee has asked me to report. It was only at a late hour that this came to me so that we have not been able to comment thereon as we would wish to do, but the Committee reports most favorably on this splendid address of the President. It is asked that each one study it carefully and ask your husband for the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, that you may watch for the time when the proceedings of these meetings shall be printed, and especially the number that will contain the President's Address. It is recommended that you give careful and earnest attention to the recommendations, and especially that one which speaks of women being so well fitted for pharmacy, and for each and every one of us to try to induce young women seeking work along professional lines to adopt pharmacy. Also, after we have given this careful attention and put in all the work we possibly can, do not forget her closing words, "of the time when this terrible struggle in the world shall be over that we women shall join together to put an end to War."

Mrs. H. M. Whelpley, Chairman of Committee on Nominations, reported the following:

President, Miss Zada M. Cooper, Iowa City, Iowa.

First Vice-President, Mrs. Wm. L. Dewoody, Pine Bluff, Arkansas.

Second Vice-President, Mrs. F. J. Wulling, Minneapolis, Minn.

Third Vice-President, Mrs. F. W. Meissner, La Porte, Indiana.

Secretary-Treasurer, Mrs. H. R. Kenaston, Bonesteel, S. Dakota.

Chairman Executive Committee, Mrs. C. A. Dye, Columbus, Ohio.

General Chairman Membership Committee, Miss Anna Bagley, Columbus, Ohio.

Respectfully submitted,

MRS. H. M. WHELPLEY, *Chairman*,

MRS. E. G. EBERLE,

MRS. O. F. CLAUS,

MRS. E. W. MAY,

MRS. F. H. CARTER.

Upon motion of Mrs. Godding, the report was accepted and the Secretary instructed to cast the ballot for the officers as nominated.

The Secretary announced that the ballot was cast as directed and the President declared the officers elected.

The officers were then installed by Mrs. Godding, who in well-chosen and happy words introduced the elect, vouching for their peculiar fitness for the respective positions to which they were chosen. Brief responses were made and the officers declared duly installed for the ensuing year.

The Secretary called the attention of the Section to the fact that a number of changes in the Constitution and By-Laws had been directed during the interval since same was adopted in 1913. During the year just closed, the Secretary had been directed to have Constitution and By-Laws printed in small booklet form. This could not be done because of necessary changes in wording, etc., to prepare a proper form. After discussion, on motion, duly seconded and carried, the President was asked to appoint a committee to prepare the Constitution and By-Laws and have same printed.

The incoming President and Secretary were named as the committee, namely, Miss Zada Cooper and Mrs. H. R. Kenaston.

In harmony with the spirit of the year, the closing of this meeting was completed by all joining in the song, "America."

(MRS. H. R.) JEAN M'KEE KENASTON, *Secretary*.

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Editor on the day following the meeting, if possible. Minutes should be typewritten, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

BALTIMORE.

The January meeting of the Baltimore Branch of the American Pharmaceutical Association was held in Harris Hall, University of Maryland, on January 16th, President McKinney presiding.

The reading of the minutes of the previous meeting was omitted.

John C. Muth gave a most interesting talk on the subject of "The Laws Applying to the Sale of Alcohol," presenting the recent rulings of the Internal Revenue Department in a very clear and concise manner. In his talk Mr. Muth pointed out that alcohol produced prior to September 9, 1917, is called Beverage Alcohol and can be sold without any restrictions other than those in force before the Food Control Act became operative; that alcohol produced since September 9, 1917, is called Non-Beverage Alcohol. That in making application to deal in Non-Beverage Alcohol the applicant must file a bond covering three times the number of proof-gallons of alcohol he may have on hand at any one time, at the rate of one dollar a gallon. Liberty Bonds covering the amount may be deposited with the Collector of Internal Revenue. These bonds will be kept in Washington, the coupons being mailed the holder as the interest accrues. A holder of a permit may not sell pure alcohol except to persons holding permits. To others, he may only sell alcohol after it has been medicated according to one of the ten formulas suggested by the Department and in quantities of not exceeding one pint. The medication may not be done in advance, but must be done at the time the order is received. Physicians' prescriptions may be compounded with alcohol provided it is so medicated as to render it absolutely unfit for use as a beverage, and the druggists are held responsible as to the sufficiency of the medication. Non-Beverage Alcohol may be used without restriction in the manufacture of U. S. P. or N. F.

preparations. When alcohol is used in making other preparations, the manufacturer must file with the Collector certain data, giving the name of the preparation, the percentage of alcohol it contains and a sworn statement that this amount is no more than is necessary for the purposes of solution and preservation; that it is not a beverage or to be used as a beverage. Violations of these and other rulings found in *Treasury Decisions No. 2576*, are punishable by a fine of five thousand dollars or two years imprisonment, or both.

At the close of his address, Mr. Muth was given a rising vote of thanks and the Secretary was instructed to mail an abstract of the address to each member of the Branch.

A letter from the Washington Branch A. Ph. A. suggesting that members of that Branch would like to attend the February meeting of this Branch, was read, and the Secretary was instructed to invite the Washington Branch to this meeting.

Dr. John F. Hancock paid tribute to the memory of Prof. Joseph P. Remington and Mr. Charles Holzhauser, and suggested that a committee be appointed to draft suitable resolutions on the death of these men. A committee consisting of Drs. J. F. Hancock, E. F. Kelly and H. P. Hynson was appointed and the following resolutions were presented and adopted:

Be it Resolved, First, That we learned of the death of Professor Joseph Price Remington with deep regret.

Resolved, That we deeply sympathize with his bereaved family in their great loss.

Resolved, That the Branch do now suspend their business in order to pay appropriate respect to the memory of the lamented deceased.

Resolved, That the Secretary communicate these resolutions to the family of the deceased.

Be it Resolved, First, That we learned with deep regret of the death of Mr. Charles Holz-

hauer, the beloved President of the American Pharmaceutical Association.

Resolved, That we deeply sympathize with his bereaved family in their great loss.

Resolved, That the Branch do now suspend other business in order to pay appropriate respect to the memory of the lamented deceased.

Resolved, That the Secretary communicate these resolutions to the family of the deceased.

The following officers were elected:

President, C. C. Neal.

Vice-President and Chairman of the Executive Committee, Miss E. Grace Lotz.

Secretary-Treasurer, Frontis Lentz.

Member of Council, E. F. Kelly.

Chairman of the Committee on Membership, Charles H. Ware.

Chairman of Committee on Professional Relations, C. L. Meyer.

Chairman of the Committee on the Science and Practice of Pharmacy, H. A. B. Dunning.

Chairman of the Committee on Education and Legislation, Charles Morgan.

F. LENTZ,

Secretary-Treasurer.

CHICAGO.

The ninety-third monthly meeting of the Chicago Branch was held Friday evening, January 25, 1918, at Kuntz-Remmlers Restaurant, with forty members and visitors in attendance.

After dispensing with the reading of the minutes, a verbal report was presented by President Craig, followed by the Secretary-Treasurer's report, which showed that of the 150 members of the Branch, 48 had been in attendance at Branch meetings during the year and that the membership now numbered 165. N. Gray Bartlett and J. F. Fischnar have been lost from membership by death. The Secretary pointed out the need for an increased income in 1918 and recommended the appointment of a budget committee.

Upon motion unanimously adopted, the Executive Committee was instructed to prepare a budget for the expenses of the Branch for 1918 and ways and means to finance it.

The Membership Committee, C. C. Orr, Chairman, reported 29 new members in 1917 and 3 this evening. C. A. Seuring, Frank Ahlborn and Geo. V. Haering.

Mr. Wells reported nothing from the Legislative Committee.

The Committee on Practice, I. A. Becker, Chairman, presented a most interesting report on conservation of sugar and glycerin in pharmacy:

CONSERVATION OF SUGAR AND GLYCERIN IN PHARMACY.

The scarcity of sugar and its importance as a food forced the pharmacists of Germany and its allies early in this war to conserve it to the utmost and to find substitutes wherever possible for pharmaceutical purposes.

The war demands for glycerin also soon caused a scarcity of the raw materials from which it is obtained, thus compelling, early, its limited use, and a search for substitutes.

In England this need was reflected in the action of the General Council of Medical Education, in suspending the several formulas containing glycerin or sugar, or both, from the British Pharmacopoeia, and publishing "War Emergency Formulas" to replace them.

The position of the United States, a general supply depot to the other warring nations, during the greater part of the war, has made the situation serious for us rather early after our joining in the war.

Therefore, it behooves us carefully to consider ways and means for minimizing our consumption of these articles, and their elimination, whenever possible, in preparations they enter.

This subject has been so ably treated in papers just published, or soon appearing, that I need only direct your attention to the more salient features of them, urging you to fully acquaint yourselves with their details at your earliest opportunity.

In a paper appearing in the February 1918 issue of the *Northwestern Druggist*, F. A. Upsher Smith, of St. Paul, treats this subject very ably, confining himself to the U. S. P. preparations: This to be followed by a paper on the N. F. glycerin and sugar-containing preparations.

Mr. Smith recommends a joint A. Ph. A. and N. A. R. D. committee to devise substitute formulas to be placed at the disposal of the U. S. P. Revision Committee, and their adoption urged.

He treats the U. S. P. preparations in what may be called a statistical manner, with recommendations.

Under the caption, "Pharmacy and the War," Editor Eberle, of the *A. Ph. A. JOURNAL*, refers to this subject, in part, thus further emphasizing its importance.

I would call your attention, especially, to the paper of Curt P. Wimmer, read before the New York Branch, December 1917 meeting and published in the January 1918 issue, A. PH. A. JOURNAL, page 39.

Mr. Wimmer made some very fundamental experiments and investigations preparatory to further elaboration of the subject. I wish here to add my hearty endorsement of the suggestions contained in this paper, and for the sake of emphasis, to quote his closing paragraph, as follows:

"Let us not wait until we are asked to do it, but let us be prepared," "In our national emergency don't let us be followers, let us be leaders for the country's good."

(Signed) I. A. BECKER,

Chairman Committee on Practice.

Many samples of galenicals in which glycerin or sugar usually are found, but now made without glycerin or sugar, were shown. These included Bashams' Mixture, *Syrupus Factitious* B. P., *Elixir Simplex*, etc.

A group of preparations, accepted as Official British Sugar and Glycerine Substitutes was prepared by B. L. Eicher, and shown to the members. These preparations consisted of: *Syrupus Factitious*, *Elixir Simplex*, *Glycerinum Acidi Carbolici*, *Glycerinum Acidi Tannici*, *Glycerinum Amyli*, *Glycerinum Boracis*, *Syrupus Aurantii*, *Syrupus Limonis* and *Syrupus Tolutani*. Of the whole group, the *Syrupus Factitious* and the *Elixir Simplex* seemed the most desirable, many expressing the thought that it was even a better preparation than our present official elixir with syrup and 25 percent alcohol. The *Syrupus Tolutani* was also considered first class, the chloroform present undoubtedly adding to its therapeutic value.

The sentiment was general that if the syrups of lemon and orange had been made from the fresh oils rather than the tinctures, the products would have been better. Samples of a syrup substitute using an Irish moss jelly were also shown and proved quite commendable, especially as a vehicle for wild cherry cough preparations.

Wm. Gray showed samples of several elixirs and syrups made without sugar or glycerine; particularly an elixir of terpin hydrate in which the chemical was kept in solution with an equivalent quantity of glacial acetic acid and neither glycerin nor alcohol were used in this elixir.

R. A. Whidden, speaking to the report, stated

that tragacanth gum is now very scarce and of poor quality, and its general use by druggists would soon consume the entire supply. He and Adolph Umenhofer strongly objected to the use of the term "substitute" in connection with pharmaceutical preparations. They held that substitution in connection with pharmacy was a term of reproach and ridicule in the public eye and that new and distinctive names should be adopted to designate preparations to be used in place of glycerin and syrup. I. M. Light advanced the argument that sugar and glycerin were not so scarce that their use in essential medicines should be discontinued while they were being extensively used in the manufacture of candy and soda syrups, toilet articles, etc.

President Craig stated that there was a real shortage of both sugar and glycerin, which shortage would become more acutely felt as war continued, but agreed that the use of these articles in the non-essentials should be restricted before the restriction of their use in medicines. He urged a trial of mucilages and a trace of alkali in toilet preparations in place of glycerin and of corn syrup with saccharin if necessary in soda syrups. He also said that in France solutions of certain salts were used in place of glycerin.

Professor W. B. Day: "While conditions to-day do not perhaps warrant the immediate introduction of sugar and glycerin substitutes for use in medicines, yet rapid changes may occur in the food situation and druggists may be suddenly shut off from adequate supplies of sugar and glycerin. We should be prepared to meet such changed conditions when they arise. Therefore I move that the U. S. P. and N. F. Revision Committees be requested to consider the question of the conservation of sugar and glycerin in official preparations against the possibility of a government request that pharmacists curtail the use of these substances in medicine."

This motion was seconded, and after further discussion was submitted to a vote and failed to carry. The report of the committee was adopted, however.

Thos. H. Potts was not present to report for the Publicity Committee, but President Craig pointed out the fine service that C. R. D. A. News had given us in announcing the meetings of the Branch, and Wm. Gray moved that the officers of the C. R. D. A. be given a rising vote of thanks. This vote was unanimous. The report of the Nominating Committee was presented as follows:

*Officers.**President*,^{*} Hugh Craig.*1st Vice-President*, A. H. Clark.*2nd Vice-President*, Mrs. A. S. Druehl.*3rd Vice-President*, E. Von Hermann.*Council Member*, Clyde M. Snow.*Secretary-Treasurer*, E. N. Gathercoal.*Committee Chairmen.**Membership*, W. B. Day.*Legislation*, S. C. Henry.*Practice*, I. A. Becker.*Medical Relations*, Dr. Bernard Fantus.*Publicity*, Thos. H. Potts.

S. C. Henry moved the substitution of the name of James H. Wells in place of S. C. Henry as chairman of the Legislative Committee and the Nominating Committee accepted the substitution. Upon motion of B. L. Eicher and seconded by I. M. Light, the report as amended was adopted and the Secretary was instructed to ballot for the nominees. The Secretary cast the ballot and the Chairman declared the nominees elected.

The Hon. Frank Freericks, of Cincinnati, was then introduced in the President's most eulogistic, yet sincere, manner. Mr. Freericks spoke on the Income and Excess Profits Tax. He distributed copies of Income Tax Return forms and used several charts. The address was given in Mr. Freericks' usual eloquent and yet very clear style and at its conclusion he answered many questions. The address was very warmly applauded and received with numerous expressions of thanks.

E. N. GATHERCOAL,
Secretary.

The ninety-fourth monthly meeting of the Chicago Branch was held Friday evening, February 22, 1918, at Kintz-Remmlers Restaurant with about 40 members and visitors in attendance.

P. S. Mandabach and J. S. Bellack were received as new members.

Following dinner, the meeting was called to order at 8.30, President Craig presiding.

The reading of the minutes was dispensed with and no routine business was brought before the meeting.

President Craig then introduced Dr. Edward Kremers, who read the paper of the evening, "The Revision of the United States Pharmacopoeia: a Retrospect and a Prospect." The speaker reviewed briefly the history of our national standard, pointing out that ours is one of the first of the national pharmacopoeial

standards. He dwelt, somewhat in detail, on the rejection by the A. M. A., in 1876, of Dr. Squibb's suggestion that this national medical body take over the responsibility of revision which had previously been assumed in large part by the editors of the U. S. Dispensatory. Indeed, for a long time, this was the national standard in fact, while the U. S. P. enjoyed the distinction in name only. He also showed how the work of the A. Ph. A. Committee proposed by Dr. Hoffmann and headed by Dr. Rice laid the foundation to the revision of 1880, which resulted in our modern standard.

The principal problems that confront us in the revision of the U. S. Pharmacopoeia are:

1. The question of financing the expert labor required; and, closely associated with this,
2. The frequency of revision; and lastly,
3. The question of representation of the interested professions.

With the call of the next decennial convention, the U. S. Pharmacopoeial revision will have completed its first century of history. The present tendency toward centralization of power in Washington is another reason why pharmacists should not leave the initiative of pharmacopoeial reform to others, least of all to a possible new department in our national government, in the organization of which they may not even have a voice.

Dr. Kremers stated that Government revision, for which abundant research was available, would be more authoritative and could, by a continuous process of revision, quickly eliminate errors and keep the work fully up to date. He suggested that the whole pharmacopoeia might well be printed on cards and that general revision at fixed periods be discontinued.

The discussion, which was very full, divided itself into two general trends—that which endorsed Dr. Kremers' views and that which found more or less objection to them.

Professor R. P. Fischel expressed the opinion that at present in any of the Government departments that could take charge of this revision, pharmacy would have no voice whatever, and it would not be advisable to turn over the revision until pharmacy had some official recognition by the Government.

PROFESSOR J. A. KOCH: We have a good U. S. P.; no better pharmacopoeia in the world, though many are government-revised. Can the Government better it? Will it be more prompt in giving the revisions? Our

past experience does not so indicate. If pharmacy relinquishes now her right to a prominent position in pharmacopoeial revision, she will never regain such position.

P. A. MANDABACH: The price of the Pharmacopoeia should be reduced. Sixty-seven percent of the drug stores are without a U. S. P., last revision, to-day.

PROFESSOR W. B. DAY: Our Pharmacopoeia is the peer of any of the pharmacopoeias of the world. If pharmacy releases its control of revision, will she have any power in an advisory capacity? Advisory boards are usually helpless; their advice is often not acceptable to the "powers that be." Pharmacy's loss of the U. S. P. will certainly be taken advantage of by medicine and chemistry. But Government control is probably coming and Dr. Kremers has done a great service in presenting this matter to the Chicago Branch. Its consideration is timely. Let us build up pharmacy to a point where its recognition will be inevitable.

MR. S. C. HENRY: It is of the utmost importance that pharmacy should have oversight of pharmaceutical standards and if we need Government aid in the revision, we should initiate the movement, formulate our plans and present them in such an intelligent way that we could secure such assistance and research and still retain the hold of pharmacy in guiding and dictating the revision.

DR. H. M. GORDIN, in a very striking talk, upheld Dr. Kremers' ideas. He disagreed with the point made by Mr. Mandabach, saying that the reason 67 percent of the pharmacists had no pharmacopoeias was not because they couldn't spare the three dollars to buy one, but because they were not sufficiently interested in the book to do so. The retail pharmacist, with few exceptions, knows nothing of the pharmacopoeia and cares nothing for it. It is a public book of standards and could well be prepared by the Government.

PROFESSOR A. H. CLARK: Much is said about the control of the U. S. P. by the pharmacist and what the pharmacist wants in the U. S. P. After all, it is a question of public policy and the U. S. P. should be made in the interests of millions of people all over the country, and not in the interest of some few thousands of pharmacists. If the Government can best serve the interests of all, then it is surely the one to revise the U. S. P. The Government would probably delegate the work to a few men and it has been suggested that under these conditions, self-interested manufac-

turers, politicians, grafters, etc., would have a hand in it. I feel that there is no more danger of this than under the present system, where a goodly number of the active members of the Revision Committee are manufacturers, and others, who may be interested in various ways. What the U. S. P. needs above all else is continuous, systematic, thorough and efficient research work in order to bring the tests and standards to the highest degree of perfection. Much evidence is found in the various revisions of the book of the lack of this. I feel that the Government could prosecute such work much better than a committee such as we now have. The necessary funds do not seem to be forthcoming from any other source.

By special request, Dr. Fischelis reported on the work of the National Pharmaceutical Service Association.

The University of Illinois School of Pharmacy had on display a complete set of the U. S. P. from 1820 to date, also a set of *Digest of Criticisms* of the U. S. P. and N. F. and of the *Circulars* of the Revision Committee. The display was of much interest to those in attendance.

E. N. GATHERCOAL,
Secretary.

CINCINNATI.

Through error in misreading, in making a typewritten copy, in the office of the JOURNAL, the lecture by Dr. Zeumer, of Parke, Davis & Co., on "The Manufacture, Preparation and Uses of Antitoxins and Serums," before the Cincinnati Branch, A. Ph. A., January 8, 1918, was credited to Prof. Fennel. The report is printed on p. 184 of the February issue. Dr. E. P. Zeumer's name should have been given in this article wherever that of Prof. C. T. P. Fennel occurs.

DENVER.

PROF. JOSEPH P. REMINGTON: AN APPRECIATION.

BY SAMUEL T. HENSEL.

Before presenting the set of resolutions which I have had the honor of being appointed to prepare for the consideration of the Denver Branch of the American Pharmaceutical Association, respecting the death of Prof. Joseph P. Remington, I would ask your kind indulgence while I offer a brief appreciation of this distinguished man.

I do not undertake this as one authorized to speak by virtue of professional association, or through intimate knowledge of his life's work, extended over so many years, but rather as an alumnus of the Philadelphia College of Phar-

macy, the great institution over which he presided with such marked ability and success.

My recollection of Professor Remington carries me back to the days of my youth, when I sat at the feet, respectively, of Prof. John M. Maisch, the profound scholar and distinguished American botanist; of Prof. Edward Parrish, one of the most accomplished pharmacists of his day; and of Prof. Robert Bridges, the eminent physicist and chemist, the American editor of "Fowne's Chemistry," an English work well known to the pharmacists of that period.

The last year of my attendance at college, Professor Remington became an assistant to Professor Parrish, and stood, so to speak, upon the very threshold of his career.

When he first entered the classroom, the impression I received was that of a strikingly handsome, dignified and highly intellectual young man.

He immediately gained the admiration, confidence and love of the student body by reason of his kindly helpfulness and enthusiasm, qualities which he retained through life.

His interest in the future of graduates, who went forth into the world as alumni and representatives of their Alma Mater, was undiminished to the very last. This spirit breathed in every word he ever wrote to the members of the Alumni Association.

When in August 1912, the American Pharmaceutical Association held its annual meeting for the second time in the city of Denver, arrangements were immediately made for the mid-week meeting of the Alumni Association of the Philadelphia College of Pharmacy.

The meeting, held in the Magnolia Room of the Albany Hotel, was presided over by Professor Remington, as were nearly all pharmaceutical gatherings when "Remington," as the boys fondly called him, was available.

And there was a reason for this, for Professor Remington could always be depended upon to do the right thing in the right way and at the very nick of time.

The gathering on this occasion was a notable one, composed of a large number of the leading lights of the pharmaceutical world.

One by one these were called upon, and each speaker seemed to furnish added inspiration to his successor, the result being a series of the most beautiful tributes of respect.

Professor Sayre, of the University of Kansas, had just ceased speaking, and I had been carried back in memory to the days of my boyhood, when I was aroused from my reverie and almost stupefied, as I heard my name called; for Professor Remington had stated, a short time before, that owing to the large attendance it would be necessary to depart from the usual custom of calling upon every alumnus, therefore, he would confine himself to a few.

I rose in my place with no idea of what I was going to say, but as I stood up an incident of the classroom flashed across my mind, and I was thus saved from complete discomfiture and furnished with the introduction to my remarks.

I said that my embarrassment in being called upon was akin to that of Professor Parrish at the delivery of his lecture on "The Application of Heat to Pharmaceutical Processes."

He was describing the "Bunsen" burner, explaining its theory, construction and application. He showed wherein it differed from the ordinary gas jet. The "Bunsen" flame was non-luminous and intensely hot, while the ordinary gas jet was luminous. The luminosity of the gas jet was due to very minute particles of unconsumed carbon which, as they approached the heated zone of the flame, became incandescent, thereby causing light.

In the case of the Bunsen burner, its construction is so arranged as to provide for the admission of a large body of air, four-fifths of which is known to be oxygen; this in turn combines with the carbon of the gas immediately to form carbon monoxide, which is a non-luminous flame, representing all of the heat calories of the gas employed.

He went on to tell how it could be demonstrated that the luminosity of the gas jet was due to unconsumed carbon. If, said he, we rotate a plate over a flame, there will be immediately observed a deposit of carbon.

The similar rotation of a porcelain plate over the Bunsen burner results in no discoloration.

To demonstrate that the black deposit is carbon, he said that if we now rotate the blackened plate over the Bunsen burner, we shall find that the blackened surface will disappear. This is due, he explained, to the fact that the carbon on the plate combines with the oxygen of the air and burns from the porcelain surface.

DETROIT.

For some reason or other, whether from atmospheric influences, decomposition products, or the character of the gas coming from the burner, the experiment was not a success.

Professor Parrish was a most excellent talker and very resourceful. He kept rotating the plate over the non-luminous flame, turning it over to look at it from time to time, and discovering that it was a failure, he skillfully shifted his remarks, along with the plate, and began talking upon some related subject.

The boys who had followed his lucid description of the rationale of what was to have been a striking experiment, stood the strain for a few minutes longer and then broke into a simultaneous roar of laughter. Professor Parrish, after a moment of evident embarrassment, in his most charming manner, smilingly said: "Well, for some reason the demonstration is not a success to-day, but it can be done, under proper conditions."

After I had finished the recital of this incident of the classroom, Professor Remington rose and in his irresistibly humorous vein said: "Well, we've got it on the boys now. Whenever we give that lecture we provide ourselves with two plates, one with the carbon deposit, and the other blank; by skilful manipulation, the experiment never fails."

When we come to consider the activities of Joseph P. Remington as Ex-President of the American Pharmaceutical Association, Ex-Chairman of the Council of that body, Chairman of the Committee of Revision of the United States Pharmacopoeia, Editor of the United States Dispensatory, Author of the famous "Theory and Practice of Pharmacy," Dean of the Philadelphia College of Pharmacy, we get an insight into the working capacity of a great man.

His labors as Chairman, Editor, Author and Dean of a great educational institution alone represents a prodigious amount of work, which could have been accomplished only by the exercise of the most careful, orderly and systematized methods.

The magnitude of this work did not permit him to wait for the inspiration of the divine afflatus. "Duty" stood ever at his elbow, urging him on to the achievement of a life-work that must ever remain as an example of the highest order of well-directed effort, which will be held in grateful remembrance not only by his contemporaries, but likewise by the pharmacists of the future.

A joint meeting of the Detroit Branch of the American Pharmaceutical Association and the Prescott Club of the University of Michigan, held at Ann Arbor, February 14, proved to be one of the most interesting of the year. A special car left Detroit at three o'clock with about thirty-five enthusiastic Detroit members aboard. The delegation was met at the University by Dr. Kraemer, professor of pharmacognosy. Assisted by Prof. Glover, Secretary of the College of Pharmacy, Dr. Kraemer conducted the visitors through the pharmacy and chemistry laboratories. One of the many interesting displays shown was the collection of materials from which the official selections for the last three United States Pharmacopoeias were made.

An excellent dinner was enjoyed at the Michigan Union, with Dr. Kraemer as host.

The delegation was honored by the presence of Dr. Hutchins, president of the University of Michigan, who, after a short address of welcome to the visitors, by Dr. Kraemer, spoke of his appreciation of the efforts of the American Pharmaceutical Association to obtain proper recognition for the profession. Both speakers paid high tribute to the memory of Dr. Prescott, in whose honor the Prescott Club was organized. C. F. Mann, treasurer of the Detroit Branch of the American Pharmaceutical Association, expressed the gratification felt by the Detroit representatives for the hearty welcome received, and having known Dr. Prescott personally, spoke of the wonderful character of the latter. He also voiced the sorrow of the Branch on account of the absence of Dr. Stevens and the sympathy of the organization for him in his recent bereavement.

The joint meeting of the two organizations was called to order by the president of the Prescott Club. "Paraffin Films and Oil Dressings for Treatment of Wounds and Burns," being a topic of keen interest at the present time, the talk and demonstrations given by Wm. Bonisteel were followed very closely. The Carrel-Dakin Solution is also attracting quite a lot of attention and Mr. Wagner, in presenting "Technique Employed in Making Carrel-Dakin Solution," aroused considerable discussion.

H. B. McWilliams showed very clearly the two sides of present pharmacy, the ethical and the commercial views, pointing out, that as a profession, the ethical side must predom-

inate. As defendants of each side were present, heated discussion followed.

The speakers were members of the Prescott Club, but the Detroit representatives were very active in the discussions.

After the meeting adjourned, refreshments were served, and a short social period enjoyed. Then the special car traveled swiftly to Detroit, being delayed only once, while a freight train of numberless cars held the crossing. But the hope that they were all coal cars prevented even murmurs against the delay, and soon the February meeting was a decidedly successful event of the past.

The March meeting also promises to be very interesting. Mr. Wendell, Display Manager of the J. L. Hudson Co., will discuss window displays and the methods of obtaining the best results. All Detroit pharmacists are acquainted with the successful exhibits of this company. Owing to the inclement weather at the time of the January meeting, Dr. Lescohier, who was scheduled for that meeting, will give a talk at the March meeting on "Biological Preparations, Serums, Antitoxins, Vaccines, etc." Since the biological preparations of Parke, Davis & Co. are so well known, Dr. Lescohier will be given a hearty welcome.

M. STRAWN,
Secretary.

NASHVILLE.

A joint meeting of the Nashville Branch of the American Pharmaceutical Association and the Nashville Drug Club was held Thursday, February 21st, D. J. Kuhn presiding.

Postmaster E. S. Shannon, of Nashville, was introduced and made a strong appeal to the members present to assist in the Government's Thrift Stamp campaign, asking them to become agents of the first class and thus help in this worthy cause. There was a general expression of willingness to assist in this work.

President H. L. Sperry, of the Morris Bank, was next introduced and explained the methods of this bank. He stated that 85 percent of the money loaned by this bank was to those who needed money because of sickness and that therefore a large portion loaned by this institution went to the druggists and doctors. He explained that druggists could frequently collect debts by assisting their debtors to negotiate loans which could be paid back in small installments. Mr. Sperry also stated

that druggists had an opportunity to act as agents for the bank and also as collectors of the payments that were to be made on the installment plan.

On motion of W. R. White, a War Service Committee was appointed, consisting of Messrs. S. C. Davis, D. S. Sanders and H. A. Buchi, this committee to represent the two associations in matters that required the co-operation of the druggists with the public and Government.

D. S. Sanders spoke on the subject of "How to Obtain a License to Sell Explosives." He dwelt upon the responsibility that rests upon druggists in selling explosives and poisons.

W. R. WHITE, *Secretary.*

NEW YORK.

The February 1918 meeting of the New York Branch of the American Pharmaceutical Association was called to order by President Mayer in the lecture hall of the New York College of Pharmacy on Monday, the 11th, at 8.30 P.M.

Seventy-five members were present.

The minutes of the January meeting were read and approved.

The Treasurer submitted his report which showed a balance of \$209.25 on hand.

Member of the Council.—Professor Hostmann sent word that it was impossible for him to be present and therefore no report was received.

Membership Committee.—The names of five new members were presented for membership in the parent association: Albert B. Muller, 2482 Valentine Ave., N. Y. City.; H. B. Shattuck, 31 East 17th St., N. Y. City; Frank Parker, 51 West 37th St., N. Y. City; Eugene Katz, 895 West End Ave., N. Y. City; Marmelo Patola, 353 First St., Jersey City, N. J.

The Secretary was directed to follow the usual course with regard to these applications.

Legislation and Education.—Mr. Lehman brought in a very comprehensive report dwelling especially on the new explosive requirements. He also announced that the following members would serve with him on the Committee of Legislation and Education: Fred Nitardy, Hugo Kantrowitz, Jeanmot Hostmann, Jacob H. Rehfuss.

Mr. Robert S. Lehman's report, after some discussion, was accepted.

Fraternal Relations.—In the absence of Dr. J. Leon Lascoff no report was received.

Progress of Pharmacy.—Dr. Diekmann brought in an elaborate report discussing, among others, the following subjects: Bacteria in Fungi, Toxic Value of Arsenates, Iodide of Starch in Treatment of Affected Wounds, Cattle Foods and Substitutes, Calcium Cyanamide as Fertilizer, War Emergency Formulas, Simulation of Disease, etc., and Its Detection.

Dr. Diekmann's report was received with considerable applause, which, after discussion, was ordered accepted.

It was now moved, seconded and carried that the Local Branch request the President of the Parent Organization to take such steps as are necessary to bring about the required research work, to determine substitute formulas of pharmaceuticals, etc., which would cause the saving in products needed in the present war or which at present are rare.

The Special Committee on By-Laws reported that no formal meeting of this committee was held and therefore no report could be brought in.

Dr. Hugo Kantrowitz presented an appreciation of Charles Caspari, Jr., by the A. Ph. A. It was moved, seconded and carried that this be made a part of our minutes. (See under Council Business.)

Dr. Robert P. Fischelis now read a paper on the Edmonds Bill and the work of the National Pharmaceutical Service Association. He was followed by Col. E. E. Persons, Commander of the American Ambulance Service at Allentown, Pa., who gave an informal "talk" of the organization of that service. Major H. Sheridan Becket, M.R.C., next gave a talk on the methods of the Army Medical Supply Depot, and the efficient work carried on by them.

These papers were followed by a very interesting discussion. A rising vote of thanks was then extended to the speakers and to Caswell A. Mayo, who had assisted in arranging the program.

Upon motion it was then voted to adjourn.

(Signed) HUGO H. SCHAEFER,

Secretary.

NORTHWESTERN

The Northwestern Branch of the American Pharmaceutical Association met in conjunction with the Scientific and Practical Section of the Minnesota State Pharmaceutical Association at 3:30 P. M., February 7th, in the West Hotel, Minneapolis, Minnesota. Dr. F. J. Wulling, chairman of the scientific section of

the state association, convened the meeting. The following program of the scientific section was carried out:

1. "A Practical Problem," by Gustav J. Demars.

2. "Hints to Success," by Max Menzel.

3. A brief address by President M. L. Burton, of the University of Minnesota.

4. "War Emergency Formulas"—Suggestion for changes in the preparations of the U. S. P. and N. F. for the conservation of glycerin, sugar and alcohol; a symposium to be opened by Mr. F. A. U. Smith.

5. "Behind the Prescription Counter," by Rasmus Bartleson.

6. "Venereal Diseases"—a symposium to be opened by Dr. Chas. E. Smith, Jr.

7. "The Biologic Assay of Digitalis Produced in the Medicinal Plant Garden, College of Pharmacy, University of Minnesota, 1917," by E. L. Newcomb and Chas. H. Rogers; read by Dr. Newcomb.

8. "A Method for Cleaning Digitalis, with a Study of the Inorganic Constituents," by Chas. H. Rogers and E. L. Newcomb; read by Dr. Rogers.

9. Report of the Chairman of the Committee on Adulterations, by Gustav Bachman.

10. "The Advent of Pharmacists to St. Paul," by Herman Rietzke.

11. "The College of Pharmacy of the University of Minnesota (continued from 1917)," by F. J. Wulling.

The committee appointed to formulate suitable resolutions on the demise of the late President Charles Holzhauer and Professor Charles Caspari, Jr., submitted the following:

REPORT OF THE COMMITTEE APPOINTED TO
FORMULATE SUITABLE RESOLUTIONS ON
THE DEMISE OF THE LATE PRESIDENT
CHARLES HOLZHAUER AND PRO-
FESSOR CHARLES CASPARI, JR.

WHEREAS, By the will of Divine Providence our devoted friends and fellow co-workers, Charles Holzhauer and Charles Caspari, Jr., have been taken from our midst at a time when their counsel and advice were so valuable; and

WHEREAS, We, the members of the Northwestern Branch of the American Pharmaceutical Association, deeply feel the sad loss of such staunch friends, capable, willing and talented workers for the betterment and advancement of pharmacy, devoid of selfish interests, always sacrificing self for the good and betterment of their fellow-men, and per-

sistent thinkers and workers to place pharmacy on the highest plane possible; and

WHEREAS, We further wish to acquaint their friends and families of the high regard in which they were held and the great loss which we feel the pharmaceutical profession has sustained through their sudden demise, now, therefore be it

Resolved, That we give expression of our deep heartfelt sorrow at their untimely death, our high appreciation of the many sterling qualities that bound them to us on all occasions and at all times, and our sincere sympathy to their families and to all those who mourn their loss; and be it further

Resolved, That a copy of these resolutions be spread upon the records of the Northwestern Branch of the American Pharmaceutical Association and that a copy of the same be forwarded to their families.

F. J. WULLING,
Chairman.

A motion was made, seconded, and unanimously carried to include Professor Remington's name in the resolution.

The following officers were elected for the year 1918:

President, C. H. Bollinger, St. Paul; *Vice-President*, Gustav Bachman, Minneapolis; *Secretary and Treasurer*, C. H. Rogers, Minneapolis; *Members of the Executive Committee*, Stewart Gamble, Minneapolis; Wm. A. Frost, St. Paul; Wm. A. Abbott, Duluth; E. E. Tupper, Minneapolis.

CHAS. H. ROGERS,
Secretary.

PHILADELPHIA.

The January meeting of the Philadelphia Branch of the American Pharmaceutical Association was annulled out of respect to the memory of the late Professor Joseph Price Remington.

On Saturday evening, January 12th, a special meeting of the Local Branch was called by the president, Ambrose Hunsberger, at his home, 1600 Spruce Street. The meeting was hurriedly convened to honor Secretary Henry, of the N. A. R. D. On account of the uncertainty of Mr. Henry's stay in Philadelphia, it was impossible to notify the entire membership, in consequence of which the gathering was not large. After discussing at some length all matters pharmaceutical, the company partook of refreshments generously furnished by the host of the evening. President Hunsberger, acting as toastmaster, deftly ex-

plained the purport of the meeting when he graciously presented to Mr. Henry, on behalf of the Local Branch, an engraved silver loving cup. It bore upon it an inscription of the appreciation of the Branch of Secretary Henry's good services to the pharmaceutical profession. Mr. Henry's response was most sincere and aptly worded. President-elect LaWall, of the American Pharmaceutical Association also expressed the sentiments of those present when he said that Philadelphia's loss of Secretary Henry's services was compensated for in the knowledge that he would still be serving pharmacy and in a larger way. Other speakers were E. G. Eberle, O. W. Osterlund, E. G. Allen, W. E. Supplee, R. P. Fischelis, R. H. Lackey, Otto Kraus and Ivor Griffith.

The February meeting of the Philadelphia Branch of the American Pharmaceutical Association was held at the Philadelphia College of Pharmacy on Tuesday evening, February 5th, with the president, Ambrose Hunsberger, in the chair. Prof. Charles H. LaWall opened the scientific program with an excellent paper on the subject of "Colloids." The Professor's paper comprehensively treated the difficult subject and rendered a pleasing and understandable survey of this new field of physical science. Counter experiments added to the value and interesting character of the paper. It is seldom the privilege of listeners to have such an apparently scientific and abstruse matter placed before them in such a lucid and interesting manner. The devious ways in which colloidal bodies play their part in pharmacy were enumerated and explained. Professors Stroup and Gershenfeld participated in a discussion of this paper.

President Hunsberger then requested W. L. Cliffe to assume the chair temporarily, and read his paper on "Practical Drug Conservation," in which he revealed a number of practical suggestions for the sensible saving of drug supplies which are daily becoming more scarce. Mr. Hunsberger did not favor a radical change of formulas in order to conserve such products as alcohol, glycerin and sugar. A more feasible way, according to the speaker, was to have each pharmacist take the matter up with the neighborhood physicians and ask their cooperation in this matter of conservation. This was the opportune time for the pharmacist to display his ability to render assistance to the prescribing physician by suggesting new formulas, etc. The speaker re-

cited instances where he had done this with gratifying results to himself as well as the physician. He also pointed out that there were several liquid pharmaceuticals which contained an excess of either one of the previously named products and suggested that considerable conservation might be accomplished by cutting down the quantities where legally and ethically permissible. Mr. Hunsberger pointed out as a concrete example that if it were possible to have physicians all through the country to stop prescribing "elixir of terpin hydrate" and to use capsules in its place several tons of glycerin and alcohol might be conserved each day. Ways of saving containers by eliminating odd sizes, etc., were also mentioned.

Mr. Hunsberger's paper was fully discussed by Professors Cook, Fischelis, LaWall and Gershenfeld, Messrs. E. G. Eberle, W. L. Cliffe, W. McNeary and Ivor Griffith.

Professor Cook placed a motion before the branch authorizing the President to nominate a committee of three to study this matter of drug conservation and present a comprehensive report at the next meeting. The motion was duly seconded and carried. The Branch then went on record as giving its full endorsement to the Edmonds' Bill soon to come before Congress.

The meeting was attended by more than fifty persons.

IVOR GRIFFITH,
Secretary.

COUNCIL BUSINESS

A. PH. A. COUNCIL, LETTER NO. 11.

PHILADELPHIA, February 6, 1918.

To the Members of the Council:

Motion No. 17 (Approval of Membership of Committee on Research) and Motion No. 18 (Election of Members; applications Nos. 63 to 68 inclusive) have each received a majority of affirmative votes.

F. Lentz, Secretary-Treasurer of the Baltimore Branch writes that: "I beg to advise that at the last meeting of the Baltimore Branch of the American Pharmaceutical Association, held January sixteenth, Dr. E. Frank Kelly, of 302 Edgevale Road, Baltimore, was elected a member of the Council of the American Pharmaceutical Association to represent this Branch for a term of three years."

The following Tentative Program for the Sixty-sixth Annual Meeting of the Association to be held at Chicago during the week of August 12th to 17th inclusive, is submitted by the Committee on Program, the General Secretary, Secretary of the Council and Local Secretary. Comments and suggestions are invited.

TENTATIVE PROGRAM.

Monday.

- 9.30 A.M. National Association Boards of Pharmacy.
- 2.00 P.M. National Association Boards of Pharmacy.
- American Conference of Pharmaceutical Faculties.

- 8.00 P.M. National Association Boards of Pharmacy.

American Conference of Pharmaceutical Faculties.

Tuesday.

- 9.30 A.M. National Association Boards of Pharmacy.
- American Conference of Pharmaceutical Faculties.
- 2.00 P.M. Joint Session of National Association Boards of Pharmacy.
- American Conference of Pharmaceutical Faculties and Section on Education and Legislation.
- 7.00 P.M. Council Meeting.
- 8.00 P.M. First General Session of Association.

Wednesday.

- 9.30 A.M. Scientific Section, first session.
- Section on Education and Legislation, second session.
- Women's Section, first session.
- 12.30 P.M. Alumni Luncheons.
- 2.00 P.M. Commercial Section, first session.
- Section on Practical Pharmacy and Dispensing, first session.
- 7.00 P.M. Council Meeting.
- 8.30 P.M. President's Reception.

Thursday.

- 9.30 A.M. Section on Education and Legislation, third session.
- Commercial Section, second session.
- Historical Section, first session.

- 2.00 P.M. Section on Practical Pharmacy and Dispensing, second session.
 Scientific Section, second session.
 Women's Section, second session.
 7.00 P.M. Council Meeting.
 8.00 P.M. Second General Session of Association.

Friday.

- 9.30 A.M. Scientific Section, third session.
 Section on Practical Pharmacy and Dispensing, third session.
 2.00 P.M. House of Delegates.
 4.00 P.M. Entertainment.

Saturday.

- 9.00 A.M. Council Meeting.
 10.00 A.M. Final General Session of Association.

Motion No. 19 (Election of Members). You are requested to vote on the following applications for membership:

- No. 69. Benjamin Greenblatt, 209 So. Madison St., Iowa City, Iowa, rec. by W. J. Teeters and R. A. Kuever.
 No. 70. Henry Emil Zutz, 673 N. Dale St., St. Paul, Minn., rec. by Wm. B. Day and F. J. Wulling.
 No. 71. A. C. Herting, 3504 Federal St., Camden, N. J., rec. by E. G. Eberle and J. W. England.
 No. 72. Robert Litson Gaddy, Woodruff, S. C., rec. by H. M. Whelpley and J. W. England.
 No. 73. John Northrup Cole, 50 Golden Gate Ave., San Francisco, Cal., rec. by J. L. Lengfeld and Wm. B. Day.
 No. 74. Dr. S. H. Jee, The Hunan-Yale Hospital, Changsha, Hunan, China, rec. by J. W. England and E. G. Eberle.
 No. 75. Drexel W. Haines, 134 Douglas Ave., Freeport, Ill., rec. by E. G. Eberle and W. B. Day.
 No. 76. Lionel T. Andrews, 3917 Syvset St., Woodhaven, L. I., rec. by Charles H. LaWall and Charles S. Herron.
 No. 77. Emiliano Delgado y Valdes, Salud n° 60 bajos (Laboratorio), Havana, Cuba, rec. by J. G. Diaz and Jose P. Alacan.
 No. 78. Carl A. Seuring, 1501 E. 67th St., Chicago, Ill., rec. by Charles Orr and Clyde M. Snow.
 No. 79. George V. Haering, 570 W. Madison St., Chicago, Ill., rec. by Wm. Gray and Wm. B. Day.
 No. 80. Frank H. Ahlborn, 1144 Bryn Mawr Ave., Chicago, Ill., rec. by Wm. B. Day and Wm. Gray.
 No. 81. Dr. A. Rodriguez Castro, Calle Separacion No. 113, Santo Domingo, Republica Dominicana, rec. by R. L. Greene and Emil Reyer.
 No. 82. Haig Bedros Yardumian, 48 Montgomery St., Boston, Mass., rec. by Bagdasar Goolkasian and Wm. B. Day.
 No. 83. Michael Jacobson, 2600 N. Halsted St., Chicago, Ill., rec. by Charles Orr and Wm. Gray.
 No. 84. Peter A. Mandabach, 608 S. Dearborn St., Chicago, Ill., rec. by H. M. Whelpley and J. W. England.

J. W. ENGLAND, *Secretary.*

415 N. 33RD STREET.

CHARLES CASPARI, JUNIOR.

1850-1917.

AN APPRECIATION BY THE AMERICAN PHARMACEUTICAL ASSOCIATION.

For the loyal and unselfish devotion of more than half of the years of his active manhood to the editing of its publications; for the twenty-three years of careful and conscientious service as its Secretary; for his helpful attentions and courtesies to its officers and members, the American Pharmaceutical Association desires, through a duly authorized committee, to make full and ample acknowledgment to his family, to pharmacy and to the world.

The Association would also give expression to the deep sorrow the death of Dr. Caspari brought to all its members who knew him and would pay just tribute to his unusual abilities, broad attainments, sterling character and pure life.

To such an end and for the purposes therein stated, the foregoing is most respectfully offered.

(Signed) H. P. HYNSON, *Chairman.*
 JOHN C. MUTH,
 GEORGE M. BERINGER,
 CASWELL A. MAYO,
 J. H. BEAL.

January 30, 1918.

COMMITTEE REPORTS

REPORT OF THE COMMITTEE ON THE UNITED STATES PHARMACOPOEIA.

It is with much interest and satisfaction that the members of this Committee have perused the pages of the new U. S. Pharmacopoeia and have noted the various comments thereon that have appeared from time to time in the pharmaceutical press.

We are very glad to note that comments and reviews as have appeared are on the whole kindly and that this Ninth Revision continues to maintain for the U. S. P. the foremost position among the pharmacopoeias of the world.

With the increase in the magnitude of the work of revision, the time required must necessarily be greater and, owing to the rapid growth of our materia medica, it would seem that a revision at less remote intervals or at least a supplement would be desirable.

The admissions to the U. S. P. on the whole seem to be well chosen and conservative. Regret is expressed by some members of the medical profession that acetyl salicylic acid was not included in this list. Concerning the deletions there is a greater difference of opinion. Most physicians dislike to have a remedy that they are accustomed to use dropped from the official list, and such deletions do not seem to us to add to the usefulness and purpose of the U. S. P.

In the short time at the disposal of the Committee this year it has been impossible to cover seriatim the entire scope of the new book. The Committee does not desire to make any general or specific recommendations at this time. The following observations, however, have been made by the members and are hereby recorded for future reference.

NOMENCLATURE.

That the botanical names employed in the Pharmacopoeia should be in accord with the best knowledge and the best usage of botanists goes without saying. An article has been recently published by Mr. O. A. Farwell in the *Druggists Circular* for April 1917, criticising in detail the botanical nomenclature of the U. S. P. IX. Mr. Farwell's work has been done with intelligence and thoroughness, the majority of his criticisms pointing out needed changes. His article is timely and should open the way for more extended remarks and some lively discussions among the botanists.

It seems particularly unfortunate that the Pharmacopoeia should for any real or fancied reason adopt titles that may lead to confusion or to depart from an established custom as has been done in the following instances:

Ferri et Quininae Citras U. S. P. IX is entirely different from the *Ferri et Quininae Citras* of the U. S. P. VIII.

Ferri Phosphas U. S. P. IX is not really ferric phosphate and tends to confuse the ferric phosphate of the pharmacist with the ferric phosphate of the chemist.

Cascara Sagrada U. S. P. IX. What is the precedent for this change?

VEGETABLE DRUGS.

The following errors have been noted:

Cascara Sagrada. In the description of the sections (second paragraph, third line) the stone cells are described as being in the outer bark. They are usually considered as being in the middle bark, the cork being considered the outer bark.

Foeniculum. In the description of the sections (second paragraph, tenth line) the two vitae are on the commissural surface and not on the dorsal surfaces as stated.

Viburnum Prunifolium. The drug should be defined as the dried bark of the root since that is the article subsequently defined.

ASSAY PROCESSES.

We are pleased to note that the assay processes both organic and inorganic have been greatly improved and extended. The following points have come to our notice:

Acetonum. To insure accuracy, should read, "Partially fill with distilled water a stoppered weighing bottle and note the exact tare; then introduce about 1 mil of acetone, stopper and weigh accurately."

Acidum Aceticum Glaciale. In the assay the directions should read, "Introduce into a stoppered weighing bottle about 10 mls of distilled water and take the exact tare of the whole, add about 2.5 mls of glacial acetic acid and weigh accurately, etc." The text calls for simply a "tared flask" to which 10 mls of distilled water (weight deduced presumably from its measure and the stopper) comes in as an afterthought apparently.

Acidum Hydrochloricum and Acidum Nitricum. Comments similar to those under *Acidum Aceticum Glaciale* apply equally well to these.

Acidum Citricum. This is distinctly an efflorescent substance although the pharmacopoeias generally describe it as "permanent in the air" or at most as efflorescent at temperatures above 30° C. As long as it remains in translucent crystals it may be regarded as uneffloresced but when in powder this cannot be assumed and we know that the crystals in time become quite opaque from efflorescence unless kept in well closed containers. In the assay, therefore, the sample should always be rendered anhydrous before weighing, by drying at 100° C. to constant weight. The assay will then show in the dried salt not less than 99.5 percent of $C_6H_8O_7$. Each mil of normal potassium hydroxide V. S. will correspond to 0.06402 Gm. of $C_6H_8O_7$ and each Gm. of the dried acid will correspond to 15.56 mls of normal potassium hydroxide, V. S. (if pure, 15.62 mls).

Acidum Sulphuricum. After mixing 1 volume of the acid with 50 of distilled water, is it necessary to cool the mixture before titrating?

Acidum Sulphuricum Aromaticum. It has been shown that the use of a reflux condenser in the preparation of a sample for assay is a mistake. The proper procedure is to add to the acid three times its volume of distilled water and heat in an uncovered beaker on a boiling water bath for four hours to effect hydrolysis of the ester present. Titration will then show correctly the quantity of sulphuric acid originally present. The results obtained from the assay in the text are much too low.

Aconitum. Dr. H. Engelhardt points out that the assay processes for both the fluidextract and solid extract and possibly the tincture should be thoroughly revised, it being impossible to obtain concordant results when using cochineal as indicator. Methyl orange appears to give better results. A detailed report is forthcoming.

Alkaloids and Alkaloidal Drugs. In a few instances a rubric is given for the alkaloids and alkaloidal salts. This might well be extended to all of them since it is a well-known fact that many contain an excess of water and, etc. It is becoming more and more imperative to qualitatively examine the alkaloidal residues obtained in the assay of galenical preparations. Some attention to this is advocated for the U. S. P. X.

In several of the assay processes of the U. S. P. IX for fluidextracts and tinctures, purified oak sawdust is employed. This oak sawdust is not so easily obtained as one without experience might imagine. Dr. A. B. Lyons suggests that cheese cloth is a convenient substitute easily obtained and easily manipulated.

Alumen. Under the assay process the surprising statement is made that "the aluminum oxide obtained corresponds to not less than 99.5 percent of alum assayed." The meaning is that the aluminum oxide obtained corresponds to $AlNH(SO_4)_2 + 12H_2O$ or $AlK(SO_4)_2 + 12H_2O$ as the case may be, equal in weight to 99.5 percent of the alum taken for the assay.

Alumen Exsiccatum. Although it is required that the label state whether it is potassium or ammonium alum from which the exsiccated product is made, there is no intimation that one differs materially from the other. It requires that not more than 2.5 percent of the dried alum be insoluble in water. Of course if made from potash alum it would be wholly soluble. There seems to be no reason why an allowance of 3.5 percent for impurities should be made in case a potassium alum is used. Query: Does the insoluble residue consist of Al_2O_3 ? If so, it should be strongly ignited before weighing. Then since the aluminum oxide constitutes something like 20 percent of the salt, the amount of impurity indicated will be much greater than seems to have been assumed in preparing the article on Exsiccated Alum.

Ammonii Carbonas. In the assay the reading should be, "Put into a stoppered weighing bottle about 10 mls of distilled water, ascertain the exact tare; add about 2 Gm. unaltered, translucent ammonium carbonate and weigh accurately. When the salt is dissolved, transfer the solution to a "suitable beaker or flask with the aid of about 40 mls of distilled water, add 50 mls of normal sulphuric acid, V. S., and titrate the excess of acid with normal potassium hydroxide, V. S. using methyl orange T. S. as indicator."

Aqua Ammoniae Fortior. It would be well to require that a stoppered weighing bottle be used in weighing the sample for assay, as in the case of water of ammonia, 10 percent.

Bismuth Salts. The method for the estimation of the bismuth oxide in these is a rather crude one. A convenient electrolytic method would be acceptable.

Caffeina Citrata. In the third line from the bottom of the assay, insert before "Citrate of Caffeine" the word "dried."

Caffeinae Sodio-Benzoes. In the assay for sodium benzoate the statement should be made that "each mil of half-normal sulphuric acid V. S. used corresponds to 0.07202 Gm. of $\text{NaC}_7\text{H}_5\text{O}_2$. Each Gm. of the dried mixture corresponds to not less than 6.94 nor more than 9.50 mls of half-normal sulphuric acid V. S." Note that in the assay of sodium benzoate, p. 383, the salt is dried at 110°C ., while in this case the drying is done at 80°C .

Hydrargyri Iodidum Rubrum. Only the electrolytic method is given. An alternate method would be acceptable.

Liquor Cresolis Compositus. A method for the assay of this preparation is needed, especially a method for the estimation of the amount of water in the product.

Liquor Potassii Hydroxidi. There is something puzzling about the expression at the top of page 253: "The solution shows not more than 5.5 percent of alkalinity calculated as KOH (carbonate)." The word "carbonate" should be deleted or else explained. As a matter of fact this test should form part of the assay process, which should be so performed as to show the presence of not less than 4.5 percent of KOH, and to limit the total alkali, including the carbonate, to the equivalent of 5.5 percent. This comment applies equally to *liquor sodii hydroxidi*.

Opium and its Preparations. A reduction in the amount of slaked lime used in the assay would seem feasible.

Resina Jalapae. In the determination of the solubility of the resin in chloroform and in ether, no account is taken of the amount likely to be absorbed by the filter paper. The evaporation of an aliquot part would give more concordant results.

Spiritus Ammoniae Aromaticus. An assay process is desirable since an appreciable loss of ammonia is liable to occur during the manufacturing process.

Tinctura Iodi. The heating of the evaporated tincture until the free iodine is expelled is liable to produce losses. It is much simpler to convert the iodine into halide by thiosulphate or preferably sulphite, titrating the total amount of halide, etc.

Zincum. In the electrolytic estimation of zinc it is recommended to use a nickel dish or a platinum dish upon which a thin layer of silver or copper has been previously deposited. Dr. H. Engelhardt points out that a mercury cathode cup gives just as good results and is even more rapid than the nickel dish method.

BIOLOGICAL ASSAYS.

The value of these has been officially recognized for the first time in the U. S. P. IX. This is a move in the right direction, but it is very unfortunate that the only compulsory standard, that of cannabis, should lack the essence of standardization, namely a standard for comparison. Why not have the United States Public Health Service establish the standard here as in the case of antitoxins?

PREPARATIONS.

But little comment on these is believed to be justifiable at this time.

Collodium Flexile. Some doubt is expressed as to the advisability of the substitution of camphor for Canada balsam.

Emplastrum Plumbi. Some experiments have indicated that it requires about five hours' boiling to complete the reaction in this preparation. Since constant stirring with a wooden spatula is also one of the requirements, this formula is not likely to become popular with the retail pharmacist nor to stimulate in him an interest in manufacturing pharmacy.

Unguentum Iodi Although this ointment is not to be dispensed unless it has been recently prepared, a rapid absorption of the iodine takes place and experiments with vehicles other than lard are suggested.

EFFLORESCENT SALTS.

In the case of a considerable number of more or less efflorescent salts the new Pharmacopoeia has abandoned the principle of the "Rubric of Purity," heretofore consistently followed in dealing with nearly all mineral salts, and has established new standards essentially fallacious. The

fallacy depends upon the fact that assay processes are prescribed for such salts without requiring that they be rendered anhydrous, or at least that they be brought to a definite condition of hydration before the sample taken for assay is weighed.

The list of salts to which this criticism applies includes the following which will be discussed seriatim: Copper sulphate, ferrous sulphate, magnesium sulphate, sodium sulphate, zinc sulphate, sodium acetate, sodium arsenate, sodium borate, sodium phenolsulphonate, sodium phosphate, sodium thiosulphate, lead acetate, zinc acetate, zinc phenolsulphate, zinc valerate, and potassium and sodium tartrate.

Cupri Sulphas. Crystallized copper sulphate, which is the official salt, contains 5 molecules of water of crystallization. Exposed to dry air at ordinary temperature, it loses by efflorescence 2 H₂O; at 100° C. the total loss amounts to 4 or 5 molecules of water leaving a monohydrated salt. It is in this condition that a sample should be weighed for assay, if a definite rubric is to be fixed. Instead the U. S. P. IX starts with the salt in the condition in which it happens to be. It may contain hygroscopic moisture or on the other hand it may have lost a part of its water of crystallization. The apparent "impurity" (calculating the salt as CuSO₄ + 5H₂O) may be high including water (hygroscopic) or it may be low (even a minus quantity), owing to loss of water of crystallization. The Pharmacopoeia determines in the sample taken, not CuSO₄ + 5H₂O but simply CuSO₄ and proceeds to deduce a rubric standard. The salt contains, it says, not less than 62.97 percent of CuSO₄ corresponding to not less than 98.5 percent of the crystallized salt. One infers that this permits a maximum of 1.5 percent "impurity" in the salt. The fallacy becomes apparent when we attempt to reason in a similar manner from the maximum (66.79 percent) amount of CuSO₄ that may be permitted, since this would correspond with 104.48 percent of CuSO₄ + 5H₂O, showing a minus impurity of 4.48 percent. In fact, the assay has told us nothing about the presence of fixed impurities in the salt. In order to make this clear suppose that a sample of copper sulphate containing 0.5 percent of fixed impurity has lost by efflorescence 2 percent of water, the assay will show the presence of apparently 101.5 percent of CuSO₄ + 5H₂O. Or, suppose that a salt containing 2 percent of fixed impurities has lost by efflorescence 1 percent of water. Assay will show apparently nearly 99 percent purity.

Clearly the assay is of no value as a criterion of the real purity of the sample. It seems only to show whether or not the salt conforms to an arbitrary fixed standard whose significance is uncertain. It would be far more rational to make the requirement depend upon the amount of residual H₂O in the salt. A sample dried to constant weight at 110° C. must lose not less than—nor more than—of its weight. However, the only scientific plan is to establish as usual a rubric of purity and provide an assay process for determining the degree of purity, then if necessary there may be also provided a limit of permissible efflorescence.

The assay would then be made as follows: "Dissolve about 1 Gm. of copper sulphate, previously dried to constant weight at 110° C. (a tentative figure) and accurately weighed, in 50 mls of distilled water, add 4 mls of acetic acid and 3 Gm. of potassium iodide, and titrate the liberated iodine with tenth-normal sodium thiosulphate, V. S., starch T. S. being used as indicator. It shows in the dried salt not less than 99.5 percent of CuSO₄ + H₂O. Each ml of tenth-normal sodium thiosulphate, V. S., corresponds to 0.017766 Gm. of CuSO₄ + H₂O. Each Gm. of dried copper sulphate corresponds to not less than 56.00 mls of tenth-normal sodium thiosulphate V. S." If we wish to limit the permissible amount of efflorescence, direct to "weigh accurately about 1 Gm. of the copper sulphate and dry it to constant weight at 110° C. It loses not less than 9 percent of its original weight." It is doubtful however if multiplying the requirements of this kind is expedient. In the case of copper sulphate it seems particularly unnecessary to resort to a quantitative standard. If the official salt is in the form of crystals, as it may well be, efflorescence shows itself at once by a striking change in color. Only uneffloresced crystals should be dispensed. Even in preparing Fehling's solution, the official directions are merely to use "carefully selected small crystals of cupric sulphate" (Cupri Sulphas, U. S. P.) though, perhaps, a method of standardization would be desirable here; posological considerations, however, do not demand greater exactness than can be secured by attention to the physical properties of the salt.

Ferri Sulphas. The facts regarding this salt are closely analogous to those regarding copper sulphate. Its crystals have a distinctive color, strikingly changed by efflorescence. It loses all but one molecule of its water of crystallization at a temperature not much above 100° C. It differs from the copper salt in that it tends to absorb oxygen, while the latter is subjected rather to a partial deoxidation. The analysis of ferrous sulphate for fixed impurities, providing oxida-

tion has not taken place, may be made exactly as in the case of copper sulphate, and the description excludes an oxidized salt. The dried salt retains one molecule of water having, therefore, a molecular weight of 169.93.

The directions for the assay would be: "Dissolve about 0.6 Gm. of ferrous sulphate, previously dried to constant weight at 115°C . and accurately weighed, in about 25 mls of diluted sulphuric acid and titrate with tenth-normal potassium permanganate V. S. until a permanent pink color is produced. It shows not less than 99.5 percent of $\text{FeSO}_4 + \text{H}_2\text{O}$. Each ml of tenth-normal potassium permanganate, V. S., corresponds to 0.016993 Gm. of $\text{FeSO}_4 + \text{H}_2\text{O}$; each Gm. of the dried salt corresponds to not less than 58.5535 mls (100 percent = 58.8478)." (Of course, any ferric salt would be included in the impurities thus determined.) It hardly seems necessary to add a quantitative test for loss of water by efflorescence. The statement in the text (first paragraph of fine print) is sufficient.

Note that in the Dried Ferrous Sulphate no attempt is made to ascertain the "purity" of the salt. The granulated salt is of necessity free from such fixed impurity but should be freshly prepared.

Magnesii Sulphas. Here again we have a salt whose crystals when heated to 150°C . lose all but one molecule of their water of crystallization. The suggested assay would be: "Dissolve about 0.6 Gm. of magnesium sulphate, previously dried to constant weight at 150°C ., in 100 mls of distilled water, etc." (See U. S. P., p. 265.) "The weight of magnesium pyrophosphate obtained corresponds to $\text{MgSO}_4 + \text{H}_2\text{O}$ amounting to not less than 99.5 percent of the weight of the dried salt taken for assay. Each Gm. of the dried salt corresponds to not less than 0.80057 Gm. of magnesium pyrophosphate (pure = 0.80459). Each Gm. of magnesium pyrophosphate corresponds to 1.118583 Gm. of $\text{MgSO}_4 + \text{H}_2\text{O}$." The question of what degree of purity should be required for magnesium sulphate is open for discussion. The B. P. permits of 2.3 percent impurity which certainly seems large. The U. S. P. VIII permitted only 0.3 percent which certainly is too stringent. German and Swiss Pharmacopoeias provide a dried magnesium sulphate containing 23.69 percent of water, corresponding approximately to the formula $\text{MgSO}_4 + 2\text{H}_2\text{O}$. This is to be dispensed whenever magnesium sulphate in powder is required. Although this plan seems preferable to the requirement that the salt shall not have lost by efflorescence more than a certain percent of water (to be ascertained by a time-consuming quantitative operation), it does not seem advisable to confuse retail dealers with an alternative form of magnesium sulphate which they are to remember to dispense in place of the familiar epsom salt. It is to be remembered that this is a drug most frequently self-prescribed and sold very commonly in rural districts by persons not professional pharmacists. All things considered, it seems sufficient to describe the official salt as consisting of "crystals which are translucent" and add that "if they have become opaque by efflorescence they should not be employed for any pharmaceutical use, except after recrystallization." If any limit is to be prescribed for the permissible amount of efflorescence, the determination should be made by drying a sample of the salt at a temperature of 150°C ., when the loss in weight should be not less than, say, 8 percent.

Sodii Sulphas. This salt effloresces very rapidly in dry air. Moreover the proportion of water of crystallization it contains (10 molecules = 55.91 percent) is very large. Since it loses the whole of this water by drying at 100°C ., determination of absolute purity in the salt is a simple enough matter. A purity rubric of 99 percent in the anhydrous salt is, perhaps, reasonable and should be described as follows: "Assay: Dissolve about 0.5 Gm. of sodium sulphate, previously dried to constant weight at 120°C . and accurately weighed, in 100 mls of distilled water, and etc.," following the language of the text, but making the statement that "it indicates in the dried salt not less than 99 percent of Na_2SO_4 . One Gm. of $\text{BaSO}_4 = 0.60859$ Gm. Na_2SO_4 . One Gm. of dried sodium sulphate = 1.6267 Gm. BaSO_4 (pure = 1.64313 Gm.). The comments above on Magnesium Sulphate apply more pertinently to Glauber's salt which is not now often prescribed for human patients. The maintaining of a limit of permissible efflorescence seems to be wholly impracticable. Of course, the direct determination of the residual water, by drying the sample to constant weight, is much to be preferred to the determination of the sulphuric radical as now proposed in the Pharmacopoeia. It would be better to make the completely effloresced salt official if it is found that this is not too hygroscopic. In such case a dried salt of definite composition, having little tendency to absorb or give up water, might be substituted for the dehydrated salt, just as in the U. S. P. VIII ordinary crystallized sodium carbonate was replaced by the more

permanent monohydrated variety. It is to be noted that the German and Swiss Pharmacopoeias have a dried sodium sulphate (similar to dried magnesium sulphate).

Zinci Sulphas. This salt is similar in constitution and behavior to the sulphates of iron (ferrous) and magnesium. A rubric of purity should be provided, and the assay should be made on a sample, dried to constant weight at 120°C . before weighing, having, therefore, the composition of $\text{ZnSO}_4 + \text{H}_2\text{O}$. This yields in the assay an amount of ZnO corresponding to 99.5 percent of $\text{ZnSO}_4 + \text{H}_2\text{O}$ in the dried salt. One Gm. $\text{ZnO} = 2.2054$ Gm. of $\text{ZnSO}_4 + \text{H}_2\text{O}$. One Gm. ZnSO_4 dried = 0.45116 Gm. ZnO (pure = 0.453426). The comments under magnesium sulphate apply to zinc sulphate.

Potassii et Sodii Tartras. It is doubtful if this salt is sufficiently efflorescent to make it necessary to provide a limit of permissible water of crystallization. It occurs in the market, however, most commonly in the form of powder which is recognized as official. For assay, transparent crystals (powdered and pressed between folds of filter paper) may be weighed without further drying. The powder cannot be dealt with quite as satisfactorily. It may be recrystallized, it is true, but in doing so a considerable amount of the impurities will be left behind in the mother liquid. The alternative is a cautious drying of the salt to constant weight at a temperature raised gradually to 215°C ., being careful not to carbonize it to any degree. Probably the desiccation can be facilitated by adding repeatedly small quantities of alcohol. Assuming that a satisfactory way can be found to accomplish the desiccation without injuring the organic salt, the further procedure for determining the purity of the salt will be obvious. If we are to rely upon weighing the transparent crystals as $\text{KNaC}_4\text{H}_4\text{O}_6 + 4\text{H}_2\text{O}$, the assay will be conducted as in the text, but the statement will be: "It shows not less than 99 percent of $\text{KNaC}_4\text{H}_4\text{O}_6 + 4\text{H}_2\text{O}$. Each mil of half-normal sulphuric acid, V. S., used corresponds to 0.07055 Gm. of $\text{KNaC}_4\text{H}_4\text{O}_6 + 4\text{H}_2\text{O}$. Each Gm. of potassium and sodium tartrate corresponds to not less than 14.033 mls of half-normal sulphuric acid (pure = 14.1743 Gm.)."

Sodii Arsenas. This salt loses the whole of its water of crystallization (40.41 percent) at 150°C . It should be thus dried to constant weight before weighing to determine purity. For the assay take about 0.3 Gm. of the dried salt accurately weighed. The statement will be: "It shows not less than 98 percent of Na_2HAsO_4 in the dried salt. Each mil of tenth-normal sodium thiosulphate, V. S., used corresponds to 0.009298 Gm. of Na_2HAsO_4 . Each Gm. of dried sodium arsenate corresponds to not less than 105.39 mls of tenth-normal sodium thiosulphate, V. S. (pure = 107.544 mls)." It does not seem necessary to fix a limit of permissible efflorescence for this salt. The description calls for the uneffloresced salt (transparent) which is to be preserved in well closed containers. Then, if a product assumably uniform in strength is desired, we find provided the exsiccated salt. It is really not desirable that both of these forms should be official, one nearly double the strength of the other. The dried salt is the one that should be retained. As long as there are two, errors in dosage are sure to occur. It is interesting to note that the International Pharmaceutical Congress adopted $\text{Na}_2\text{HAsO}_4 + 7\text{H}_2\text{O}$ as sodium arsenate.

Sodii Acetas. At 120°C . it loses all of its water of crystallization (39.72 percent). The salt should be dried accordingly before weighing. It shows not less than 99 percent of $\text{NaC}_2\text{H}_3\text{O}_2$ in the dried salt, etc. Each mil of dried sodium acetate corresponds to not less than 24.14 mls of half-normal sulphuric acid (pure = 24.384 mls). (If any efflorescence limit is prescribed it may well be required merely that the salt lose, in drying to constant weight at 120°C ., not less than 32 percent of its weight.) The description of the official salt should include only colorless transparent crystals. Then if the salt is preserved in well-closed containers it will not effloresce sufficiently to affect the dosage materially.

Sodii Boras. When dried thoroughly and the residue heated to redness it becomes anhydrous, losing, if pure, 47.14 percent of water. Instead of reducing the salt to an anhydrous condition before weighing a portion for assay, it is better to powder about 15 Gm. of the sample and weigh out separately two portions, one of about 5 Gm. the other of about 1 Gm., both to be weighed accurately. Dry the smaller portion and heat it to the point of igneous fusion. From the loss in weight of this sample, determine the weight of the larger sample in anhydrous condition. Use this portion for the assay as directed in the text, changing the reading to: "It shows in the anhydrous condition not less than 99 percent(?) of $\text{Na}_2\text{B}_4\text{O}_7$. Each Gm. of sodium borate (weighed

in anhydrous condition) corresponds to not less than 9.704 mls of normal hydrochloric acid V. S. (if pure, 9.802 mls.) Preferably, take for the assay about 1 Gm. of the undried salt, and use for the titration tenth-normal hydrochloric acid. The equivalent for 1 Gm. of the fused salt will then be 97.04 mls of the volumetric acid. As limit of efflorescence, 1 Gm. of the salt when dried and heated to fusion must lose not less than 40 percent (42 percent) of its weight. Only colorless crystals should be official. In such cases it should suffice merely to require that the salt be kept in well-closed containers.

Sodii Phenolsulphonas. Dried at 120° C. the salt loses the whole of its water of crystallization (15.52 percent if pure). It should be thus dried before it is weighed for assay. It shows in the dried salt not less than 99 per cent of $\text{NaC}_6\text{H}_4\text{O}_3\text{SO}_3$. Each Gm. of dried sodium phenol-sulphonate corresponds to not less than 201.93 mls of tenth-normal bromine, V. S. (if pure, 203.97 mls). The official salt should consist of colorless transparent crystals and then if kept in well-closed containers it should not lose water sufficiently to affect the dosage.

Sodii Phosphas. This is really a very efflorescent salt. For assay as to purity, it may be dried to constant weight at 110° C. (if pure it loses 60.35 percent). Weigh about 0.2 Gm. of the dried salt and proceed as in the text. It shows in the dried salt not less than 98 percent of Na_2HPO_4 . Each Gm. of the dried salt corresponds to not less than 206.97 mls of tenth-normal silver nitrate, V. S. (if pure, 211.19 mls). The official salt must consist of clear crystals showing not more than traces of efflorescence. The effloresced salt is not to be dispensed unless first recrystallized.

Sodii Phosphas Exsiccatus. "It is a poor rule that does not work both ways," says the proverb. Sodium phosphate is keen to get rid of its water of crystallization. Equally eager is the exsiccated salt to attract to itself moisture from the air. In this case the U. S. P. IX requires that the former salt shall not be gratified in its self-abnegation beyond a certain narrow limit. In the other no objection is made to the acquisition of the water by the exsiccated salt, except that interposed by a well-closed container. However, there would seem to be a better plan than that of providing two forms of sodium phosphate so diametrically opposed in their behavior. There is an intermediate phosphate containing 7 molecules of water instead of twelve that is satisfied with its allotment of that compound. Why not make this one the official compound? Perhaps the simplest plan would be to dry the ordinary crystals until they had lost approximately 25 percent (25.145 percent) of their weight, requiring that when further dried to constant weight this salt shall lose approximately 47 percent (47.03 percent) of its weight. The assay for the determination of the purity would be the same as that for the present official salt and, for that matter, for the exsiccated sodium phosphate as well.

Sodii Thiosulphas. The crystallized salt when pure contains 36.29 percent of water of crystallization. Whether it can be brought to the anhydrous condition without decomposition is doubtful, but, if so, it is an easy matter to determine the purity of the sample by drying and titrating the residue with tenth-normal iodine, V. S.

If the plan of drying to constant weight is impracticable, the salt can still be brought to the form of sulphate and its weight compared with the theoretical yield of that salt. Only crystals should be official. These, when kept in well-closed containers in a cool place, are not liable to change materially.

Plumbi Acetas. It is stated that lead acetate loses its water at 40° C.; whether it also loses some acetic acid is not stated. Precaution would have to be taken against absorption of CO_2 if dehydration of the crystals should be attempted. Granted that this is practicable, the assay of the present text may serve for the determination of purity of the salt (rubric). The dehydrated salt being used, it shows in the dried salt not less than 99.5 percent (rather rigid) of $\text{Pb}(\text{C}_2\text{H}_3\text{O}_2)_2$. Each Gm. of the dried salt corresponds to not less than 61.20 mls of tenth-normal oxalic acid, V. S. (if pure 61.51 mls). The description calls for crystals of crystalline masses. If the crystals are transparent or translucent, showing not more than traces of efflorescence (or required to) and dissolve in recently boiled distilled water to a clear, or a most slightly opalescent solution, it seems hardly necessary to fix a limit of permissible efflorescence. It should be noted that the assay assumes complete solubility of the sample since the solution is not filtered before adding the oxalic acid, V. S.

If carbonate is present it counts in the assay as acetate. This is why care must be taken in drying the sample to exclude CO_2 .

Zinci Acetas. The salt is somewhat unstable as shown by its acetous odor. It is doubtful whether it can be deprived of its water of crystallization without material loss of acetic acid. The assay may be based upon the uneffloresced crystals, the salt being recrystallized if necessary. The water of crystallization is only 16.42 percent so that it hardly seems necessary to establish a maximum of permissible efflorescence. An article which is in uneffloresced crystals and conforms to the description given should be satisfactory. If the crystals have effloresced, the salt may be recrystallized from water containing some acetic acid.

Zinci Phenolsulphonas. The salt is said to give up the whole of its water of crystallization at 125° C. (25.94 percent, if pure). If the dried salt is used for assay, the amount of zinc oxide obtained corresponds to not less than 99.5 percent of the dried salt. Each Gm. of the dried salt corresponds to not less than 0.1967 Gm. of ZnO (0.1977, if pure). The salt should be used in uneffloresced condition. A standard of admissible efflorescence is not advisable, but it would be well in this case as in similar cases to ascertain what quantity of water the salt will normally lose under ordinary conditions, and, if necessary, make the official salt a "dried" salt not liable to undergo much change if kept under ordinary conditions.

Zinci Valeras. It is noticeable in the case of this salt that nothing is said about drying the sample before weighing. There is an obvious reason for this but if the assay is to mean anything, the official salt should at least always be in the crystallized form, and it would seem that under the circumstances (possible presence of notable quantity of moisture) a requirement of the equivalent of 99 percent of the crystalline salt is too stringent. An arbitrary requirement like this may be made but it does not call for a 99 percent "purity" of the salt.

SUMMARY.

The method of dealing with efflorescent salts adopted in the U. S. P. IX is faulty in several particulars.

I.—It appears to supply for such salt a rubric of purity but in fact does nothing of the kind. The words "Corresponding to not less than—percent of the crystallized salt" should in each instance be deleted as false and misleading. With this change the text furnishes a standard of "strength," which possibly is better than none.

II.—The exact limit for permissible loss of water of crystallization by efflorescence may seem in theory a desirable thing; in practice it can accomplish little good, while it is liable to abuse in the hands of over-zealous inspectors. The permitted loss in each case is approximately 5 percent so that a general statement in the introductory notices of the U. S. P. similar to that with regard to limitation of hygroscopic moisture (page xlvii near the bottom) would suffice.

III.—There seems to be a better plan. In nearly every case if the official salt is in crystalline form the efflorescence is readily discernable and it is easy to declare that only the uneffloresced salt is to be dispensed (or a salt showing not more than traces of incipient efflorescence).

IV.—In the exceptional cases where efflorescence is rapid and results in loss of more than 5 percent of the weight of the salt a different plan must be adopted. It may be that the salt can be induced to crystallize with a smaller proportion of water of crystallization, showing in that form a little or no tendency to effloresce. We have already substituted in the U. S. P. the monohydrated salt for the exceedingly efflorescent crystals of ordinary sodium carbonate, a capital improvement. It is possible that a sodium phosphate containing only seven molecules of water of crystallization may with equal advantage replace the present official salt.

V.—However that may be, it is certainly possible to substitute for the troublesome efflorescent salt the already effloresced salt. Of course, it would be necessary to fix a standard to which manufacturers would have to make their product conform. Such product would undergo but little change if kept in well-closed containers. Some of the European pharmacopoeias have made official a "dried salt" to be employed in the place of the crystals in mixtures in powdered form, *e. g.*, *Natrium Sulphuricum Siccum* and *Magnesium Sulphuricum Siccum* of the German Pharmacopoeia. Of course, the dried salt is very much stronger than the crystals, so that the one should not be substituted for the other, Gm. for Gm. This would not solve our problem, indeed, we have already exsiccated forms of sodium phosphate and ferrous sulphate but these again do not fill the bill. The exsiccated sodium phosphate, for example, is as greedy to absorb moisture as the crystallized is eager to part with it. The suggestion of an effloresced salt to take the place of both the other forms is at least worthy of consideration.

VI.—Finally there should be provided for each of the salts in question a true "Purity Rubric."

DELIQUESCENT SALTS.

Calcii Chloridum. A purity rubric for this salt is wanting. The only requirement is that "the salt without previous drying shall show the presence of not less than 75 percent of CaCl_2 ." The salt is described as "very deliquescent" and yet it is required to show on assay more CaCl_2 than it would contain if but one percent of hygroscopic moisture were present, the salt otherwise consisting of pure $\text{CaCl}_2 + 2\text{H}_2\text{O}$. A better requirement is that of the British Pharmacopoeia, *viz.*, "when dried at 200°C . the salt shall lose not more than 5 percent of moisture." Preferably establish a purity rubric perhaps of 99 percent. For the assay direct that the salt be dried at 200°C . before weighing, every precaution being taken to prevent absorption of moisture during the weighing. Proceed as in the text but the statement will read: "It shows in the dried salt not less than 99 percent of $\text{CaCl}_2 + 2\text{H}_2\text{O}$. Each mil of tenth-normal silver nitrate, V. S., corresponds to 0.007351 Gm. of $\text{CaCl}_2 + 2\text{H}_2\text{O}$ and each Gm. of calcium chloride corresponds to not less than 134.68 mils of tenth-normal silver nitrate, V. S. (if pure, 136.036 mils)." (Include also test like the B. P. limiting hygroscopic moisture.)

Calcii Bromidum. This case is closely analogous to that of calcium chloride, except that a somewhat larger percentage of impurity (presumably chloride) has to be tolerated. Probably a rubric of 98.5 percent would be reasonable. Then the assay would be conducted as in the case of calcium chloride, drying the salt at 200°C . before weighing. Then, "the assay will show in the dried salt not less than 98.5 percent of $\text{CaBr}_2 + 2\text{H}_2\text{O}$. Each mil of tenth-normal silver nitrate, V. S., corresponds to 0.011797 Gm. of $\text{CaBr}_2 + 2\text{H}_2\text{O}$. Each Gm. of calcium bromide corresponds to not less than 83.495 mils nor more than 85.536 mils of tenth-normal silver nitrate V. S. (if pure, 84.767 mils). (Also when dried to constant weight at 200°C . the salt loses not more than 4 percent(?) of hygroscopic moisture.)

Lithii Bromidum. It is very doubtful if it is practicable to dry this salt without loss of bromine. If it is, a rubric of purity may be fixed as in the case of calcium chloride, otherwise we may be contented with merely determining the percentage of lithium bromide as in the text, but only extraordinary precautions will prevent further absorption of moisture so that the salt will sooner or later fail to fulfil the U. S. P. requirement. Note that the text permits the presence of nearly 1 molecule of water (one molecule = 17.18 percent).

Zinci Chloridum. A purity rubric is perhaps impracticable owing to the tendency of this salt to form oxychloride. The present assay may, therefore, be accepted as sufficiently safeguarding the purity of the product. Possibly 95 percent is too high a requirement. At all events it is evident that care must be exercised in selecting a fair sample for weighing. Instead of taking 0.3 Gm. as the text prescribes, we should start with a much larger sample, not less than 2.5 Gm., of which, after dissolving and making up to a definite volume, an aliquot corresponding to 0.3 Gm. of the original sample may be taken for assay.

MISCELLANEOUS COMMENTS.

Ammonii Iodidum. It is stated in the text that the salt soon becomes yellow or yellowish brown on exposure to air and light, but nothing is said of its unfitness for use in this condition, or of any remedy. It would seem that merely drying it at a temperature of 110°C . should render it fit for dispensing.

Antimonii et Potassii Tartras. The salt is efflorescent, therefore it should be rendered anhydrous for the assay by drying it to constant weight at 110°C . The dried salt shows not less than 98 $\frac{1}{2}$ percent(?) $\text{K}(\text{SbO})\text{C}_4\text{H}_4\text{O}_6$. Each mil of tenth-normal iodine, V. S., is equal to 0.016167 Gm. of $\text{K}(\text{SbO})\text{C}_4\text{H}_4\text{O}_6$. One Gm. of the dried salt requires 60.93 mils of tenth-normal iodine, V. S. (if pure, 61.856 mils).

Ferri et Ammonii Citras. In this and in the next item, the description "Ferric citrate rendered more readily soluble by the presence of ammonium citrate" is objected to. It seems hardly true to say that the product is ferric citrate when it is really a chemical compound (no doubt), of which ferric citrate is a constituent. It is true that the new compound is more soluble (in water) than ferric citrate alone and that pharmaceutically this gives it an advantage over the less soluble salt, but the definition is surely faulty—still more so in the case of *ferri et ammonii citras*, where the term "iron citrate" is used instead of ferric citrate. Is not iron and quinine citrate in itself a chemical individual, which is converted into a more soluble group by the further combination with ammonium citrate?

Ferri Phosphas. The comments on *Ferri et Ammonii Citras* apply equally well here.

Zingiber. It would be advisable to refer to the pages in the Pharmacopoeia where the special method for determining non-volatile extracts are given.

Tinctura Zingiberis. The following criticisms have been received: The requirements for tincture of ginger are open to the following criticisms: First, contrary to pharmacopoeial usage in case of fluid preparations, the assay is based on a weighed instead of a measured quantity of the tincture. Ten mils, rather than 10 Gm. of the tincture should be taken and the weight of the residue should not exceed 0.165 Gm. (corresponding closely enough with 2 percent). Second, a minimum requirement as to extractive is at least as important as a maximum, for reasons quite obvious. Third, the expression "when treated with 20 mils of cold distilled water" is too vague. The directions should be to "stir the residue with a glass rod during five minutes with 20 mils (or 16 mils as the case might be) of cold distilled water. Decant the water into an evaporating dish and rinse the residue with two mils of distilled water without further stirring. Evaporate to dryness and dry to constant weight at 100° C. or, perhaps better, dry the residue once more and determine the loss." Twenty percent, is suggested as a more reasonable allowance than fifteen in any case. Perhaps after all a requirement that 90 percent of the alcoholic extract should be soluble in ether would probably be more to the point than the requirement as to water solubility.

CAUTIONS AGAINST INJURIOUS EFFECTS OF PHARMACPOEIAL ARTICLES.

Dr. A. B. Lyons submits the following comments: The Pharmacopoeia deals with many poisonous and corrosive substances. Is it in place to point out the dangerous properties of drugs? It seems only right that a book like this should keep before the minds of those who use it the distinction between active poisons and drugs of little potency. The former should surely be kept by themselves under lock and key and this should be specifically required in each instance. Such a practice is recommended in a number of the pharmacopoeias of other countries and should be universal. Our pharmacopoeia avoids mention of the word "poison." It does not even indicate the maximum permissible dose of such a potent agent as strychnine, an omission not less than criminal.

It does now and then, however, print in italics a cautionary sentence interpolated usually in the descriptive paragraph. Under Phosphorus, for example, it is stated that the drug "*has a distinctive and disagreeable odor and taste but should not be tasted except in very dilute solution.*" Italics are those of the text. (Imagine a greenhorn taking a bite of phosphorus to find out how it tastes!) Mention is made of the spontaneous ignition of phosphorus on long exposure to the air and instructions are given to preserve the drug under water in strong well-closed containers in a secure and moderately cool place, but the words are not italicized or given prominence in any way. One would look for some such expressions standing out conspicuously on the page as "dangerously poisonous" or "exceedingly poisonous and extremely inflammable, liable to spontaneous ignition if not kept under water, producing burns exceedingly painful and difficult to heal." We find under Sodium Arsenate, "great caution must be used in tasting it and then only in very dilute solution." (Will someone please parse that sentence?) There is, however, no word of caution under Arsenic Trioxide or even under Solution of Potassium Arsenite.

It is said of Phenol (not italicized) that when undiluted it cauterizes the skin and mucous membrane, language which fails to convey an adequate warning against the deadly effects of this insidious poison.

There are cautions against carelessness in handling calcium hypophosphite and other hypophosphites and so with potassium chlorate where italics are used, but nothing is said of the reaction with strong mineral acids; potassium permanganate "when in solution or in the dry condition must not be brought into contact with organic or other readily oxidizable substances." The idea seems to be merely that the permanganate would be decomposed, with no suggestion of anything like an explosion.

The scope of my criticism is that cautionary expressions are employed in rather a haphazard way. They should be reduced to a system. My idea is to have a definite place under each title for a statement regarding the poisonous character of the drug (if poisonous) characterizing it as: "An exceedingly potent poison," "an active poison," or "a poison," and in each case, preferably inserting a descriptive adjective as "narcotic," "irritant," "corrosive," etc.

The introductory notices should define the uses of the terms "potent" and "active." Similarly, I would, when necessary, introduce a cautionary note with regard to any special care required in handling the article. This naturally would come in connection with the directions "in well-closed containers," etc.

L. D. HAVENHILL, *Chairman.*

Committee on Publication: J. W. ENGLAND, *Chairman*; G. M. BERINGER, CASWELL A. MAYO, H. B. MASON, E. L. NEWCOMB, and the Editor-in-Chief of the JOURNAL, General Secretary, Treasurer and Reporter on the Progress of Pharmacy, *ex-officio*.

Editorial Office: 253 Bourse Building, Philadelphia, Pa.

HEARING ON THE EDMONDS BILL.

We have been advised by Congressman George W. Edmonds that a hearing would be had on the Edmonds Bill next Tuesday, March 19th, at 10.30 A.M. It is to be hoped that the result of this hearing will prove entirely satisfactory, although it must be admitted that from certain sources there is opposition, which possibly may be overcome, or not of sufficient strength to impede action on this much-needed measure.

FAIRCHILD SCHOLARSHIP EXAMINATION TO BE HELD JUNE 25, 1918.

THE AWARD THIS YEAR TO BE MADE TO A GRADUATE PHARMACIST.

The Fairchild Scholarship Committee has named June 25, 1918, as the date for holding the Fairchild Scholarship Examinations. The award this year is to be made to a graduate pharmacist. It is the desire to determine how the award of the Fairchild Scholarship can serve to the greatest advantage of pharmacy and when this has been determined the Scholarship will be awarded each year on that basis. Schools of pharmacy are asked to make the announcement in the class-rooms and through other means of publicity. The Scholarship is to be awarded to a student of one of the Conference schools.

RECONSTRUCTION PROBLEMS.

A DRUG TRADE COUNCIL.

It is very evident that the thought of federation of various drug industries is a topic of discussion not only in this country but also in Great Britain. Reference has heretofore been made editorially relative to the address of President C. A. Hill, of the British Pharmaceutical Conference, in which he outlines a plan of federation and this subject is discussed in the *Chemist and Druggist* for February 2, 1918, on pages 43 and 44, and is quoted in full:

"There exists at the present time no one body which can speak with authority for the whole of the (British) drug trade. There are

times, however, when it is desirable that some representative body should be able to place the views of the drug trade as a whole before Government Departments or when such a body should be available to be consulted by the Government when any step in legislation affecting the drug trade is being taken. The Pharmaceutical Society of Great Britain and the Pharmaceutical Society of Ireland may be taken to represent retail chemists; the Drug Club, wholesale druggists; the Proprietary Articles Trade Association, a section of the makers of proprietary articles; the Pharmaceutical Committees (imperfectly federated in the Local Associations Executive) and the General Council of Panel Chemists (Scotland), the interests of panel chemists; the British Pharmaceutical Conference, the scientific side of the drug trade; the Society of Chemist-Opticians and Chemists' Dental Society, those sections of the trade interested in optics and dental work; the Public Pharmacists' and Dispensers' Association, those dispensing in public institutions; the Chemists' Assistants' Association, the interests of assistants; and over 200 Associations, some of which are federated, local interests. No one of these bodies can, however, give an authoritative opinion on a matter affecting the whole trade.

There have been occasions when such an opinion was required, and there will be many in the near future. As an example may be quoted the difficulties that arose in regard to the proposals for the abatement of duty on medical spirits where the medical men's and dispensers' views only were placed before Parliament with the consequence that the effect had to be modified afterwards by inter-Departmental conferences.

Mr. C. A. Hill, the President of the British Pharmaceutical Conference, in his address at the July meeting last year emphasized the need of what he designated a Public Policy Committee which could coördinate, and amalgamate the views of the craft as a whole. It will be remembered also that in what is known as the Whitley Report of the Sub-

Committee on the relations between employers and employed the formation was urged of Joint Standing Industrial Councils representing each trade. Among the questions which it is proposed that these Councils should undertake are those of technical education and training, industrial research, and the consideration of legislation affecting the industry. There has recently been instituted an Industrial Reconstruction Council for the purpose of assisting trades to form the representative bodies referred to, so that it may be taken that the Government is in earnest in this matter. We know that the need has already been felt for a representative body which can be called in for consultation. We hazard the opinion also that the absence of such a Council in the past is perhaps one of the reasons why the Government appears constantly to disregard the views of any one of the Societies representing sections of the drug trade. The difficulty arises at once that the Pharmaceutical Society, which has been provided with a handsome income by the State, takes a narrow view of its responsibilities and is extremely jealous of any other body which may appear to encroach on its preserves. But for these characteristics the matter would have been easy of accomplishment. As it is, it is not unlikely that the Ministry of Reconstruction will require to take in hand the organization of the drug trade. It would be much better, however, if the initiative came from within. The starting point is the formation of a real Federation of Local Associations and of Pharmaceutical Committees. Some parts of the country are already federated areas of Local Associations and a reconstituted so-called Local Associations Executive Committee could be made really to represent the Pharmaceutical Committees from which it draws the money which pays the Committee's expenses. These bodies and the Pharmaceutical Societies would appoint members representing retail chemists to the Drug-trade Council and the wholesale druggists represented in the Drug Club and the Association of Wholesale Druggists could arrange delegates to represent their section. The Whitney Report to which we have referred is largely concerned about the relations between employers and employed, and for this reason the various Chemists' Assistants' Associations would need federating and representing on the Trade Council.

We understand that the Industrial Reconstruction Council is willing to assist in bring-

ing together the different elements of a trade and to arrange a meeting. There will in the near future be many problems for the Trade Councils to solve, and those trades will suffer which are not in a position to represent their views to the Government. It is necessary first to consider what bodies should be represented on the Council and the manner of the election of delegates.

We have not attempted to give a complete list of representative Societies and Associations, but the test in this case is that the Association represents definite interests of persons connected with the drug trade. Looking still further forward in this matter of State recognition, to the formation of a representative Upper House in the Parliamentary system of this country, it is probable that the drug trade would be in a position through its Council to claim a seat there, and thus ensure that the views of the drug trade would be heard in legislative proposals—a far better idea than spending money in the attempt to obtain the election to the House of Commons of representatives of sectional interests.

PROSPECTIVE PHARMACY STUDENTS SHOULD NOT UNNECESSARILY NEGLECT THEIR OPPORTUNITIES AT SCHOOL.

Dr. Claxton, United States Commissioner of Education, has said that "no student should leave college now and none should leave for war service but every man should remain until definitely called. When the Government wants him it will call him."

The leading reason for this statement is that according to the views of Dr. Claxton the war will be a long one. Four whole classes of doctors have simply dropped out of this generation in European countries because of their enlistment. That which applies to medicine is also applicable in a degree to pharmacy. While, of course, there is no intention to keep any one from doing his duty as a citizen, there are doubtless many who enlist in advance of the call and are at present students in colleges of pharmacy. What applies to the latter in a degree also obtains with those who contemplate studying pharmacy. The schools should be kept filled as far as possible and to that end the efforts of the schools to persuade young women to enter pharmacy is timely.

Unfortunately, no provision has been made for exempting pharmacists as has been provided for medical and dental students.

A NATIONAL DUTY.

The Treasury of the United States has a great deal of money to raise and it cannot be raised by bankers alone, says Secretary McAdoo. The banks of this country can not alone sustain America's needs in this war and extend to our allies the essential aid which they must have to continue the war.

The rich of this country can not do it alone; the men of this country can not do it alone; the women of this country can not do it alone; but all of us, the people of the United States, disregarding partisanship, forgetting selfish interests, thinking only of the supremacy of right and determined to vindicate the majesty of American ideals and secure the safety of America and civilization can do the great and splendid work which God has called upon us to do.

THE SUPPLY OF SUGAR.

In reply to many inquiries that are being received regarding the sugar supplies for manufacturers of essential foods product, and appreciating, as we do, the necessity of both production and preservation of food supplies, as well as reflecting the policy of the Food Administration as bearing upon collateral industries such as manufacturers of cans and fruit jars, etc., and buyers of same, all manufacturers of essential food products are advised that they will be able to obtain their full necessary requirements of sugar for manufacturing purposes during the coming season.

This applies particularly to the packers of fruit, condensed milk, and such vegetables for the preservation of which sugar may be necessary, as well as to the housewives for usage in preserving purposes.

As soon as the car shortage is relieved, supplies of sugar will be available for the necessary preservation purposes. Shipments from Cuba are steadily increasing.

Dr. H. M. Whelpley has completed his thirtieth year as editor of *Meyer Brothers*

Druggist, and the January number of that publication commemorates the event by a large issue in which printers art has been advantageously displayed. There are a number of interesting and historical articles, devoted to the growth of St. Louis as a drug and chemical market.

Mrs. Alonzo B. Stevens, wife of the dean of the University of Michigan College of Pharmacy, died February 6th, at Loma Linda, Cal. Mrs. Stevens had been sick for some time. During prior years Mrs. Stevens accompanied her husband to the annual conventions of the American Pharmaceutical Association.

Henry S. Wellcome, of Burroughs, Wellcome & Co., and member of the American Pharmaceutical Association since 1875, presented the British War Office a completely equipped motor bacteriology laboratory.

C. F. Ramsay, a frequent contributor to the Scientific Section, A. Ph. A., is now consulting chemist for Brewer & Co., of Worcester, Mass. For the past eight years Mr. Ramsay was engaged with Parke, Davis & Co., of Detroit.

Frederick Remington, nephew of Prof. Jos. P. Remington, deceased, a wireless operator on one of the American destroyers, has been singled out by the War Department for special commendation, for his conspicuous bravery in a recent engagement with a German submarine. The commendation assigns "efficiency, devotion to duty and gallantry in action in accord with the best tradition of the service."

Frank L. McCartney, president of the New York Branch of the American Pharmaceutical Association, has been appointed Captain in the U. S. Sanitary Corps and is now stationed in the Medical Supply Depot of New York. The Albodon Company, with which Mr. McCartney is associated, has given him leave of absence during the duration of the war.

OBITUARY.

ALFRED BIRCH HUESTED.

Dr. Alfred B. Husted, professor of materia medica and botany in the Albany College of Pharmacy from 1883 until last November, died at his home in Delmar, February 23rd. The deceased was born in Clifton Park, N. Y., May 15, 1840. At an early age he came to Albany where he made his home until 1910, when he moved to Delmar.

His early education was received in the public schools of Albany and the Albany Boys' Academy. When sixteen years of age he entered the drug business of Dexter & Nelliger, remaining with this firm until 1859 when he began the study of medicine. In 1862 he volunteered for United States Service as hospital steward. During the winter of 1863-1864, he was given a short leave of ab-

sence, when he returned to Albany and passed his medical college and state board examinations and was thereafter commissioned a first lieutenant and assistant surgeon in the 21st New York Cavalry. After the war he returned to Albany, where he opened a drug store at Hudson Avenue and Eagle Street. In 1886 he established the firm of A. B. Husted & Co., from which firm he retired several years ago.

Dr. Husted was a member of the first State Board of Pharmacy of New York and was president for sixteen consecutive years. Dr. Husted was a member of the Masonic bodies and retained considerable interest in the G. A. R., of which he was a member. Even at his advanced age he was active and always of a jovial disposition. He was remarkably well preserved both in mind and body and thoroughly in love with his work. Mrs. Husted survives the deceased and also three sons and three grandsons.

Dr. Husted was president of the New York Pharmaceutical Association from 1880 to 1884 and joined the American Pharmaceutical Association in 1879. He and Mrs. Husted have been quite regular attendants at the annual conventions of the Association.

E. G. E.

ABSTRACT OF A TRIBUTE BY PROF. G. V. DILLEN-
BACK ADOPTED BY ALBANY COLLEGE OF
PHARMACY

Alfred Birch Husted, M. D., Ph. G., Secretary and Professor of Botany and Materia Medica of the Albany College of Pharmacy, passed away February 23, 1918. The faculty and college have suffered an irreparable loss. Mature in wisdom, gentle in manner, firm but not aggressive, and daily sacrificing his own opportunities for the happiness and welfare of others, his death leaves a void not easily filled in the college, in the world of pharmacy and in society. He had few equals as a teacher. His training had peculiarly fitted him for the work that was to round out his life. * * * *

He was the friend of everybody and beloved by all and his memory will ever remain fixed in the minds of his associates and the hundreds of alumni who have finished under his instruction. It was not alone his teaching ability but his genial manner and even disposition which endeared him to all, since his presence created an atmosphere of cheer and happiness.

It was ordered that this memorial be entered in full upon the minutes, and that a copy of the same be transmitted to the family of the

deceased with an expression of heartfelt condolence on the part of the members of the faculty and that it be published in one of the newspapers of the city.

WILLIS G. TUCKER,

Dean.

IN MEMORY OF JOSEPH P. REMINGTON.

(Continued.)

FRANK CAIN.

I have always found Professor Jos. P. Remington a loyal friend for democracy in the profession of pharmacy. In the fight for educational freedom of all druggists, no better faith could be exemplified in the brotherhood of man, than the great spirit of fraternalism of Prof. Remington.

He had an abiding faith in education and the ultimate victory which education would bring for the uplift of pharmacy to a level equal to that of any other profession. All his cherished hopes will yet be realized—for the life-work of Prof. Remington will grow to a full materialization of all that is good for American pharmacy.

In memory of Prof. Remington it may be said: He was true to work and true to men: two characteristics which made him possessed of a noble fidelity. His superior knowledge, his work, his moral courage combined with simplicity, gave him gentlemanly dignity. He is highest who stoops to lift up the right above the wrong; therefore, he was our leader. Friends from every walk of life will miss Professor Remington, but pharmacists suffer a severe loss.

WILLIAM B. DAY.

When the history of American Pharmacy is written, Joseph Price Remington will, by common consent, be accorded the highest position among the pharmacists of his time. Thoroughly versed in the practice of his profession, he was at once a teacher of rare ability and a peerless leader of men. His winning personality gained for him a legion of friends to whom his life will be an inspiration and his memory a benediction. It may well be said of him as was said of the poet: "None knew thee but to love thee; none named thee but to praise."

JOHN C. WEYER.

Charles A. Apmeyer, Secretary of the Cincinnati Branch, A. Ph. A., reports the death of John C. Weyer, well-known Cincinnati pharmacist at the age of 79 years. Mr. Weyer died January 28th, and Mr. Apmeyer speaks of

him as a sturdy, true friend, a gentleman of high attainments, a firm advocate of better education for pharmacists, always striving by his individual efforts to place his much loved profession, pharmacy, upon a higher and more scientific plane. Pharmacy deplors the loss of one of her loyal sons.

He was a director of the Cincinnati College of Pharmacy and served as president of the Ohio Board of Pharmacy. He conceived the idea of druggists' fire insurance and twenty-eight years ago organized the Retail Druggists' Mutual Fire Insurance Company, of which he was manager.

SOCIETIES AND COLLEGES.

AMERICAN DRUG MANUFACTURERS' ASSOCIATION.

SEVENTH ANNUAL MEETING.

As president of the American Conference of Pharmaceutical Faculties, Professor Kraemer personally acted as the delegate and delivered a message of great importance for the development of pharmacy at the present time. The Association believes that it will strengthen the work of the university schools as it outlines a program for the future. During recent years there has been considerable pressure to introduce into the curriculum of the college courses a vast amount of ordinary commercial teaching. On the other hand, there is a strong tendency on the part of very many students attending the universities to extend their time until they become proficient in original research. The only deterrent to these advanced students has been the question as to whether the manufacturers would avail themselves of the abilities of these especially trained men. The expression of very many of the American Drug Manufacturers is that they are in need of such men and that they would provide every facility at their disposal for the development of original research and that they would amply reimburse these investigators in their laboratories for any discoveries of merit which they might make.

In concluding Dr. Kraemer said:

"It does not require much thought as we consider the permanency of institutions to come to the conclusion that (1) mankind will always require medicines; (2) that drug manufacturers will supply the remedies; and (3) the universities must train the experts who are the back-bone of our pharmaceutical industries. It is self-evident, therefore, that the men who are teaching the youths of our country, and are to take the places of your chemists and investigators, and assist you in continuing your establishments, ought to be practically conversant with the direction that the manufacturing industry in which you are engaged is developing. I am grate-

ful to you for the encouragement I have received and for the message I can deliver to my colleagues of the American Conference of Pharmaceutical Faculties. The universities will not and must not fail you at this critical period in the world's history when mankind is looking to the properly trained men of our country for the means of prolonging and preserving life.

SOME OF THE RESOLUTIONS ADOPTED AT THE AMERICAN DRUG MANUFACTURERS' ASSOCIATION.

PATENT LEGISLATION.

Resolved, That the American Drug Manufacturers' Association hereby reaffirms its opposition to any patent legislation discriminating against medical, chemical and pharmaceutical discoveries.

POWERS OF DELEGATES TO N. D. T. C.

Resolved, That it is the sense of this Association that whenever all the delegates to the National Drug Trade Conference are unanimous upon a question of legislation before the conference for decision and action, that our delegates be empowered to act and vote according to their best judgment on that question.

REPORT ON PROGRESS OF CHEMISTRY, PHARMACY AND BIOLOGY.

Resolved, That realizing and appreciating that an association of the size and importance of this Association should, as part of its annual work, present a concise, interesting résumé of the progress that has been made in the scientific and industrial branches of chemistry and pharmacy and in consequence of a recommendation of our Committee on Standards and Deterioration, your Executive Committee recommend the appointment by the President of a reporter upon the progress of chemistry and pharmacy and biology, who shall present at the next annual meeting a concise interesting account of what has transpired in the past year.

UNAVAILABLE DRUG SUPPLIES.

WHEREAS, It has been found that certain drugs and chemicals of the U. S. P., such as, for example, scammony root and resin, have not been available for some time past for manufacturers and the drug trade, and

WHEREAS, Certain other drugs and chemicals, as, for example, Mexican scammony root and resin, can be used effectively and are generally admitted to be as valuable and effective as those not available; and

WHEREAS, Government war orders for medicines are being delayed because of the absence of these official drugs from commerce now; therefore be it

Resolved, That this Association urgently request the U. S. P. Revision Committee make official these available and at present unofficial drugs and chemicals, such as those above referred to, at the earliest possible moment.

LAWS APPLYING TO PHARMACY SHOULD BE ADMINISTERED BY PHARMACISTS.

Resolved, That medicine and pharmacy are sister sciences, each having its proper and peculiar function to perform in the conservation of health and life; that these functions, while coöperative, are independent; that it is the function of medicine to diagnose and prescribe and that pharmacy cannot respect the views of particular factions in the medical profession without invading this function by denying to others the means of treating the sick by those methods and medicines they prefer. The American Drug Manufacturers' Association therefore deprecates any political activity on the part of physicians or pharmacists seeking the placement of men of particular views in official positions or connections for factional purposes as unfair and debasing to both medicine and pharmacy.

The Association is therefore in hearty sympathy with the opinion expressed by Prof. James H. Beal that there is no better reason why laws applying to druggists should be interpreted by physicians than that laws applying to physicians should be interpreted by druggists; and be it further

Resolved, That it is the opinion of this Association that laws applying to pharmacy should be administered by men trained in pharmacy.

DESIRABILITY OF FEDERATION OF DRUG INDUSTRIES.

It is hereby *Resolved* by the American Drug Manufacturers' Association that it approves

the desirability and wisdom of organizing and federating pharmacy and the drug interests of this country as conducive to the best interests of pharmacy and all said drug interests; and it is further

Resolved, That this Association appoint three delegates, when invited to do so, to attend a conference of all the national drug associations when this may be called and report back to this Association the results and conclusions of said federation conference for subsequent action by this Association.

SHERMAN ACT SHOULD BE REPEALED.

WHEREAS, the Sherman Act as construed by the courts is so far reaching as to prevent harmless coöperation of kindred industries in the prosecution of the great war in which we are now engaged; and

WHEREAS, The Clayton Act and the Act creating the Federal Trade Commission effectually control the evils reached by the Sherman Act; and

WHEREAS, Said Acts are enforced by the Federal Trade Commission clothed with powers which enable it to determine promptly and in advance whether any proposed combination for coöperation is in under restraint of trade or not; therefore be it

Resolved, That it is the sense of the American Drug Manufacturers' Association that the Sherman Act should be repealed.

REVISION OF PRICE LIST NOMENCLATURE.

Resolved, That this Association heard with interest the suggestion by the Committee on Standards and Deterioration that a revision of the nomenclature of our price lists and labels would be desirable and advantageous to the physician, manufacturer, jobber, retailer, and patient and recommends that the question be referred to the incoming Executive Committee for its careful consideration and action.

ANTI-NARCOTIC LEGISLATION.

Be it Resolved that the Association reiterate its position that the Harrison Anti-Narcotic Law has been remarkably efficient in reducing the illegitimate use of habit-forming drugs and only requires amendments restoring the possession clause in Constitutional form and making certain changes in the Exemption Section, notably, one removing the exemption on Paregoric; and be it further

Resolved, That the resolutions of the Joint Conference held last April at the suggestion

of this Association be endorsed in the form which they took when revised by the National Drug Trade Conference.

ENDORSE WAR SAVING STAMPS.

Resolved, That this Association recommends to its members the active support of the United States War Saving Stamp Movement in the belief that this means of contributing to the support of the War makes possible the utilization of both small and large savings and encourages thrift among small wage earners.

AFFILIATION WITH METRIC ASSOCIATION CONTINUED.

Resolved, That the Association continue the affiliation with the American Metric Association; and be it further

Resolved, That it is the sense of this organization that the adoption of the metric system must come not by arbitrary legislation, but by a gradual adjustment as the people become educated to it and as equipment and materials based on present standard need to be replaced; and be it further

Resolved, When the size of label permits, we recommend to our members that the metric equivalent be stated thereon.

WAR SERVICE COMMITTEE.

WHEREAS, It became necessary during the past year for your Executive Committee to name a War Service Committee to represent the manufacturers of pharmaceuticals and medicinal chemicals, and be the means of touch of the Government with said manufacturers during the war; and

WHEREAS, It appeared to your Executive Committee that each branch of the drug industry should be represented by its own war service committee; and

WHEREAS, The Committee thus named has since been officially recognized by the War Service Executive Committee of the U. S. Chamber of Commerce; therefore be it hereby

Resolved, By the American Drug Manufacturers' Association that such actions of the Executive Committee be the same and are hereby endorsed by this Association with the understanding that the size of this Committee may be enlarged by the incoming President of this Association.

AFFILIATION WITH N. D. T. C. AND C. C. OF U. S. Continued.

Resolved, That the Association continue its affiliation with the National Drug Trade Conference and that the proper officers be and are

hereby instructed to pay its assessment of \$50.00.

Resolved, That the Association continue its affiliation with the Chamber of Commerce of the United States of America.

PHILADELPHIA COLLEGE OF PHARMACY.

Prof. Charles Herbert LaWall, heretofore associate professor of Pharmacy, has been elected dean of the Faculty of the College, to succeed the late Prof. Joseph P. Remington. Dean LaWall has been intimately associated with the college in a teaching capacity for nearly eighteen years. He has also been nominated for the full professorship of the Course in Theory and Practice of Pharmacy, and Prof. E. Fullerton Cook for the full directorship of the Pharmaceutical Laboratories.

Prof. Julius W. Sturmer, at the same time, was elected dean of the Post-Graduate and Special Courses, which include the bacteriological and microscopical departments. Prof. Sturmer, until the recent amalgamation of the two colleges, was dean of the Department of Pharmacy of the Medico-Chirurgical College.

Prof. Frank X. Moerk has been elected director of the Technical Chemical Courses. Professors LaWall, Sturmer and Moerk constitute the new executive officers of the faculty. At the invitation of the board of trustees of the College, the new executive officers will hereafter be present at all meetings of the board and will take active part in its deliberations.

Each month takes its toll of students from the class roll. At the last report the number of students and last year's graduates in military or naval service has reached over the two hundred mark.

In line with the nation's food conservation program, the customary annual banquets of the class organizations and fraternities have been temporarily postponed.

President Howard B. French is serving in an official capacity as chairman of one of the committees dealing with the housing problems near the Government's new shipbuilding plants in the League Island district.

UNIVERSITY OF KANSAS, SCHOOL OF PHARMACY.

Dean Sayre of the Kansas School of Pharmacy, advises that the Chamber of Commerce of Lawrence has adopted a resolution favoring

the creation of a pharmaceutical corps in the Army. The resolution follows:

Resolved, That the Chamber of Commerce of Lawrence, Kansas, interested in the promotion of all projects for the advancement of national as well as local welfare, join the pharmacists of Lawrence and the faculty of the School of Pharmacy of the University of Kansas, in urging the passage of the Edmonds Bill H. R. 5531, convinced that the establishment of a pharmaceutical corps in the U. S. A. will greatly increase the efficiency of the medical service of the army—whereby dispensing of medicines will be in the hands of trained men skilled in this coordinate branch of medicine. The establishment of this proposed corps will measurably relieve the already overburdened physicians and surgeons

so that they may devote their special attention and care to the treatment of our soldiers in the various hospitals.

TEMPLE UNIVERSITY, DEPARTMENT OF PHARMACY.

In the November issue, 1917, on page 987, school 53, item 3, an error was made. This should have been 45 instead of 11. In justice to Secretary Jordan, it should be said that the error occurred in the Journal Office, the ditto mark of a pencil copy being taken for the figure 11, whereas it should have referred to the prior statement "that this report was made before commencement and hence the number of graduates could not be given." Since this time Dean John R. Minehart has given us the number of graduates which, as indicated, was 45.

THE PHARMACIST AND THE LAW.

FEDERAL EXPLOSIVES LICENSES.

An Act of Congress (*Public Document No. 68, Sixty-fifth Congress*) to prohibit the manufacture, distribution, storage, use and possession in time of war of explosives, and the ingredients thereof, provides that a license from the Bureau of Mines is necessary for every person, firm or corporation, to purchase, possess, sell or use, any explosive or the ingredients thereof.

1. It is necessary for pharmacists and druggists to make application for such a license.

2. It is necessary for institutions of learning, for instance, colleges, high schools, etc., to make application for said license.

A chemist conducting a commercial laboratory must make application for the license, if any of the enumerated substances are on hand in quantities of one ounce or over.

Any violation of this Act is punishable by a fine of not more than \$5,000 or by imprisonment of not more than one year, or both fine and imprisonment.

The Bureau of Mines has published the attached list of articles requiring licenses under this Act.

The purchase, possession, sale or use of any one of the ingredients herewith listed below in amounts of *one ounce or over* requires a Federal Explosive License.

Bichromates: ammonium, potassium, sodium; chlorates: barium, potassium, sodium, strontium; chromates: ammonium, barium, calcium, chrome green, chrome yellow, lead, potassium, sodium; nitrates: ammonium, barium, copper, ferric, lead, magnesium, nickel,

potassium, silver, strontium; nitric acid: aqua fortis, fuming, nitric acids of all grades and strengths, mixed acids; perchlorates: perchloric acid, potassium; perborates: magnesium, sodium, zinc; permanganates: calcium potassium, sodium; peroxides: barium, calcium, magnesium, oxon (cubes and cartridges), sodium, strontium, zinc; phosphorus.

FLOOR TAX ON ALCOHOL HELD TO HAVE BEEN ILLEGALLY ASSESSED.

The floor tax on alcohol to be used for non-beverage manufacturing purposes has been declared illegal.

In a comprehensive opinion rendered by Attorney General Gregory, the assessments, made by collectors, on alcohol in the possession of manufacturers of drugs, medicine, perfumery, toilet articles, etc., at the time the war revenue act of October 3, 1917, became operative, were illegally assessed. The tax amounted to \$1.10 per proof gallon.

RULINGS UNDER WAR REVENUE LAW.

The following additional regulations applying to medicinal and toilet articles were furnished to the N. W. D. A. by B. C. Keith, Deputy Commissioner, of Internal Revenue under date of January 25, 1918.

Where toilet preparations or proprietary preparations of a medicinal character are prepared by a retail dealer on his own premises and sold exclusively to his own customers, such a dealer manufacturing his own products is regarded under the Act as a manufacturer and will be required to pay the tax.

Where a medicinal preparation is "held out

or recommended" as a remedy, even though such recommendation is intended for physicians only, it is a holding out to the public through the physician and is subject to the tax imposed.

Where medicinal preparations are sold under labels which do not indicate that the formula is published, they will be construed to be prepared under secret formula, unless affidavit or other evidence is submitted to show that the formula is not a secret.

Preparations made in accordance with formulas, contained in the United States Pharmacopoeia and National Formulary by pharmaceutical manufacturers and druggists having no special proprietary right to such formulas, and bearing printed labels giving direction as to use, when not held out or recommended by the manufacturers, vendors, or proprietors as proprietary preparations, or as remedies, or specifics for any disease or affection, are not taxable under paragraph (h), Section 600.

If there is not any claim or indication that a medicinal preparation is proprietary and no disease or affection is named for which it is claimed that the medicine is a remedy, the tax does not attach.

Where a medicinal preparation is advertised under the name or initials of the manufacturer, or if any name in the possessive case is used on the label or on literature describing the preparation, the tax is imposed.

A retail dealer, manufacturing a patent medicine by a private formula, is subject to the "manufacturer's" tax even though he sells such a product only in his retail store.

SUGGESTIONS FOR THE CONSERVATION OF SUGAR USED IN THE MANUFACTURE OF SODA FOUNTAIN BEVERAGES.

The letter following was received by Secretary F. E. Holliday, of the N. W. D. A., from W. T. Harper, Ottumwa, Ia. Such procedure, as recommended, would require the consent of Federal and State authorities. Under the circumstances regulations authorizing the manufacture, as a conservation measure, might perhaps be provided, but until then, in our opinion, would be inadvisable. The letter reads:

"The writer's connection with the Food Administration has brought home for more serious thought some things in connection

with our business in which a great many of our members will be interested.

"We understand there is now being taken data from the owners of soda fountains as to the quantity and kind of materials used in serving soft drinks. We were already aroused to the fact that the campaign for decreased consumption is being waged all over the country. A lot of sugar is used in soda fountain drinks and soft drinks of all kinds. A lot of sugar is necessary, but there is a lot of it that is wasted.

"The question in our mind is, will this be permitted and will soda fountains and soft drinks be considered as non-essentials and eliminated from business?

"The elimination of any business as a non-essential is a serious problem and the Administration will probably hesitate before doing this. The loyal support, however, of any such business to the Administration will help that business and help the Administration wonderfully.

"In giving this matter consideration we have felt that the owners of soda fountains should eliminate sugar syrup either in the form of rock candy syrup or syrup by percolation from sugar as much as possible. This can be done by using a certain amount of glucose. The quantity of syrup used in any drink has been too much at most places for the profit of the retailer and for the good of the consumers, but it tickles their taste to have a sweetened drink and hence it has been abused.

"Now, the same amount of syrup can be given but it can be given in a different form, will not use as much sugar and will not be quite as sweet. This syrup can be made by using two parts of rock candy or sugar syrup, one part of glucose and one part of distilled water. This will eliminate 50 percent of the sugar used, would still give them a sweetened drink and would reduce the cost to the dispenser.

"We have investigated this matter and find that this formula has been used in the past by soda fountain owners who believed in running them for profit, and the service that they have given was satisfactory and they did a good business on this formula. We believe that something of this kind should be worked out and should be bulletined broadcast across the United States so that every jobber of soda fountain supplies can give this information to his customers, thereby cutting down quickly the use of 50 percent of the sugar which has been used for this purpose."

CHANGES OF ADDRESS.

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of the change of address is received before shipment or mailing.

Both the old and the new address should be given thus:

HENRY MILTON,

From 2342 Albion Place, St. Louis, Mo.

To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or typewritten.

CHANGE OF ADDRESSES SINCE DECEMBER 5, 1917.

ROBERTS, J. G.

From 35 Poplar St., Philadelphia, Pa.

To 1634 N. 62nd St., W. Philadelphia, Pa.

ROSENZWEIG, B.

From 495 8th Ave., Brooklyn, N. Y.

To 381 Gold St., Brooklyn, N. Y.

BOADA, F. P.

From Campanrio No. 70 (bajos), Habana, Cuba.

To 27 entre Ay Pasco, Vedado, Habana, Cuba.

FRY, N. G.

From 401 W. North Ave., Chicago, Ill.

To 421 W. North Ave., Chicago, Ill.

GERSHENFELD, LOUIS.

From 1732 S. Ninth St., Philadelphia, Pa.

To 5807 Haverford Ave., Philadelphia, Pa.

TAYLOR, WM.

From 161 W. 140th St., New York, N. Y.

To 515 W. 157th St., New York, N. Y.

BREWER, J. ED.

From 1705 Cherry St., Philadelphia, Pa.

To 1541 Arch St., Norristown, Pa.

NOVACK, H. J.

From 595 Willoughby, Brooklyn, N. Y.

To 3131 W. Norris St., Philadelphia, Pa.

LIEBERSTEIN, LOUIS.

From 223 S. Euclid Ave., St. Louis, Mo.

To 2235 Euclid Ave., St. Louis, Mo.

KURTZ, I. W.

From 316 Clark Ave., St. Louis, Mo.

To 3rd and Cedar Sts., St. Louis, Mo.

NITARDY, F. W.

From 1105 Broadway, Denver, Colo.

To 66 Orange St., Brooklyn, N. Y.

HUNT, REID.

From 240 Longwood Ave., Boston, Mass.

To Harvard Medical School, Boston, Mass.

RHEA, H. M.

From Somerville, Tenn.

To c/o Revenue Agent, Huntington, W. Va.

WAGENER, L. R.

From Bangor, Mich.

To 203 N. Ingalls Ave., Ann Arbor, Mich.

VIEHOEVER, A.

From Washington, D. C.

To Dept. of Chemistry, Urbana, Ill.

CAHAN, S.

From 864 N. 10th St., Philadelphia, Pa.

To S. W. Cor. 8th and Dickinson Sts., Philadelphia, Pa.

To 114 S. West St., Carlisle, Pa.

PUBLICATIONS RECEIVED.

Standard for Pituitary Extract, Apparatus for Studying Effect of Drugs, Slide Holder and Protector for Warming Stage, Deterioration of Cannabis.—*The Lilly Scientific Bulletin*, Series I, No. 8.

A Study of Oil of Chenopodium, By W. H. Zeigler, Professor of Pharmacology, Medical College of the State of South Carolina.

The Preparation and Standardization of Ovarian and Placental Extracts, By. W. H. Morley, M.D.—From the Research Laboratory of Parke, Davis & Co., Detroit, Michigan. Also from same source:

The Frequency and Significance of Dysfunc-

tion of the Internal Secretory System in the Feeble-minded, by Carey Pratt McCord, M.D., Detroit, and H. A. Haynes, M.D., Lapeer, Mich., and *The Pineal Gland*, the Pineal Glands Influence upon Growth and Differentiation, with Particular Reference to Its Influence upon Prenatal Development, by Carey Pratt McCord, M.D., Detroit, Michigan.

Missouri Druggist, Bulletin of the Missouri Pharmaceutical Association, Vol. I, No. 6.

The Pennsylvania Pharmacist, Vol. I, No. 1, to be published quarterly. The issue reflects credit on Editor R. P. Fischelis. A timely

editorial is entitled "Who Gets the Credit." We quote a few lines of this message:

"The day on which pharmacy reaches the degree of 'bigness' which will recognize accomplishment by the body pharmaceutic as paramount to accomplishment by any individual organization in that body, will mark the birthday of a new pharmacy—one which will wield a powerful influence among professional bodies. * * * There never was greater need for the pharmaceutical interests to be 'big' than there is right now. We want a pharmaceutical corps in the army. If we

get it there will be plenty of credit to go around. Our national, state and local associations should realize this and work harmoniously, unitedly and everlastingly until the big object is accomplished."

Sun Dial Address.—At the celebration of New Year's Day, 1918, at Girard College, Philadelphia, the Early Eighties Alumni Association presented their Alma Mater with a Sun dial as their Memorial, when this address of Henry Kraemer, Ph.D., president, was read by Joseph M. McCutcheon, vice-president, on the occasion of the presentation.

JOURNAL ANNOUNCEMENTS.

Subscriptions: Annual subscriptions in advance, including postage: United States and Mexico, \$4.00; Canada, \$4.35; foreign countries, \$4.50. Single copies, 35 cents. Remittances should be made payable to Treasurer H. M. Whelpley, but mailed to JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, Easton, Pa., or 253 Bourse Building, Philadelphia, Pa. Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers.

Requests for Back and Missing Numbers: Requests for back and missing numbers should be typewritten and sent to the Editor. Claims will not be allowed if sufficient notice has not been given of change of address, and in no case if received later than sixty days from date of issue. Notice of change of address should give old and new address.

Contributions: The JOURNAL accepts no responsibility for the opinion of its contributors. Contributions should be type-written and sent to the Editor; use only one side of the sheet for writing, and double-space the lines. Articles are accepted for publication on condition that they are contributed solely to this JOURNAL; and "all papers presented to the Association and its Branches shall become the property of the Association, with the understanding that they are not to be published in any other publications than those of the Association, except by consent of the Committee on Publication." (By-Laws, Chapter X. Article 11.)

Reprints: Authors may obtain reprints of the Eschenbach Printing Company, Easton, Pa., at the prices attached to the proof sent

them, provided the order is received with the returned proof. The prices are also given on this page. Otherwise type is distributed as soon as the JOURNAL is printed.

Advertisements: Communications relating to advertising should be sent to the Editor. Forms close on the first of each month, and copy should be in by the fifteenth of the month preceding date of issue, to receive proof. Date of issue—the fifteenth of the month. Advertising rates sent on request.

Membership: Applications for membership in the American Pharmaceutical Association may be made of any of the officials. The annual payment of five dollars covers the annual dues and subscription to the JOURNAL. Members receive, also, the publications of the Association that are distributed free of charge.

Further information will gladly be furnished by any of the officers of the Association and members.

Cost of Reprints: Reprints will be furnished at the following prices:

SCHEDULE OF RATES FOR REPRINTS, INCLUDING POSTAGE.

| No. copies. | 4 pp. | 8 pp. | 12 pp. | 16 pp. | Covers. |
|-------------|-------|-------|--------|--------|---------|
| 50.... | 1.54 | 3.08 | 4.62 | 6.16 | 1.27 |

Orders may be sent to Eschenbach Printing Company, Easton, Pa., or JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, Easton, Pa., or 253 Bourse Building, Philadelphia, Pa.

SAMUEL CLEMENTS HENRY

CHICAGO, ILL.

Chairman House of Delegates, American Pharmaceutical Association, 1917-1918

SAMUEL C. HENRY

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL. VII

APRIL, 1918

NO. 4

SAMUEL CLEMENTS HENRY.

Samuel C. Henry, chairman of the House of Delegates, American Pharmaceutical Association, is a native of Virginia and, we are informed, a lineal descendant of Patrick Henry. Undoubtedly the subject of this rather incomplete sketch possesses characteristics that were predominant in his antecedant and marked him for lasting fame. While the occasion may not arise which will imprint the memory of Samuel C. Henry on permanent historical records, his activities in organization and legislative matters pertaining to the retail drug business have been eminently successful and helpful, and he will measure up to the greater opportunities which have come to him by his election as Secretary of the National Association of Retail Druggists, of which organization he was president in 1915. His counsel and leadership in shaping national legislation has been and is a valuable asset of that body. He is deliberate in speech, logical in reasoning and measures his statements with assurance of being right.

Mr. Henry was trained as pharmacist in the William S. Thompson pharmacy of Washington, D. C., from where he came to Philadelphia and soon thereafter engaged in the retail drug business on his own account, and later established a second store. He took an active interest in the local retail druggists' association and exhibited high qualities of an efficient organizer, and for a time was president of that association.

His capabilities and comprehension of legislative needs, related to the drug business, were soon recognized, and in such capacity he has labored efficiently for many years in behalf of the local, state and national associations, as member of legislative committees and as chairman.

The approval of his work and his uniform courtesy made him president of the Pennsylvania Pharmaceutical Association, which office he filled with credit to himself and satisfaction to the members. For a number of years he served on the board of trustees of the Philadelphia College of Pharmacy.

In 1909, he joined the American Pharmaceutical Association and, until the time of his leaving Philadelphia, contributed largely to the success of the Local Branch. He did not neglect his affiliation when it became necessary to leave his adopted city, but at once joined enthusiastically with the Chicago members, who welcomed his coming among them. He occupied various official positions in the

Philadelphia Branch and for one year that of presiding officer. The esteem in which he is held was very evident prior to his departure for Chicago and, both the latter body and the Philadelphia Association of Retail Druggists gave public expression thereof in largely attended special meetings in his honor, on which occasions their sincere regard was voiced by speakers at the banquet tables.

Mr. Henry is always found among the workers, and, therefore, aside from his professional duties, he considers that his Church should have his active support and so in this connection he also has been recognized as a faithful member and zealous officer.

Intensely interested in legislative matters, it is not surprising that he should and did take part in political affairs, and was several times honored with the nomination for the Pennsylvania Legislature. Though his campaigns were unsuccessful from one point of view, that of not being elected, his record is clean and his failure in securing the election was largely due to his unwillingness to lend himself to questionable methods and of being the candidate of the minority party in his district.

While Mr. Henry's activities have most largely been concerned with the National Association of Retail Druggists he has not neglected the American Pharmaceutical Association. Last year he served as vice-chairman of the House of Delegates and on several important Association committees; this year, at the Chicago meeting, he will preside over the sessions of the House of Delegates.¹

E. G. E.

CONSERVATION COÖPERATION BETWEEN PHARMACISTS AND PHYSICIANS.

The best reason for the assumption of the possibility and practicability of co-operation for conservation between pharmacists rests upon the fact that the medical profession of our country has outstripped any single body of citizens in its devotion to our country's cause in the present war. Medical practices developed by years of application, lucrative incomes which they yielded, near realization of ambitions for professional advancement fond domestic and social ties, assurance of comfortable futures—all were relinquished promptly and unselfishly by thousands of our medical practitioners when the call came and they placed their abilities and energies unreservedly at the disposal of our Government. To make such acknowledgment of the splendidly patriotic attitude of our medical men, in and out of the service, is directly related to the subject of "conservation of drugs and medicines," and were it pure digression, it would still be entirely pardonable because one would have to be churlish, indeed, to have enjoyed the cordial friendship of many of these manly men and fail to fully and freely commend the fine quality of their citizenship.—*Adapted from a paper by Ambrose Hunsberger on "Practical Drug Conservation," printed in this issue of the JOURNAL.*

¹ Minutes of the House of Delegates, Indianapolis meeting, will be printed in May issue of the JOURNAL.

"THE ESTABLISHMENT OF A PHARMACEUTICAL CORPS"—A TRUMPET CALL TO DUTY!

"And now comes the trumpet call to duty: the fearful, piercing cry of humanity in agony. No longer can we look on and shrug our shoulders and say 'This problem is not ours.' Our own flesh and blood is dedicated to the struggle and will pour out its rich wine of life and youth and of hope."

"Before our eyes millions are giving their all: their last measure of devotion; their last drop of blood. The world lies bleeding before us: a world thus far, that has touched us only as one touches the hem of a garment. But now no longer. Today, at desk, in kitchen and at bedside the call is here and we are facing the mud, the carrion, the terror, the infinite weariness and suffering of the battlefield. Our faces are turned toward those fields of France that are one vast Calvary."—Part of an editorial in the *Ladies Home Journal* for November 1917.

A MERICAN pharmacists desire to enlist in the service for humanity in a capacity wherein they can work most helpfully, but this is impossible under present conditions when there is no pharmaceutical organization in the Army. Without such provision the enlisted pharmacist can not serve efficiently, for his experience counts for little and his knowledge of the science and art of his profession has even less value, and still in civil life pharmacy is regarded as "the right arm of medicine."

The U. S. Government as well as the medical profession accept of the standards for materia medica prepared by pharmacists. In an editorial of a recent issue of the *Pharmaceutical Journal and Pharmacist* (Great Britain) these lines occur: "The United States has been uncommonly fortunate in the possession of a remarkable array of eminent pharmacists who have rendered signal service to the science of pharmacy and to the cause of pharmaceutical education and progress."

Every nation engaged in the War except England and the United States has pharmaceutical corps as part of their Army organization, and England has recently commissioned twenty-one pharmacists—a forward step prompted by the efficient service of the Australasian Pharmaceutical Corps.

That pharmaceutical service is not of a high standard in all of our camps at present is known to pharmacists in the cities near to these camps and therefore the fact need not be further impressed on our readers, most of whom have authentic information thereon from dependable sources. That the service in some of these dispensaries would not be lawful in civil life is also beyond dispute. A sworn statement recites that a dispenser in one of these camps was formerly a bartender, another a cigar salesman and another a bookkeeper. It might be contended that no pharmacist was available and still there are verified statements that there were graduate pharmacists in a camp where inexperienced men dispensed or directed the graduate pharmacist how he should dispense. Such testimony tends to sub-

stantiate the truth of reports relative to dispensing errors of antiseptic tablets of bichloride of mercury for phenacetin and normal salt solution tablets, morphine tablets for calomel tablets, and we have seen tablets of mercuric chloride from one of the important camps that were stocked in tin containers! When the people realize existing conditions they will resent such platitudes as "The needs of the soldiers can be provided for satisfactorily under the present organization." A preceding Surgeon-General openly stated that this work (dispensary) "*was one particular in which the Medical Department is unprepared to fulfill its responsibility to the Army and the nation.*"

We have no desire to render prejudiced judgment; the immensity of the undertaking must be considered together with the fact that there is no provision in our military organization for a pharmaceutical corps. But the health and life of our men deserve as early attention as possible. We all know how promptly the medical men responded to the call of duty and their action commands our highest commendation, but they were overburdened and hence duties had to be assigned to others and in some instances as related. The point is that an organized pharmaceutical service ought to be established, without unnecessary further delay, constituted of men who can take over a great deal of work that must now be done by the medical men and certainly can not be performed by inexperienced hands.

Surgeon-General George J. H. Elyatt, of the British Army has aptly said "that the Medical Department existed for the individual benefit of the soldier, and if they failed in their duty to him they were not faithfully discharging their obligation."

The opinion prevails that Surgeon-General Gorgas does not favor the establishment of a pharmaceutical corps. We know that he is a man of unquestioned sincerity, actuated only by that which, *in his judgment*, he deems best for the Army, an executive of highest ability, fully conscious of the gravity of the situation that confronts us. He has undoubtedly advised with leading physicians and surgeons relative to the necessity of establishing a pharmaceutical corps in the U. S. Army. Whatever their views may be, we are persuaded that the majority of medical men desire the services of an organized efficient pharmaceutical corps.

An axiom of Democracy says: "The whole people is wiser than any group or man in it. Its judgment is safer, surer." The question of the right pharmaceutical service is a broad one, it is not of an individual case or opinion but one to be asked of thousands of physicians, of tens of thousands of parents and sons, "Should the best that is in pharmacy and pharmacists be made available?" "The nation depends upon the proper utilization of every available talent." "It is just as reprehensible to waste talent as material." The people rightfully expect Congress to provide the means and organization and that the Medical Department adopt modern and effective methods for restoring the injured as well as for the conservation of the health and lives of our soldiers. Neither Congress nor the Medical

Department can afford to disappoint them, and we have confidence in their purpose and ability. It is difficult to displace precedent, but the United States can not remain satisfied with our present system when they are made acquainted with the more efficient services rendered by the foreign pharmaceutical corps.

The following question is relevant: "Would the Medical Department of the Army be more or less efficient with an organized corps of trained pharmacists than under the present system?" Other nations have answered the question by an extension of this service, and the Senator from Rhone, Mons. P. Cazenenve testifies to the efficiency of the French Pharmaceutical Corps by saying "That they have contributed eminent service to the country and gained the love and respect of the citizens of France."

Surgeon-General Gorgas recently said, as quoted by the *New York Times* (italics are ours):

"Line officers have had no hesitation in *ignoring* the sanitary recommendations of Medical officers of lower rank. The men of the Medical Corps should get higher rank, *rank commensurate with the importance of the positions they hold.*"

The Surgeon-General should turn his eyes on Pharmacy, a neglected branch of the Army Medical Service to which his remarks apply with equal force.

The Surgeon-General should visualize the possibilities of pharmacy as "the right arm of medicine" and while the services to be rendered are in some respects decidedly different than in civil practice, the relation obtains and there is relative possibility of coöperation. There is absolutely no reason why the breach between the professions should be widened when it is only by close coöperation that both are of the highest service for humanity, and this service is momentous for conserving health and life.

Why rank for pharmacists is necessary for best service to the men in arms need not be discussed at length. The first point is, the life of the Army demands efficient pharmaceutical service for it is an essential of its medical branch; much of the work that burdens this department can be assumed by pharmacists, otherwise the time is not far distant when the supply of medical men will be utterly inadequate for the needs of soldiers and civilians. Rank carries with it authority and respect, without it counsel with physicians and surgeons and other officers is impossible or at least impracticable. Lieut. W. A. Poucher of the British Medical Corps has noted the changed conditions now existing where commissioned pharmaceutical officers have been installed: "Where heretofore there were no consultations with the medical men, there now are to the supreme satisfaction of the latter, and this inspires confidence with the patients which had been absent before." Without rank our pharmacists could not coöperate with those of the foreign armies.

There is another point of importance, qualified pharmacists are men of ability and can secure positions in other departments of the service or qualify as officers.

It is unreasonable to expect that they would not prefer positions of rank or larger pay, hence many have already assumed other duties. This is of serious significance for it has to that extent depleted the ranks of qualified pharmacists, whereas if conditions were different their preference would have been for pharmaceutical service.

Pharmacists have endeavored to impress the importance of a pharmaceutical corps on the Surgeon-General; they are now importuning Congress. The Committee on Military Affairs of the House gave representative pharmacists from nearly every state a respectful hearing on March 19, and the members of the Committee were deeply interested in the presentation. It is not a question of selfish promotion and it is a matter of such evident necessity that some pharmacists are perhaps not as patient as they should be. In the meantime, now, every pharmacist in the country should deem it his duty and privilege to impress the utility of pharmaceutical service on the people so that they will join in the movement, by expressing their honest convictions to their Congressmen and Senators. It is the trumpet call to duty and opportunity of service, for the number of those who are sick and wounded is many, many times larger than those who are killed in action, and the service does not end here for the conservation of health is paramount.

"This problem is ours, our own flesh and blood is dedicated to the struggle." Pharmacy has a mission and pharmacists desire to be of service; they will not have pharmacy discredited, because they know pharmacy in the Army can not be ignored without sacrifice of life and health of our soldiers.

E. G. E.

THE HEARING ON THE EDMONDS BILL.

On March 18, pharmacists from all over the country assembled at the New Southern Hotel, Baltimore, for a discussion of the Edmonds Bill and to plan for submitting arguments before the Committee on Military Affairs of the House, at Washington, Tuesday, March 19, at 10.30 A.M.

The large gathering of representatives in attendance from every section of the country speaks for the deep interest that pharmacists have in the establishment of a Pharmaceutical Corps. The greater number of the state pharmaceutical associations as well as the national organizations connected with the drug trade were represented, and also a majority of the schools of pharmacy holding membership in the American Conference of Pharmaceutical Faculties. There was a free discussion of the Edmonds Bill and also of the arguments in support of a pharmaceutical corps in the U. S. Army. S. L. Hilton, chairman of the A. Ph. A. Committee on the Status of Pharmacists in the Government Service, presided and R. P. Fischelis, secretary of the National Pharmaceutical Service Association was nominated secretary of the meeting.

A committee was appointed to present amendments that would be acceptable for the Edmonds Bill, in case the Committee on Military Affairs would request that changes be made, or if objections were interposed to any of the provisions of this measure. The main change advocated in the draft was to make the ranking officer in the Pharmaceutical Corps a colonel instead of a major, with majors, captains, lieutenants and other officers to correspond to the various branches of the service.

The other modifications related chiefly to phraseology and that various acts provided for in the bill and requiring the approval of the Surgeon-General, should also in addition have the sanction of the Secretary of War.

As speakers at the hearing, Dr. Frederick J. Wulling was named to offer the arguments for the establishment and needs of a pharmaceutical corps in detail. Dr. J. Madison Taylor, of Philadelphia, was selected for voicing the subject from the side of the medical profession. E. G. Eberle was asked to prepare argument showing the need of and the protection afforded by this proposal and also point out some of the unsatisfactory conditions existing at this time in the dispensaries of a number of the camps. Caswell A. Mayo was named to inform the members of the Committee relative to the pharmaceutical corps in foreign armies. To Samuel C. Henry was assigned the duty of an analytical survey of the Edmonds Bill. Prof. Charles E. Caspari was charged with the presentation of the work of pharmacists in compiling standards for the materia medica employed by physicians in their practice. W. L. Crounse was delegated to represent the manufacturers and combat the report that they are not in favor of the establishment of a pharmaceutical corps. The committee for preparing amendments to the Edmonds Bill was named as follows: Joseph W. England, E. C. Brokmeyer, W. L. Crounse, J. A. Koch and R. P. Fischelis.

At Washington the delegates who had met on the previous day in Baltimore were joined by quite a number of others, including a large delegation from New York. Not only was Congressman Edmonds impressed by this large attendance but the Chairman of the Committee on Military Affairs, the Honorable S. Hubert Dent acknowledged the evident coöperative spirit on the part of pharmacists.

The meeting was called to order at the hour set for the hearing and was to have adjourned promptly at twelve o'clock. The interest of the members of the Committee, however, prompted them to freely interrogate the first speaker, Dr. Frederick J. Wulling, so that the larger part of the time assigned for the hearing was taken up by him in presenting his case and in answering questions propounded by members of the Committee.

Dr. Wulling was followed in his remarks by Dr. J. Madison Taylor, who introduced strong and forceful arguments from the physician's standpoint as to why a pharmaceutical corps should be established, stressing the importance of qualified service for this organization.

The time allotted had passed but the Chairman of the Committee as well as the members were so concerned in the subject that they consented that the other speakers briefly state their points, and all of them were permitted at a later day to add to their arguments such statements that it was impossible for them to submit for the want of time.

It was clearly evident that the Committee was impressed and, while there is no certainty as to what their conclusions will be, every one in attendance was highly gratified over the consideration given to the subject and the courtesies which had been extended by the Committee and Congressman Edmonds.

There has been progress, the message should be carried to the people, such help counts for much, and it stands to reason that every citizen who has a son in the service will readily coöperate, if advised relative to the purpose of the Edmonds bill. Do your duty as citizen and pharmacist.

E. G. E.

SCIENTIFIC SECTION

THE MICROANALYSIS OF MALTED MILK.*

BY C. W. BALLARD.

At first thought the application of microanalytical methods to the examination of malted milks seems rather impracticable and the work was undertaken more in the spirit of curiosity than with any real hope of definite results. Chemical methods, even those involving determinations of diastatic power and amino acids content, had failed to yield dependable information excepting as regards fat, protein, ash and moisture. Diastatic figures, even in authentic samples, were widely different. The fat, protein and ash content of a given sample would certainly establish whether whole or skimmed milk had been used in the preparation; but these results do not tell us if the sample is genuine or not. We are dealing with mixtures of varying composition and although limits of variation can be fixed, chemical methods alone will not give us the information we most desire, besides they are complicated and consume much time. A microanalytical determination of a malted milk sample can be fully completed by an experienced worker in less than one hour. Such a report will tell us what kind of milk and malt has been used, and what is more important, whether the sample is a standard processed article or an imitation mixture.

At the time this investigation was started there were no standards for malted milk. Consequently it would have been difficult to prove that several spurious articles sold under this title were misbranded. Prosecution would have involved the question of proper definition of the term "malted milk" and whether the word "malted" was really used in its adjective sense or merely as a trade name. With the issue of Food Inspection Decision 176 (*Service and Regulatory Announcement* 20, July 2, 1917), the proposition becomes less complicated, for malted milk is defined in this decision. Referring to the text of the decision we find the following:

"Malted milk is the product made by combining whole milk with the liquid separated from a mash of ground barley malt and wheat flour, with or without the addition of sodium chloride, sodium bicarbonate and potassium bicarbonate in such a manner as to secure the full enzymic action of the malt extract and by removing water. The resulting product contains not less than seven and one-half percent (7.5%) of butter fat and not more than three and one-half percent (3.5%) of moisture."

It will be apparent from this statement, that the term malted milk, as used at present, is not merely a trade name for the product of a few manufacturers. Products now sold under this title must fulfil certain specifications. I might add that very few of the samples examined would comply with the above requirements. Malted milk is not a *mixture* of various malt products and powdered milk, but is a preparation in which the malt and milk have been changed by process of manufacture so that the resultant differs in chemical constitution as well as microscopical characters, from the substances used in its preparation. The term "processed" will be used here to designate the standard malted milk which fulfils the requirements of the above decision.

* Read before Scientific Section, A. Ph. A., Indianapolis meeting, 1918.

In the preparation of specimens for examination, temporary mounts are best. Glycerin jelly mounts are very poor as even slight heating alters the appearance of the sample. Glycerin, alcohol and water mixture (1 : 1 : 1) is the best medium if specimens are for immediate use. Permanent slides may be prepared by using glycerin, or better still, petroleum oil as a mounting medium. Oil mounts are necessary in every instance as sugars and water-soluble constituents dissolve and are apt to be overlooked. As a preliminary to the microscopical examination, it is absolutely essential that the analyst be thoroughly familiar with the differences in appearance and structure of the various materials used in the manufacture of malted milk. Milk powders and malts vary widely because of different processes of manufacture. The use of dried malt extracts and various fillers add to the difficulty of the work. The materials found by the writer to enter into the manufacture of malted milks, genuine and otherwise, are powdered skimmed milk, powdered whole milk, powdered malt, dried extract of malt, diastase, bread products, glucose, cane sugar, various starches, gelatin and gums. The microscopical characters of each of these substances will first be described.

SKIMMED MILK POWDER.

The process used in the preparation of skimmed milk powder will have great influence upon its color and microscopical appearance. The milk may be evaporated to dryness in steam kettles, vacuum pans or by various devices which force the

milk in spray form over heated rollers. The color of powdered milk prepared in an open steam kettle is golden yellow to dark orange depending upon the degree of heat employed in the operation. It is rather difficult to reduce this milk to fine powder. Vacuum pan and spray dried milks are nearly white and are very finely subdivided. Manufacturers prefer a milk dried by this method as it is more readily soluble than an open dried milk. The individual particles of a skimmed milk powder prepared by vacuum or spray process, are for the most part spherical, although irregular masses are also found. Each particle is probably an aggregation of fat globules held together by solidified albuminous material. Some of the masses may be likened in appearance to enormous polynuclear leucocytes, the fat globules corresponding to nuclei. Many of the forms show a central portion of irregular outline almost filling the mass and containing numerous fat globules. A few of the particles are without apparent fat globules but appear to be filled with a granular substance. Other forms, especially those of irregular outline, are crossed by radiating or branching striations. Worthy of note is the fact that lactose will begin to crystallize in glycerin or water mounts within two hours and will proceed to such an extent as to fill the entire slide. The constancy of this crystallization is such that it becomes an excellent indication of skimmed milk in many preparations.

WHOLE MILK POWDERS.

The methods employed in preparing whole or full milk powders are identical with those discussed under skimmed milk and give rise to the same variations in appearance and color. Open dried full milks are deeper in color and even more impossible of reduction to fine powder. Spray dried full milks are more of a cream color than skimmed milks of similar preparation but are as finely subdivided as the latter. Full milks are not as readily mixed with water as the skimmed product, or as it would be put in the trade, they are not as soluble. This fact has been given as a reason why so many manufacturers of imitation articles use skimmed milk powder instead of whole. Incidentally the skimmed product is cheaper. The particles of a spray or vacuum dried full milk are smaller than those of skimmed milk and more regularly spherical in form. Irregular masses are comparatively scarce. The greater number of the masses do not show the fat globules as distinctly as in skimmed milk. For the most part the masses are of granular appearance and pearly lustre. Several masses may be adherent and give the appearance of budding from a main particle. A few show one or two fat globules embedded in the granular substance. Lactose does not crystallize from water or glycerin mounts of whole milk as readily as it does from skimmed milk. Crystallization may be delayed for a day or even longer.

A few preparations are manufactured from open kettle dried milks. This form of milk powder, skimmed or whole, is difficult of description but fairly easy to recognize. The milk particles are in the form of irregular fragments having fat globules scattered over their surface. In full milks dried by this method, the fat globules are very large and almost cover the surface of the fragments. Open dried skimmed milks have smaller and fewer fat globules and many of the fragments of albuminous material are free from adhering globules.

MALT POWDERS AND PREPARATIONS.

It is common practise with many producers of so-called malted milks to use various malt powders or preparations and merely mix these with certain quantities of powdered milk. A preparation of this sort would be more appropriately named "Malt and Milk" and is entirely different in composition and microscopical appearance from a standard malted milk which complies with the specifications of Food Inspection Decision 170. In examinations of malted milks one will encounter one or more of the following malt products: powdered malt, powdered dried malt extract and diastase. Descriptions with illustrations of these materials in powdered form are here given.

Malt Powder.—Powdered malt exhibits most of the elements of barley although some of these have undergone changes in the malting process. The elements

present, in the order of their relative amounts are: (1) Starch, (2) hairs; (3) outer epidermis of palet; (4) aleurone cells of endosperm; (5) inner epidermis of palet; (6) cross cells of pericarp; (7) parenchyma of endosperm; (8) fibrous tissue; (9) epicarp tissues; (10) tube cells.

The starch is more or less changed by the action of amylolytic ferments during malting. Many of the grains appear to have been eaten away, the central portion or hilum being the first part to undergo digestion; such grains are hollowed out at this point. Other grains show destruction of the outer portions. These partially digested grains when treated with aqueous iodine solution, give the purple to red reaction of amyloextrins and maltodextrins. Depending upon the degree to which the malting process has been carried, we find more or less unchanged starch. Many of the grains showing no physical change fail to give the blue reaction with iodine.

The hairs are of two kinds; short thick-walled and long thin-walled varieties being present in about equal amount. They are usually broken, but the relative thickness of wall to width of the lumen, serves to distinguish one from the other. These hairs were found in every sample of malt and malt product examined.

The outer epidermis of palet is distinguished by the thick-walled wavy cells common to many plants of the Graminaeae family. Between the wavy cells are stoma with guard-cells tightly fitting and almost occluding the actual opening. We also find in this tissue, very short, thick-walled, warty hairs and hair scars.

Aleurone cells of the endosperm are white, thick-walled, angled and closely packed with dark granular nitrogenous material.

Inner epidermis of palet consists of white, thin-walled, long and more or less angled cells. Short thick-walled hairs and nearly square stoma with small but well-defined apertures occur in this tissue.

Cross cells of pericarp are usually adherent to the spermoderm or coat of the endosperm. They are arranged in two layers, one heavy, the other light, consisting in both cases of rectangular, thin-walled cells with or without intercellular spaces. Both layers extend in the same direction and are at right angles to the underlying spermoderm cells.

Parenchyma of endosperm is thin walled, rounded in outline and may or may not contain starch.

Fibrous elements, if occurring singly, may be mistaken for thin-walled hairs, but all fragments of this tissue were in well defined groups, sometimes with remnants of the vascular tissue attached.

The epicarp cells are similar in structure and appearance to those of the inner epidermis of the palet; hairs are present but stoma appear to be lacking.

Tube cells were not apparent in any sample of malt subjected to examination.

Powdered Dried Malt Extract.—This form of malt is probably used more than any other in the manufacture of mixed products sold under the name of malted milk. A great disadvantage is that it is extremely hygroscopic and preparations containing it must be kept very dry or caking will occur. Upon standing in a moist atmosphere for any length of time, secondary fermentations take place and the product assumes a disagreeable odor. It is fairly soluble and when mixed

with skimmed milk powder and used at the soda fountain, produces a beverage without much sediment, of clean white color and even texture. The drink may even have a better appearance than if a standard malted milk had been used.

The elements of note in dry malt extracts are: (1) diastase masses; (2) starch; (3) crystals; (4) tissue fragments; (5) hairs.

The diastase masses are irregular, angled fragments of light yellow color, striated and very soluble. The exact character of this material can only be studied in oil mounts.

Starch is present in small amounts and most of the grains show the effects of diastatic action.

Crystals are very small and for the most part are rectangular in shape with a few of rosette form.

Tissue fragments are mainly loose parenchyma and broken walls of aleurone cells.

Hairs are of types characteristic to malt.

MIXED AND PROCESSED MALTED MILKS.

The Food Inspection Decision definition of malted milk requires that enzymic action shall have taken place and shall have modified the constituents of the mixture. In other words the compound shall have been processed. Malted milks prepared by mechanically mixing certain quantities of powdered milk with malt or malt preparations, no enzymic action having taken place, are conveniently referred to as "mixed malted milks" in distinction to the "processed" products just mentioned. Although patent rights have expired, the details involved in the manufacture of the processed products are not by any means public property and are nearly impossible to obtain from successful producers. Sufficient to say that considerable experience and mechanical equipment is necessary in the work. From the appearance of certain samples, even before the definition was published, I had decided that in the process of manufacture enzyme action had produced certain changes in the materials used. The malt starch was almost entirely digested and not over two or three grains were present in a field. The milk was not in spherical masses containing fat globules embedded in albuminous material although free fat globules were numerous and well distributed. It is certain that in processing, the amylolytic ferments of malt convert the starch to sugars and it may be that the small amounts of proteolytic enzymes in malt have an action upon the albuminous materials of the milk causing their disruption or rendering them soluble in some other manner.

Mixed malted milks are readily identified by the presence of unchanged fat masses, yellowish malt extract particles and the relative scarcity of malt tissues. One must search several fields to locate hairs, starch or other malt elements. Dextrose and soluble particles of malt extract will be visible until dissolved. Oil mounts are necessary for prolonged examinations of these soluble materials. One of the samples submitted for examination was found to be a mixture of powdered malt and milk and displayed all the characteristic elements of both materials. Such combinations are rare and because of the large amount of starch present are not readily soluble or miscible.

The characteristic elements in a standard or processed malted milk, in the order of amounts present, are: (1) free fat globules; (2) milk masses; (3) parenchyma; (4) aleurone cells; (5) palet tissue; (6) malt hairs; (7) diastase masses; (8) starch.

Fat globules are very small, are well distributed throughout the field and are not in aggregates or masses.

Milk masses for the most part are irregular and not spherical in form. Embedded fat globules are present in some of the masses but are almost hidden by the granular substance.

Parenchyma occurs as small, much broken fragments of thin-walled cells.

Aleurone cells withstand the malting process and show very little change from those described under malt.

Palet tissue remains unchanged during processing and is described under malt.

Hairs although much broken are otherwise unchanged.

Diastase masses are similar to those described under dry malt extract. They dissolve rapidly in glycerin or water mounts.

Starch is present in very small amount and the grains show but little change from those of malt.

SUBSTITUTE OR SPURIOUS MALTED MILKS.

Although by far the greater number of spurious malted milks upon the market are merely mixtures of powdered milk, dry malt extract and dextrose, other substances may be present. Chief among

these added materials are various thickeners. The beverage prepared with a standard malted milk is apt to be somewhat thicker in consistency than that prepared with the imitation. To overcome this defect the producers of substitutes often add baked bread products, corn starch and possibly gelatin and gums. Powdered bread crumbs are most used for this purpose as they are cheap and mix rapidly and well with cold water. Starches, gelatin and gums work best in beverages prepared with hot water. Some of the labels attached to these imitation products show much ingenuity in avoiding direct statements that the article is malted milk. The presence of glucose is often accounted for in labelling by the statement that the

FIG. 8

Substitute Malted Milk.

M Milk masses (skimmed); D, Diastase or extract masses; L, Lactose crystals; C, Crystals from malt extract; S, Starch; B, Powdered bread.

material contains a corn product. Bread crumbs have been covered by the general term cereals. In some cases the substitute is sold under various titles framed for no other purpose than evasion of misbranding ordinances.

The following tabulation of microanalyses is sufficient to show the extent to which sophistication is carried in the manufacture and sale of malted milk:

| Sample. | Sold as | How prepared. | Form of malt. | Form of milk. | Source. |
|---------|-------------------------|---------------|---------------|---------------|--------------|
| 1 | Malted milk | Mixed | Extract | Skimmed | Dairy |
| 2 | Malted milk | Mixed | Extract | Skimmed | Manufacturer |

DEPARTMENT OF HEALTH, NEW YORK CITY.

THE STABILITY OF CANNABIS SATIVA AND ITS EXTRACTS.

BY HERBERT C. HAMILTON.

A recent publication by Eckler¹ regarding the deterioration of *Cannabis indica* raises a question which can be answered positively only after a long series of experiments such as Eckler himself conducted.

Over a period of five years, samples of crude drug cannabis were kept under observation, storing it under different conditions. He found that it loses from 1 to 2 percent of its activity monthly, depending apparently on the temperature of the storage room. Five years from now, however, the subject will probably have passed so completely out of general interest that there will be no incentive either to complete the experiments or to make the results public, while at the same time such an apparently authoritative statement going unchallenged may lead to a number of errors. It seems advisable, therefore, to publish some data bearing on this question even if it is not based on systematic experiments. In the course of nearly 20 years' experience in applying the physiological assay process to cannabis preparations, a number of unrelated facts are gradually collected which, taken as a whole, have a value not to be ignored.

Cannabis indica, or to use the botanical term to cover *Cannabis sativa* wherever grown, is scarcely deserving of the attention it has received from time to time in recent years. While a potent drug in many respects, its action is not specific in therapeutics and is not that of a deadly poison.

However, as a potent drug in which no active substance with well-defined chemical characteristics has been recognized, it requires standardization and sufficient investigation to insure that inert extracts be kept off the market.

Attention was first called to the variability of the drug by Houghton,² who found that about 50 percent of the fresh samples of crude drug were devoid of activity.

Later, Houghton and Hamilton³ described a method by which extracts can be standardized and uniformity established in the quality of commercial extracts. It depends on the fact that dogs react to the drug in a degree proportionate to the amount of a standard product administered, and that the reaction is not only characteristic but measurable.

This method, on which all the later modifications have been based, has served as a means of eliminating most of the worthless drug from the market and of discovering evidences of deterioration. Thus it was observed that Powdered Extract Cannabis is apparently an unstable form since several samples have been found inactive. In one case⁴ some step in the process of manufacture caused immediate and almost complete loss of activity.

No other evidence of deterioration has been observed, however, except that which tends to corroborate the data published by Marshall⁵ and quoted by Eckler. The deterioration of the substance to which the name of cannabinol was given while easily demonstrable, does not prove anything about the drug itself or its extracts except when similar phenomena are shown to exist in each. The conclusion which Marshall drew from his observation that "There is good reason to believe that preparations of *Cannabis indica* relatively quickly deteriorate" is not based on any data submitted and is not justified by any data obtained except the two preparations already mentioned. Marshall himself did not apply it to the drug, while Eckler concludes that the crude drug alone is under suspicion, not having observed any deterioration in the fluidextract.

Observations on the crude drug other than samples of indefinite age, are limited to two which will be described below. During a long experience in assaying samples of the crude drug before or immediately after purchase, no low activity has been observed except such as is easily referable to its physical or botanical properties. For example, low activity may be expected from samples consisting of sweepings or from those consisting largely of stems or seeds, or from those having a low yield of alcohol-soluble extractive. (NOTE: By alcohol-soluble extractive is meant the part which will redissolve in 95 percent alcohol after twice evaporating to complete dryness on the steam bath.) Low activity of crude drug other than the exceptions noted would prove nothing in itself because of having no data as to the age of the sample.

Inquiry among holders of crude drug rarely brings to light samples much over 1 year old in stock, and the standard is usually made from drug no fresher than this.

Two samples, however, have recently been obtained from shelf bottles, one 14 years on the shelf and the other at least 21 years and probably longer, 21 years being the limit of the botanist's knowledge. The results of an assay of these two samples in comparison with standard are as follows:

| | |
|-----------------------|------------|
| 14-year old drug..... | 70 percent |
| 21-year old drug..... | 20 percent |

The first was known to the writer to be of good quality, probably fully standard. The second lot was probably also a first-class quality of *Cannabis indica* from its appearance, but there were no recorded tests in existence to prove its activity.

Exact data on old F. E. *Cannabis indica* is limited to one sample other than an occasional retest of samples not over 2 or 3 years old which are almost invariably as active as when fresh. The old sample referred to above was obtained from Hutton and Hilton, retail pharmacists of Washington, D. C. It was prepared by Squibb and had been on the shelf for 17 years. The assay showed a value equal to about 70 percent or between two-thirds and three-fourths as strong as standard. Its original value may be assumed to have been 100 percent.

Exact data on Extract *Cannabis sativa* is limited to one sample, an extract of *Cannabis Americana* first selected for a series of experiments to prove the applicability of the physiological assay to drug intended for clinical use.⁶ This sample has been in constant use in our laboratory for 9 years as a standard for the selection of dogs for assaying cannabis. It is at this time as active as an extract of the best obtainable commercial lots of *Cannabis indica*. It is rare indeed when any extract exceeds it in activity. The sample is kept in a tin can with tightly fitting lid, but is opened on an average not less often than once every week.

The bottles containing the crude drug are 1-pound flint glass, glass-stoppered bottles which have never been sealed and have been kept on shelves exposed to the light and variations of temperature normal to a laboratory work room.

That the above results are not open to the suspicion of being obtained on the basis of a standard of low activity is demonstrated by the fact that comparison was made with a standard which has recently been proposed and prepared by Pearson.⁷ This is in line with a similar suggestion by Lyons⁸ and with that by Hamilton.⁹ It eliminates the variable standard suggested in the Ninth Revision of the U. S. P., and provides identical material for comparison in the several laboratories.

The results summarized above are based on administering doses to dogs and observing the degree of the reaction, comparing the effect in each case with that of a product of known good quality. The dogs' behavior under cannabis must have been previously observed since no two react in exactly the same way. The reaction which is described as "well-marked" or "standard" refers to the incoordination and is not absolute but only relative to that produced by the Standard on that dog.

The doses used and the observed reactions are the bases of the results described in the foregoing article and are given in detail below, the work having been carried out by my colleague, L. W. Rowe:

Sample No. 1 is F. E. *Cannabis indica* from 14-year old drug.

Sample No. 2 is F. E. *Cannabis indica* from 21-year old drug.

Sample No. 3 is F. E. *Cannabis indica* from Hutton and Hilton, Washington, D. C.

Sample No. 4 is S. E. *Cannabis Americana*.

Sample No. 5 is F. E. *Cannabis indica*, mixture of 4 commercial samples supplied by Pearson.

| | Dose per kilo. | Result. |
|---------------|----------------|------------------------------------|
| Sample 1..... | 0.08 mil | Slight incoördination |
| | 0.10 mil | Distinct |
| | 0.12 mil | Well marked |
| | 0.14 mil | Standard |
| Sample 2..... | 0.10 mil | No reaction |
| | 0.20 mil | Very slight |
| | 0.30 mil | Slight |
| | 0.40 mil | Well marked |
| | 0.50 mil | Standard |
| | 0.60 mil | Very marked incoördination |
| Sample 3..... | 0.10 mil | Distinct |
| | 0.12 mil | Well marked |
| | 0.15 mil | Very marked incoördination |
| | 0.12 mil | Well marked, but scarcely standard |
| Sample 4..... | 0.008 mil | Well marked |
| | 0.010 mil | Standard |
| | 0.012 mil | Very marked incoördination |
| Sample 5..... | 0.08 mil | Well marked |
| | 0.10 mil | Standard |
| | 0.12 mil | Very marked incoördination |
| Sample 6..... | 0.025 mil | No reaction |
| | 0.03 mil* | Slight incoördination |
| | 0.04 mil | Distinct incoördination |

* This is the result using the U. S. P. dose and observing the conditions rigidly

The above data leads to the conclusion that the rate of deterioration of *Cannabis sativa* and its official extracts is much slower than would be assumed from Eckler's work and that for practical purposes it may be ignored.

FROM THE RESEARCH LABORATORY OF
PARKE, DAVIS & CO., DETROIT.

THE SOLUBILITY OF PHOSPHATIC KIDNEY STONES.

BY J. F. GEISINGER, M.D., W. F. RUDD AND E. V. GREEVER.

It is unnecessary to explain that any measure contributing to the non-operative removal of urinary calculi is a desideratum of some moment. So common is the condition and so imperative is its demand for attention that a new method of attack need only demonstrate its safety and efficiency to be immediately adopted with enthusiasm.

Operation alone will remove large calculi in the kidney or renal pelvis. About 50 percent of the small stones, however, are according to some statistics, spontaneously expelled if the patent is not hurried into the hands of an over-zealous surgeon. For the remaining 50 percent the cystoscope has done much. We are now cutting the ureteral orifices, dilating the ureters, changing the axis of ureteral stones by catheter manipulations, and injecting around the stones various substances, including lubricants (glycerin) and ureteral relaxants (papaverin). By this means many stones are being teased out or actually picked out with forceps when low enough in the ureter. There always remains, however, a certain number of small stones which will respond to none of these methods and others which will finally yield only after prolonged cystoscopic coaxing, more or less torturing to the patient. It was in consideration of this class that the writers attempted to evolve some additional method short of operation. No consultation of the literature has been made and the method may or may not have been proposed or used before.

It is, of course, well known that certain urinary concretions appear to depend on the acid-alkaline content of the urine. This fact has led to the oral administration of numerous "solvents" which were intended to alter the reaction of the urine and cause dissolution of the calculus. Dismal failure has met this line of treatment. On the same principle that we now irrigate infected renal pelvises with formaldehyde and no longer blindly (and uselessly) give urotropin by mouth and trust to Providence to deposit it in the pelvis in the shape of formaldehyde in sufficient quantity, it occurred to us to make a direct introduction of the solvent. Briefly, it is proposed, in a given case, to introduce through a cystoscope a catheter up to the point of lodgment of a stone in the ureter. Through this catheter the solvent will then be allowed to pass drop by drop on the stone until the mineral contents have been dissolved and the concretion has been reduced to the pulp described hereafter. Two courses are then open: (1) The catheter may be withdrawn and ureteral peristalsis allowed to expel the concretion which can now be easily moulded to any shape. (2) A fish-mouth catheter (now under construction) may be passed up to the concretion and the soft pulp aspirated into the mouth of the catheter by means of a suction apparatus, such as a hypodermic syringe. Details of the technique are clear in the mind of the writer but need not be entered into here.

It is, of course, important to be certain in advance that the acid will do no damage to the kidney. We had planned extensive animal experimentation in

connection with this point and several other points associated with the problem. We had also proposed an attempt to extend the applicability of the method to stones other than phosphatic. Unfortunately, circumstances have interrupted this programme and the prospect of an early transference of Dr. Geisinger to France or some other portion of the war zone, makes it unlikely that the subject can be further studied for many months. Hence, it may be that we are premature in introducing the discussion; our results thus far, however, have been of such a character as to lead us on with great enthusiasm, and perhaps this publication will at least induce others to carry the work out to definite conclusions on one side or the other.

The following tables indicate results of experimental work on the stones *in vitro*,

The solution to be used was placed in the one-gallon bottle and the flow regulated by means of the screw clamp so that from 12 to 27 drops would drop on the stone per minute. This was allowed to run until the stone became soft.

An interesting feature about this was that the stones contained some organic matter which, while saturated with the solution, remained as large as the original stone and of the same color but of such a consistency that they could hardly be handled without breaking, and could easily be moulded into any shape. On drying, this residue would contract to about one-tenth of its original size and become dark brown to black in color.

At frequent intervals (except in Stones C and D, Experiment 1), the stone was taken out and examined to determine whether or not the inorganic constituents had been dissolved.

After the stone had become soft, which showed the inorganic constituents had been removed, the residue was dried and weighed.

TABLE 1.

An analysis of these stones indicated the presence of the following radicals:
Calcium, traces of magnesium, phosphate and traces of carbonate.

| Stone. | Weight. | Solution used. | No. of drops per minute. | No. Cc. used. | No. Cc. used per mg. | Weight of residue. |
|--------|---------|----------------------|--------------------------|---------------|----------------------|--------------------|
| A | 0.1778 | 2% aluminium acetate | 25 | 500 | 2.81 | 0.1694 |
| B | 0.3352 | 5% ammonium chloride | 27 | 2000 | 5.98 | 0.3302 |
| C | 0.1316 | 1% hydrochloric acid | 19 | 2500 | 19 | 0.011 |
| D | 0.1694 | 1% hydrochloric acid | 20 | 720 | 4.25 | 0.0132 |
| E | 0.1818 | 1% hydrochloric acid | 15 | 80 | 0.44 | 0.0118 |

The large amount of solution used in C and D was due to the fact that we could see no change in size or color of the stone and, therefore, could not tell when all the mineral constituents were dissolved.

Stone E was observed very carefully to determine the minimum amount that was necessary.

TABLE 2.

An analysis of these stones indicated the presence of the following radicals:
Calcium, magnesium, phosphate and traces of carbonate.

| Stone. | Weight | Solution used. | No. of drops per minute. | No. Cc. used. | No. Cc. used per mg. | Wt. of residue. |
|--------|--------|-------------------------|---------------------------------------------------------------------------|---------------|----------------------|-----------------|
| A | 0.0727 | 0.26 hydrochloric acid | 15 | 390 | 5.38 | 0.006 |
| B | 0.1202 | 0.13 hydrochloric acid | 5 to 7 Cc. were allowed to run on the stone and remain for 1 to 2 minutes | 860 | 7.15 | 0.007 |
| C | 0.1414 | 0.13% hydrochloric acid | 18 | 500 | 3.56 | 0.006 |
| D | 0.2864 | 0.13% hydrochloric acid | 20 | 2090 | 7.37 | ... |

In an attempt to duplicate the natural condition in the body, stone D was placed in the large tube. An equal number of drops of the hydrochloric acid solution and urine obtained from the patient, were then allowed to flow through a tube and drop on the stone. This made approximately a 0.06 percent solution of hydrochloric acid acting on the stone till it was dissolved, which took about 48 hours.

From the experiments which we have reported, we feel justified in making the following statements:

First, that a 0.06 percent solution of hydrochloric acid will dissolve phosphatic stones.

Second, that the length of time the solution is in contact with the stone is a more important factor than the rate of flow.

In a limited way we have already demonstrated that acid eight times the strength of that to be employed clinically has no deleterious effect in the pelvis of a dog's kidney. Furthermore, we have used the acid in 0.5 percent solution in one patient with phosphatic diathesis and not only did no harm but accomplished excellent temporary results. Finally, in the treatment of renal infections, we have in scores of cases irrigated the pelvis with silver nitrate varying in strength from 1 : 1000 to 5 percent and with formaldehyde solution varying in strength from 1 : 5000 to 1 : 1000. This is an accepted and highly effective treatment for this condition. Certainly the mild hydrochloric acid solution—less than ($\frac{1}{8}$ of 1 percent) will prove no more irritating than these pungent solutions. If it be objected that the process required a continuous hydrochloric acid drip lasting perhaps through several hours, we will reply (with a citation of cases if necessary) that we have conducted a continuous formaldehyde irrigation of the renal pelvis lasting from 3 to 24 hours and the patients have not only survived the treatment but recovered as a result of it.

Summed up in a word, we are satisfied that in expert hands the method will prove harmless, and if time permits we propose to put it to immediate clinical use. Only the results of its application in a series of actual cases will determine unequivocally whether it deserves the consideration it now appears to demand or whether it will eventually find its way to the therapeutic scrap-pile.

MEDICAL COLLEGE OF VIRGINIA,
RICHMOND, VA.

A NEW METHOD OF EXTRACTING DRUGS FOR ALKALOIDAL ASSAYING.*

BY WM. MASKE, JR.

In brief, the U. S. P. method for extraction of most drugs for alkaloidal assaying consists of macerating a weighed portion of the drug in an alkaline solution of ether, chloroform, or a mixture of the two for a certain length of time; then pouring off an aliquot part of this extractive.

There are some things in this method of extraction which all chemists will admit are undesirable, if a satisfactory method of improving them can be obtained.

* Read before Scientific Section, A. Ph. A., Indianapolis meeting, 1917.

In the first place, we have no means whereby we can easily test whether or not the crude drug has been completely extracted of its alkaloidal constituents; and, in the second place, the use of aliquot parts has always been considered a makeshift, and it is particularly so in alkaloidal assaying, since the moisture content of the drug and the addition of ammonia water produce changes in the volume of the extracting solvent which cannot but help to make the assay somewhat inaccurate.

The following method devised by the writer overcomes both of these errors; it is simple, and will be a useful remedy to the aliquot part method. There are only two things standing in the way of it; first, the method takes a longer time. Although the actual time that it takes is longer, yet it requires no more work on the part of the operator than the U. S. P. process. Secondly, the liquid with its extractive from the crude drug must be a very limpid one; hence the liquid used for extracting the drug must be ether, chloroform, or one of similar limpidity; and the drug itself must contain no fatty matter, or anything else that will impair the limpidity of the menstruum.

This new method of extraction is carried out as follows:

Into the stop-cock orifice of a separatory funnel there is inserted a wedge-shaped piece of purified cotton, to act as a filter but at the same time not be too slow in acting as such; a little experience will enable one to know just how tightly to have it fit. Both ends of the piece of cotton are cut off flush with the surface of the stop-cock, and the ends are slightly pushed in with a blunt instrument. The stop-cock is then wiped off with a clean towel so as to remove all cotton fibers, and finally reinserted into the separatory funnel. In selecting a separatory funnel for this process be sure to get one in which the stop-cock orifice has a fairly wide bore. No cotton fiber must be left on the plugged stop-cock or the apparatus will leak.

The drug to be assayed is weighed out. Less drug is needed than by the U. S. P. method. The amount of drug taken is not the amount used in the U. S. P. but the amount of drug that the aliquot part used for shaking out represents. Place this drug into the prepared separatory funnel and add half the amount of solvent directed in the U. S. P. method. The amount of solvent need not be accurately measured; it need only be approximate. Stopper and shake thoroughly; then add the amount of ammonia directed by the U. S. P. Shake every five minutes for one hour. Then pour about 10 Cc. of solvent around the rim of the funnel so as to wash any drug adhering to the sides into the menstruum. Stopper and let stand over night.

Then open the stop-cock and stopper and allow the extractive to filter off into another separatory funnel. When most of the filtrate has run off and it begins to drop slowly carefully add about 10 Cc. of the extracting liquid and let this filter off. This process of displacement is continued in 10 Cc. portions until a few drops of the filtrate evaporated to dryness and dissolved in 1 Cc. of $N/10$ HCl does not give more than faint opalescence with an appropriate alkaloidal precipitant. The combined filtrates are then made acid and the assay continued as given in the U. S. P.

In addition to overcoming errors, this method uses less drug, and usually less solvent than the U. S. P. method of extraction. In order to show that this method gives higher and better checking results than the U. S. P. process in practice as well as in theory, the following results are appended here. In eight assays of belladonna root, four carried out by each method of extraction, the results were as follows:

By the U. S. P. method of extraction the percents of alkaloids ran as follows: 1.59 percent, 1.69 percent, 1.56 percent, 1.64 percent. By the new method of extraction 1.66 percent, 1.71 percent, 1.66 percent, 1.65 percent. In eight cinchona assays carried on in the same way the results ran as follows: By the

U. S. P. extraction method, the percentage of alkaloids was 6.31 percent, 6.28 percent, 6.41 percent, 6.24 percent. By the new extraction method, 6.37 percent, 6.39 percent, 6.34 percent, 6.40 percent. In another assay of cinchona, the writer took two samples, each five grammes, from the same batch of cinchona and got the same weight of alkaloid from each down to the fourth decimal place. This is the only perfect check that he has ever obtained in the hundreds of alkaloidal assays that he has run.

This method of extraction is applicable to all U. S. P. alkaloidal assays of crude drugs except *colchicum* seed, *colchicum* corm, opium and *physostigma*.

UNIVERSITY OF WASHINGTON,
COLLEGE OF PHARMACY.

SOME POSSIBLE PHARMACEUTICAL USES OF PARA-DICHLORBENZENE.

A PLEA FOR THE USE AND FURTHER INVESTIGATION OF A BY-PRODUCT RESULTING FROM THE WAR.

BY W. A. KONANTZ.¹

In the chlorination of benzene at ordinary temperatures, about 85-90 percent of monochlorobenzene and 10-15 percent of dichlorobenzene, chiefly para, are produced. At the present time enormous quantities of benzene are being chlorinated, for it has been found that picric acid can be made more cheaply from monochlorobenzene than from phenol. At the same time, however, large quantities of dichlorobenzene are accumulating, for which there is very little demand. For the complete success of this most valuable process of manufacturing picric acid, it is necessary that uses be found for the dichlorobenzene. Owing to the firmness with which the chlorine atoms are attached to the benzene nucleus, *p*-dichlorobenzene does not enter readily into chemical reactions, and all attempts to convert it into other commercially valuable compounds have so far been unsuccessful. The physical properties of this substance are such, however, that the writer believes it may prove of considerable value in pharmacy. Some possible pharmaceutical uses which have occurred to the writer are here described, in the hope that pharmacists and manufacturers will try them out and so help to solve the problem of utilizing this by-product.

From the viewpoint of the pharmacist, the most valuable property of *p*-dichlorobenzene, and the one upon which most of its pharmaceutical uses will undoubtedly be based, is its powerful destructive action on certain lower forms of life. Galewsky, who studied the relative efficiency of many substances as moth exterminators,

¹ Research Chemist, College of Pharmacy, University of Iowa.

reported (*Z. Textil. Ind.*, 1915, 506) that *p*-dichlorobenzene is the most effective agent for this purpose, being superior to naphthalene, which is generally used. Many tons of *p*-dichlorobenzene could, undoubtedly, be disposed of annually in the form of moth-balls, moth-powders, moth-solutions, moth-paper, etc., if it were properly pushed. In physical properties *p*-dichlorobenzene resembles naphthalene very closely. It occurs as transparent, colorless flakes, somewhat unctuous to the touch, and of a faint, rather agreeable, camphor-like odor. It melts at 53°C . and boils at 172°C ., the corresponding constants for naphthalene being 79°C . and 218°C .; it is, therefore, more volatile than the latter. Besides its greater efficiency as a moth exterminator, *p*-dichlorobenzene has the added advantage over naphthalene that the odor can be more readily removed from garments with which it has been packed. Strips of cloth saturated with a concentrated solution of *p*-dichlorobenzene in gasoline and dried, lost the odor completely after several hours of airing in the sun. The writer further finds that *p*-dichlorobenzene can be easily compressed into tablets with an ordinary tablet machine, and that it can also be readily formed into balls by melting and pouring it into molds. On the whole, *p*-dichlorobenzene seems excellently adapted for use as a moth-repellant, and, as it can probably be bought for less than naphthalene, it deserves to supplant the latter for this purpose. The writer earnestly recommends that pharmacists and manufacturers introduce and push it as a moth exterminator.

The effect of *p*-dichlorobenzene on moths suggests that it may also be of value in exterminating or repelling other pests. Dissolved in benzine or any other suitable solvent and applied as a spray to the joints of woodwork, to clothing which has been attacked, and to other articles, it may prove effective against various insects, bedbugs, roaches, ants, flies, etc., and their eggs or larvae. On account of the inflammability of benzine, it may well be replaced by carbon tetrachloride as a solvent, since the dichlorobenzene is very soluble in this liquid, and also in alcohol, ether, chloroform and benzene. Solutions of *p*-dichlorobenzene may also prove useful against vermin on animals and birds, and as a spray for plants.

It is also possible that the insecticidal and antiseptic properties of *p*-dichlorobenzene may render it applicable in the treatment of certain skin diseases. The writer finds that it is very soluble in petrolatum, lard and many fixed and volatile oils, and large quantities of it can be easily incorporated by simply stirring it into the melted base.

Many other uses for *p*-dichlorobenzene, than those which have here been briefly mentioned, may suggest themselves to those who will give the subject a little thought and carry out a few experiments. The attention of pharmacists and manufacturers has been called to this problem because it is nationally and commercially important that it be solved as soon as possible. It is hoped that those who work on the problem will publish their results, even though they may be negative, in order that the greatest possible good may come of their efforts. The writer will be glad to give such assistance as he can to any one who is interested.

THE CHEMISTRY OF THE HEPTANE SOLUTION.*

BY EDWARD KREMERS.

This investigation has grown out of the phytochemical studies of two California pines, *viz.*, *Pinus sabiniana* and *Pinus Jeffreyi*; and, subsequently, out of the desire to introduce heptane as a solvent for a variety of purposes. One of the uses to which heptane was put was that of a vaporizer of water in moisture determinations according to one of the modifications of the so-called xylene method. In this application it soon became apparent that heptane, like xylene, might serve an additional purpose. Since it is a highly selective solvent, the use of an excess of heptane enables the investigator to test for a variety of substances in a preliminary manner. In order to know what substances might be tested for, it became necessary to acquire a better knowledge of the solubility of a large variety of substances, not only of those found in plants, but of chemicals in general. In order to supplement the range of substances more readily soluble in hot than in cold heptane, *viz.*, those that might be expected to crystallize out upon cooling after the completion of the moisture determination by a knowledge of those that might be expected to remain in solution, an extension of the work originally contemplated had to be undertaken.

While it is quite feasible, in part, to test this heptane solution with the ordinary reagents in aqueous solution, the desirability to test the heptane solution with reagents also in heptane solution soon presented itself. This lead almost immediately to striking results. As a matter of fact, the results soon became so numerous that they threatened to confuse. Hence, a systematic survey was undertaken, which yielded new data at every turn. A mere attempt to enumerate them would require hours.

The peculiar chemistry thus opened up has been designated a "new chemistry." While it is well known that chemists have long experimented with petroleum ether and other mixtures of unknown composition, the heptane used (not the commercial mixture that sails falsely under this flag) is a definite chemical substance capable of an unusual degree of purification. Moreover, it is worth while to work quantitatively with such solutions, hence the determination of the physical and chemical constants of the solutions adds materially to the significance of the study of the chemistry of the heptane solution.

* An abstract of the subject submitted by the author at the Indianapolis meeting, A. Ph. A., 1917.

PRACTICAL PHARMACY SECTION

ELIXIRS OF THE NATIONAL FORMULARY.*

BY HORATIO C. WOOD, JR., M.D.[†]

Despite the fact that the National Formulary is a legal standard, in many states on a parity with the United States Pharmacopoeia, it has failed to come into general use by the medical profession. This is unfortunate, because there are in it many excellent formulas which should be valuable additions to the physician's armamentarium. It seems to me, therefore, to be well worth while to inquire into the reasons for this lack of confidence in the book, with the idea that in future editions these faults may be corrected so that it shall receive more popular acceptance. This distrust has been engendered in large part by the fact that the book contains so much that is unworthy of an official standard, that physicians in general have a sort of fear of its reliability. While there are a few things in the Pharmacopoeia which might better be omitted, as a whole that work is so excellent that the medical profession in general have an idea that anything in the Pharmacopoeia must be all right. Certainly they have no such feeling as concerns the National Formulary. This is a great pity, because a widely accepted book of the character of the National Formulary would not only be of large use to the medical profession in illustrating elegant modes of prescribing but would, I believe, serve a useful purpose in lessening the employment of nostrums. Therefore, although the criticisms I am about to offer may seem like disparagement they are really constructive and offered with the hope that in the future the National Formulary may be purged of some of these glaring faults. In order to show how a little blue penciling would have improved the present edition of the National Formulary, I have chosen the elixirs as one of the important vulnerable subjects.

As a whole, doctors do not possess a very extensive knowledge of the subject of properly flavoring their prescriptions. Most of them, however, do know that there is an official aromatic elixir and that it has a rather agreeable taste, and many physicians are prone to employ it almost routinely as a vehicle. They do so, not because of the universal suitability of this elixir, but because of their ignorance of other methods of disguising unpleasant tastes. One would have thought, however, that a committee of such eminent pharmacists as those who have charge of the preparation of the National Formulary would have been able to devise an acceptable substitute which might afford an occasional variant. Out of seventy-six elixirs recognized by the National Formulary, fifty-two contain aromatic elixir, and two others, compound spirit of orange. Nor is the aromatic elixir by any means always the most successful flavor which might have been chosen. I remember well a very interesting paper by Mr. Beringer on the value of vanilla to disguise the taste of bromides, and I presume it was this contribution of Mr. Beringer's which led to the recognition of the compound elixir of vanillin. It seems a strange whimsy of fate, therefore, that not a single one of the elixirs of the bromides contains any vanilla. We have the elixir of ammonium, calcium, lithium, sodium, and potassium bromide, all of them flavored with syrup and aromatic elixir.

* Read before Philadelphia Branch A. Ph. A., March meeting, 1918.

[†] Professor of Pharmacology and Therapeutics in the University of Pennsylvania.

While on the subject of the bromides, attention might be called to the absurd and inconsistent proportions which these elixirs contain. The elixirs of ammonium, calcium, and lithium contain $8\frac{1}{2}$ percent of active ingredient. The official dose for the first two of these is given as one fluidrachm, so that the patient would receive five grains of the bromide at a dose, which is a quantity too small to have any appreciable influence. The elixir of lithium bromide contains the same quantity of active ingredient—in fact, when we allow for its lesser atomic weight it contains actually a larger amount of bromide—and yet the dose is given as two fluidrachms. Still more ridiculous in inconsistency is the elixir of sodium bromide, which contains $17\frac{1}{2}$ percent as opposed to $8\frac{1}{2}$ percent in ammonium bromide and yet is given in twice as large dose.

While on the subject of dosage and to show the total unsuitability of aromatic elixir for some purposes, may I call attention to the elixir of potassium acetate? This contains approximately five grains of potassium acetate in a fluidrachm of aromatic elixir and the average dose is given as four fluidrachms, which represents a reasonable but not excessive amount of the active salt. This amount of potassium acetate is often repeated every two hours, which means that a patient would take in the course of one day an amount of alcohol equivalent to four ounces of whisky. In view of the call being made for conservation of alcohol, this certainly seems a wicked waste of ardent spirits, the more so because potassium acetate is often used in conditions in which alcohol is absolutely harmful.

The editors of the National Formulary prepared two elixirs which were practically free from alcohol and then proceeded not to use them. Lithium salicylate is used practically only in the treatment of gout, in which all physicians are agreed that alcohol is injurious, and yet to get an efficient dose of lithium salicylate in the form of the elixir, the unfortunate patient must ingest the equivalent of nearly half an ounce of whisky with every dose.

A COMPARISON OF THE DOSES OF N. F. ELIXIRS WITH THE U. S. P. AVERAGE DOSES OF THEIR CONSTITUENTS.

| | Amount in average dose of N. F. elixir. | U. S. P. average dose. |
|-----------------------------------|-----------------------------------------------|---------------------------|
| Elixir Ammonii Bromidi..... | 5.1 grains | 15 grains |
| Elixir Ammonii Valeratis..... | 2.1 grains | 8 grains |
| Elixir Buchu..... | 7.5 grains | 30 grains |
| Elixir Calcii Bromidi..... | 5.1 grains | 15 grains |
| Elixir Calcii Hypophosphitis..... | 4.2 grains | 8 grains |
| Elixir Cascarae Sagradae..... | 30.0 grains | 15 grains |
| Elixir Ferri Phosphatis..... | 2.1 grains | 4 grains |
| Elixir Gentianae..... | 2.1 grains | 15 grains |
| Elixir Guaranæ..... | 12.0 grains | 30 grains |
| Elixir Lithii Bromidi..... | 10.2 grains | 15 grains |
| Elixir Lithii Citratis..... | 10.2 grains | 8 grains |
| Elixir Pepsini..... | 1.0 gram | 8 grains |
| Elixir Phosphori..... | $\frac{1}{120}$ grain | $\frac{1}{120}$ grain |
| Elixir Potassii Acetatis..... | 20.4 grains | 15 grains |
| Elixir Potassii Bromidi..... | 21.0 grains | 15 grains |
| Elixir Sodii Bromidi..... | 21.0 grains | 15 grains |
| Elixir Sodii Hypophosphitis..... | 2.1 grains | 15 grains |
| Elixir Sodii Salicylatis..... | 5.1 grains | 15 grains |
| Elixir Terpinæ Hydratis..... | 1.0 grains | 4 grains |
| Elixir Viburni Prunifolii..... | 7.5 grains | 30 grains |

I have thought it might be interesting to compare the quantity of the active ingredients in the officially recommended dose of some of these elixirs with the average dose as given by the United States Pharmacopoeia. I have, therefore, prepared a table showing these comparative doses.

I should like to direct notice especially to the elixir of buchu, containing one-fourth the U. S. P. dose; to the elixir of pepsin, with one-eighth the U. S. P. dose; and, on the other hand, to the elixir of phosphorus with double the pharmacopoeial quantity. The latter is especially objectionable not only because one-sixtieth of a grain of phosphorus is a dangerously large quantity but also on account of the difficulty of reducing the dose.

In looking over the group of elixirs as a whole, one gets the impression that less thought has been expended on many of them than many a doctor would give to a single prescription. For instance, such a thing as the elixir of cascara sagrada, made by simply mixing together equal parts of aromatic fluidextract of cascara sagrada and aromatic elixir seems to me to be an insult to the medical profession as suggesting that they have not intelligence enough to dilute the aromatic fluidextract of cascara sagrada, as well as being far from a triumph of pharmaceutical skill. All such simple combinations as elixir of lithium citrate, of potassium acetate, of the various bromides, of ferric phosphate, etc., might much better be left to extemporaneous prescribing where the doctor could adjust the dose to suit the case at hand.

When we come to study the complex elixirs, those which contain several active ingredients, we begin to tread that dangerous ground of therapeutic efficiency, about which there is much difference of opinion. I am not going to say anything about the advisability, let alone the justifiability, of the use of elixir of hypophosphites, of gentian, of corydalis, or of the formates, except to express my personal opinion that they serve no useful purpose, but I must confess that I stand in amazement at the perfervid imagination which could conceive of a pathological condition where such a conglomeration as the elixir of pepsin, bismuth and strychnine could be indicated. This wonderful concoction contains a trace of the digestive enzyme which is killed by alcohol and murdered by a heavy metal, plus a small quantity of a feeble astringent and an infinitesimal amount of a nerve stimulant.

While talking about pepsin, may I inquire what is the idea of the elixir of pepsin and iron, or of the elixir of cinchona, pepsin and iron? The only possible excuse for the elixir of cinchona alkaloids, iron, bismuth and strychnine is the old idea of "the more the messier." Know ye not, brethren, that pepsin is chemically incompatible with the heavy metals and that alcohol destroys its enzymic activity?

Having called attention to a few of the more glaring faults of these elixirs, I am hearing you wonder whether I have nothing in the way of favorable criticism. Yes, I believe that the elixir of bitter almonds, of anise, of vanillin, of eriodictyon and of gentian deserve recognition as flavoring agents. The elixir of phosphorus may also be of service as affording a pleasant means of exhibiting a drug rather difficult to manage. Perhaps the elixir of iron, quinine and strychnine, of terpin hydrate and of compound glycerophosphates might be continued as concession to those who believe that they possess utility and as being rather difficult for the physician to prescribe extemporaneously. The elixir of sodium bromide, of three bromides, of iron phosphate, of sodium salicylate, and compound elixir of black-

berry, and possibly one or two others might, after some modification, be afforded recognition, but certainly both medicine and pharmacy would be vastly improved by deleting at least sixty of these elixirs as being either unnecessary, useless, or absolutely injurious.

ABSTRACT OF DISCUSSION.

CHARLES H. LAWALL: Dr. Wood's paper contains some very interesting and valuable food for thought and some interesting points are brought out. It must not be forgotten that a large number of preparations are in our U. S. P. and N. F. because the physicians prescribe them and there is a consequent necessity for their standardization.

I remember hearing that a very eminent member of the U. S. P. Revision Committee once said that the basis for admission to the U. S. P. should be the amount of use of a product by physicians and that if there were a sufficiently large number of physicians prescribing brick dust, that article should have standards set for it in the U. S. P. It may be interesting to Dr. Wood, too, to know that the eminent authority credited with the statement was Dr. Horatio C. Wood, Sr.

GEORGE M. BERINGER: There is much in this paper that we can approve and I am thoroughly in accord with many of the statements of Dr. Wood. In my experience in the revisions of the U. S. P. and N. F., I have learned that all revision work is largely made up of compromises and in the Committee on N. F. some of the points here presented were discussed, and while my personal views, for example, as to the proper flavorings for bromide elixirs, were presented, the majority of the Committee were averse to making any change in the flavoring.

Human work is always characterized by some inconsistencies and these inconsistencies and errors as much as the progress of medical sciences necessitate revisions of the standard authorities. When the Federal Food and Drugs Act of 1906 was enacted and specified the tests laid down in the National Formulary as the legal authority for N. F. drugs, we were confronted by a rather anomalous situation as the N. F. laid down no tests, as the N. F. III had been prepared without the thought that it was to be made a legal authority. This necessitated a far more thorough revision of the N. F. than had been previously attempted and it must be admitted that the Fourth Edition is entirely different in character and scientific standing from its predecessors, and further, that it will compare favorably with similar formularies of foreign countries and that it well serves its position as a companion authority with the U. S. P. I fear that we have overlooked that all of such works are the results of evolution and the U. S. P. is now the Ninth Revision while the N. F. is but the Fourth Edition. As such it should be compared with some of the earlier revisions of the U. S. P.

In the National Formulary the pharmacist must, as in other matters, follow the physician and the practice of the medical profession in the United States is responsible for the existence of many of the formulas criticised as therapeutically inactive. While this may be so, the committee on N. F. found that these were so extensively used throughout the country that an official formula was necessary. In a prefatory note the Committee distinctly stated that they were not responsible for the therapeutic value of the formulas presented. Their duty was plainly the making of standards and formulas that were satisfactory from the pharmaceutical standpoint. How well they have discharged this duty is of course open to criticism, but the inclusion of formulas, even though they may be, from the viewpoint of the therapeutic experts, errors are faults of the prescribers of such. Possibly no preparation is more frequently prescribed than is the compound elixir of pepsin or as the N. F. III named it Compound Digestive Elixir. Listening to the demands of the class of the medical profession, the Committee eliminated this formula from the revision with the result that we have now no legal authority or standard for a preparation that is prescribed to the extent of many thousands of gallons and by a number of physician outnumbering many times those who were so strongly objecting to the retention even of the improved formula which had been proposed and which had actually been adopted. My personal strenuous objection did not prevent the Committee reversing itself. But what is the result? Throughout the country, a preparation used to an enormous extent, is being dispensed without any uniformity of color, taste, odor, alcoholic content or enzymic content. The N. F. has failed to discharge, in this respect, the very duty that called it into existence, and, more seriously, a

legal standard has been destroyed and substandard goods to an enormous extent have since flooded the country. Who is responsible for these errors? Are they not really caused by the failure of physicians to agree?

Regarding the formulas for the elixirs, I quite agree that these are entirely too numerous and that medical practice should be so planned as to eliminate a number, but the physicians here again must decide which they will discontinue to use. The formula for Elixir of Cascara Sagrada has been referred to; this well illustrates a principle which held in the N. F., namely to frame formulas wherever possible to permit of extemporaneous preparation. The formula adopted is simply a mixture of fluidextract and elixir. This simplified manipulation can surely not be considered objectionable and the formula appears to have proven satisfactory and has well served its purpose of supplying a standard formula that will insure uniformity in compounding of prescriptions for this article.

Regarding the basic elixirs of the N. F., the committee had in mind two facts, namely the necessity for many medicaments of reducing the alcoholic content of the diluent or vehicle and that, at times, patients became tired of one flavoring and although a combination like the compound spirit of orange was generally liked at times a change was desirable. For these reasons they proposed several new elixirs which widened the list of vehicular flavors so that the physician could select the most appropriate and varying in alcoholic strength from 5 percent or 10 percent up to 30 percent in the curacao elixir. The value of the weaker alcoholic elixirs like the Compound Elixir of Almond, the Compound Elixir of Cardamom and the Compound Elixir of Vanillin is beginning to be appreciated by the physicians and will in time become more popular.

The question of dosage has been raised and the posology of the N. F. has been criticized. With equal force these comments could have been made applicable to the U. S. P. Following the example of the U. S. P., the N. F. has adopted the plan of stating the average doses. Even the word used "*average dose*" was capable of several constructions. Moreover, physicians, whose special function it has been to determine the official statements regarding dosages, could not agree and many inconsistencies exist in the statements of these in both the U. S. P. and N. F. As a matter of fact, the doses stated in the National Formulary have been supplied by a physician who has rendered this valuable assistance on a purely medical matter to the N. F. Committee.

J. W. ENGLAND. I believe with Dr. Wood that some of the formulas in the National Formulary are therapeutically illy balanced, but their number is small. The book, as a whole, is the result of years of clinical experience by thousands of successful physicians. Like Topsy, many of the formulas "just grew up." They were originally physicians' prescriptions, gradually acquired a local reputation, and then a national one demanding a standard formula. Originating in various sections of the country, formulas of similar compounds were made of a different content of active ingredient in each dose, but such formulas can be readily standardized in the future, now that the National Formulary is a legal authority with standards that can be enforced.

The extent of the use of a drug or drug preparation is, rightly, the acid test as to whether or not it should be officially recognized. A nationally or widely used drug or drug preparation should have a national standard.

The clinician is the man who should say what drugs and drug preparations should be used in medical practice, and he says this through his prescriptions. No stream can rise higher than its source, and the National Formulary should and does most efficiently represent the wishes of the rank and file of the medical profession in this country.

FRANKLIN M. APPLE: At the meeting of the A. Ph. A., held in Detroit, Mich., in 1914, Mr. Beringer in his address as President of the Association, recommended that an epitome of the N. F. IV be prepared, also that a Committee on Propaganda be created to give a great measure of publicity to the new edition of the N. F., especially so to the members of the medical profession.

It is essential to do so as the medical practitioners judge the N. F. IV by their knowledge concerning the N. F. III, which is freely acknowledged to be far inferior to the N. F. IV, which is a book of legal standards that was prepared to meet such application of it. Unfortunately, the treasury of the A. Ph. A. is not overflowing with funds, hence some other source of funds must be sought to carry out the recommendations of Mr. Beringer, which suggestion was finally passed upon favorably at the Atlantic City, N. J., meeting in 1916. This disposition of the matter

was necessitated by the action taken by the Association at its final session at the Detroit, Mich., meeting, where an apparently diplomatic move to dispose of it was taken, with the result that the Council could not make any move to inaugurate a movement to give the publicity of the N. F. IV that its superiority over the N. F. IV warrants.

Possibly the A. M. A. may have facilities at their command which they will offer upon solicitation of the A. Ph. A. officials, whereby the desired publicity for the N. F. IV can be obtained. I make this suggestion for whatsoever merit it may contain.

PRACTICAL DRUG CONSERVATION.*

BY AMBROSE HUNSBERGER.¹

The question of conserving drug store supplies during a national war crisis such as the one through which we are passing at the present time would seem to demand the most profound consideration and unflagging persistence of the practicing pharmacist in its solution. It is peculiarly a problem for the pharmacist, inasmuch as he ought to be in the best position to recognize the limitations which will maintain drug conservation within the bounds of common sense without sacrificing efficiency, and he should further be able, by virtue of his practical experience, to determine the line of least resistance to be followed in order that the most helpful results may be achieved in the shortest possible time.

When we stop to consider the close relationship of the pharmacist with the public, we are readily able to recognize his obligation in that direction, and it becomes apparent that whatever he can do in the way of curtailing the communal encroachments involved in the practice of his calling, should be done without the slightest delay. Of course, the thought suggests itself concerning a reciprocal obligation on the part of the public. If it is not a recognized principle now, it will be, probably soon, that many things which are considered indispensable necessities under normal conditions of living, become distinctly non-essentials, if not positive luxuries, during periods of stress and strife. This principle is quite as applicable to the production of drug supplies as to that of any other commodity consumed by the public, and so applied, means relegating to the back top shelf, for the period of the war, many of the "elegant pharmaceuticals" and nostrums, some of which are said to make therapeutic efficiency a secondary consideration at best. What if the tonic elixir does appeal a little less to the eye, nose, and palate, or the cough syrup is only half as cloyey, or the stomachic loses a part of its alcoholic tang, and the favorite digestant temporarily foregoes its emulation of the far-famed cordial of the Benedictine monks—the esthetic must sacrifice itself on the altar of practicability, and it is reasonable to presume that our loyal public will accept its obligation in the matter of conserving drug supplies, which are difficult to secure, when it is made clear that the heaviest demand upon the restricted substances is created by the effort to appeal to its finicky palate.

As regards the problem before us, it may be said that practical conservation in the drug store includes restriction in the use of many articles which under normal conditions are used in enormous quantities without any special thought being given to the availability of future supplies. A brief list (excluding substances employed

* Read before Philadelphia Branch, A. Ph. A., February meeting, 1918.

¹ President Philadelphia Branch A. Ph. A., 1917-1918.

in the manufacture of galenicals) includes bottles, jars, tins, glass and paper boxes, paper and metal caps, extra wrappers, outer cartons, special seals, etc., some of the latter are designed to provide greater security of contents, but perhaps most of them calculated to lend an air of distinctiveness to the package—a commendable procedure normally but one that should be eliminated in war time. Conservation of containers may be practiced by reducing the variety of sizes in bottled or boxed substances, since in most instances the public will adjust itself to a small emergency package intended for immediate use and a larger so-called family size for continuous use. This would do away with the myriad of intermediate-sized packages of household drugs and chemicals, toilet articles, etc., and would release a large volume of paper, glass, and tin containers, allowing the material and labor required in their construction to be used for more urgent purposes. Where is the need of offering cold cream in four sizes, or talcum powder in two sizes of four odors each, or skin lotions and creams in 25 cent, 50 cent, and \$1.00 sizes? Why not, as regards the latter, eliminate the medium size; or still better as a war measure, retain the medium size and release the other two? In other words, instead of applying the old maxim about making "two blades of grass grow where one grew before," reverse its principle and paraphrase it to have "one bottle blown where two were blown before" and apply the principle to each detail of pharmaceutical practice. To be sure, this may not seem to accomplish a great deal in the way of conserving the resources of our country when viewed from the individual standpoint, but if we stop to consider that fifty thousand pharmacists throughout the country can put the plan into operation within a very brief period, the potentialities of the suggestion become more apparent.

While the shortage of materials needed for the manufacture of containers and other drug store accessories is serious in itself, it is second in importance to a consideration of ways and means of curtailing the use of substances which directly affect our supply of food, munitions, and essential medicinal substances. Chief among these may be mentioned alcohol, glycerin, sugar, and certain vegetable drugs and chemicals.

The control of these supplies is perhaps best discussed by a classification of methods, as follows:

Conservation by elimination,

Conservation by substitution,

Conservation by coöperation of medical profession.

In the first classification is included the suggestion above outlined as regards containers, etc., and also certain remarks to follow under the last classification.

Conservation by substitution presents several angles, *viz.*, the substitution of sweetening agents such as honey, glucose, etc., for syrup, and the use of saccharin for the same purpose, and the substitution of glycerin for alcohol, syrup for glycerin, aromatic waters for syrup, etc. The first angle does not appear to accomplish much more than to shift the burden from the right hand to the left, inasmuch as either or all of the substances suggested as sugar substitutes are equally as adaptable to domestic use and should therefore be left available for that purpose. In the second angle it may be said that the judicious substitution of saccharin as a sweetening agent for medicinal substances is perhaps permissible in some instances because this substance is not fitted for indiscriminate use in food products. The third angle of the proposition is discussed later.

Conservation by coöperation of the medical profession appears to offer the solution that promises to achieve the quickest and most beneficial results. Since the art of pharmacy exists primarily for the purpose of supplying the needs of the sick as seen through the eyes of the medical profession, does it not seem feasible and proper to ask coöperation of that body in the campaign for conservation of drug supplies, and can there be a lurking doubt that the coöperation asked for would not be granted, enthusiastically and freely. It is probably safe to assume that the medical profession would welcome any suggestion which might point a way for them to still further advance the interests and safeguard the physical welfare of the citizens of our country.

The best reason for this assumption of coöperation rests upon the fact that the medical profession of our country has outstripped any other single body of citizens in its devotion to our country's cause in the present war. Medical practices developed by years of application, lucrative incomes which they yielded, near realization of ambitions for professional advancement, fond domestic and social ties, assurance of comfortable futures—all were relinquished promptly and unselfishly by thousands of our medical practitioners when the call came and they placed their abilities and energies unreservedly at the disposal of our Government. To make such acknowledgment of the splendidly patriotic attitude of our medical men, in and out of the service, is directly related to our discussion, and were it pure digression, it would still be entirely pardonable because one would have to be churlish, indeed, to have enjoyed the cordial friendship of many of these manly men and fail to fully and freely commend the fine quality of their citizenship.

Assuming, then, the patriotic coöperation and receptive attitude of the medical practitioners of the United States in the matter of conservation, it becomes incumbent upon the pharmacist to furnish the information that comes to him in his daily practice regarding fluctuations in supplies and prices of drugs, to direct attention to declining stocks of certain ones and the possibly increasing supplies of others previously curtailed, to discuss tested substitute products for those unavailable as well as for those which, by virtue of controlled supplies achieve extortionate, if not, prohibitive prices, to advocate reductions in the size of prescriptions calling for scarce drug and chemical products and to encourage curtailment and, whenever possible, entire elimination from prescriptions of such ingredients as syrup, glycerin, and alcohol, singly or in combination, when they serve no more laudable purpose than an appeal to a frivolous or jaded palate.

Personal experiences furnish concrete examples of the practical results which may be obtained through intelligent and (in these times) patriotic coöperation between physician and pharmacist. For years a well-known oculist ordered one grain of his favorite mydriatic in a fluidrachm of distilled water. When informed that supplies of the substance were running low and the cost mounting high, he changed his formula to one-third grain mydriatic in twenty minims of distilled water, with entire satisfaction to himself and his patients and proud of his achievement in conserving two-thirds of his normal consumption of a rare chemical. Another practitioner was in the habit of prescribing from four to six ounces of compound tincture of benzoin, with the directions to the patient to "add two teaspoonfuls to a pint of boiling water and inhale the steam." When informed of the difficulty involved in procuring cer-

tain ingredients contained in this preparation, he reduced his order to *one* ounce of tincture with directions to "add *fifteen* drops to *one* cup of boiling water."

Another changed his favorite combination of ammonium chloride and syrup of lactnecarium to one containing an equal dose of the active ingredient in a vehicle consisting of one part syrup and three parts anise water, with no noticeable sacrifice of therapeutic efficiency, according to his statement. Still another has been securing results with a capsule of terpin hydrate and heroin that are quite comparable with those he formerly observed when using the elixir containing the same substances. He is justly proud of the fact that he is a practical conservationist, and the available supply of alcohol, glycerin, and sugar, is automatically maintained.

A final reference to the ready compliance of still another practitioner with the suggestion that an ointment used in rather generous quantity might serve equally well as a protective coating if petrolatum were employed as a vehicle in place of benzoinated lard, points the way to conservation of animal fats.

It is said to be difficult indeed, to attempt to measure the relative difference in therapeutic value between a dose of terpin hydrate and heroin administered in pill, powder, or capsule form, and a dose of the same substance administered in the vehicle provided in the formula for Elixir Terpin Hydrate and Heroin, and it would seem to require equal temerity to attempt to demonstrate that ammonium chloride was any less effective as an expectorant given in cinnamon water than it is when dissolved in syrup of lactucarium, or that pepsin extemporaneously dissolved in compound infusion of gentian lacked any of the digestant qualities ostensibly possessed by the same substance when exhibited in more delectable vehicles. Indeed, the deeper one delves into the question of conservation in the drug store, the more one is inclined to the thought that, while upon the surface the necessity for conserving certain supplies may require more or less readjustment, as a matter of fact, rational therapeutics properly supported by rational pharmaceutical practice, to a great extent solves the problem, and if the rational practice of these two arts shall become a fixed habit, the national emergency that actuated the readjustment will have been, indeed, a blessing in disguise to the practice of pharmacy.

While it is perhaps true that all medical practitioners will not receive this method of applied drug conservation with enthusiasm, or even with cordiality, it is probably a fact nevertheless that an inestimably greater number will be governed by the need of the hour and welcome this additional opportunity to promote the interests of our country by assisting in the conservation of its resources as far as lies in their power.

Space does not permit a systematic arrangement of the most prescribed substances but a suggestion as to the possibilities involved is obtained by a brief reference to but a few classes of substances, with conservation forms of administration.

Salts of ammonium, potassium, sodium, calcium, strontium can be dispensed in aromatic waters, with or without the addition of from 10 to 25 percent of syrup. Salts of mercury, strychnine, etc., opium and alkaloids, etc., can be dispensed in pill or capsule form; cinchona alkaloids, etc., in capsule pill or wafer; digestive agents in powder or capsule; vegetable drugs, in capsule, powder, pill, or infusion; antipyretics (coal tar) in capsule, powder, or wafer.

This brief scheme is, of course, susceptible of unlimited extension and numberless variations, and from that standpoint may be criticized as being cumbersome and complex. The fact is, however, that the individual medical practitioner is interested only in the remedial agents which he is in the habit of prescribing, and the facility with which he will master a system which will eliminate the restricted substances from his prescription will be governed by his interest in the matter. It is not to be gainsaid that here and there substances exist which, by virtue of their physieal characteristics, render imperative the use of alcohol or glycerin in their preparation for use, or the addition of sugar to facilitate administration; but their number is negligible and the quantity of the above-mentioned substances can probably be spared to that extent for pharmaceutical purposes. Under any plan of conservation a portion of these substances will have to be retained for certain pharmaceutical uses, such as solvents, preservatives, etc., if the practice of pharmacy is to continue throughout the war; and the pharmacist's title to this portion is less likely to be questioned if he limits his requirements thereto and refrains from encroaching upon the domestic domain for substitute sweetening agents such as honey, molasses, glucose, etc. It is among the possibilities that domestic need for the latter may even become acute, pending the termination of the war.

The foregoing thought suggests the chief objection to be found with the proposed plan of conserving drug supplies by adopting War Emergency Formulas to be used in place of our official standards. Many of the suggested substitute formulas provide for the use of substances which are no more plentiful nor any less in demand than are the articles they are designed to replace. This plan of conservation seems therefore to be not altogether an unselfish one. The second objection to War Emergency Formulas lies in the cumbersome nature of the plan and the endless complications likely to result from extemporaneous prescription combinations of these more or less untried formulas. The final count against the plan is the fact that if it is to be successfully operated, precisely the same effort will be needed to enlist medical coöperation as in the writer's plan, without securing nearly as beneficial results.

As a concrete example of the potentialities of the conservation plan proposed by the writer, Elixir Terpin Hydrate serves well. Only one four-ounce prescription for this preparation dispensed in each drug store in the United States consumes between seven and eight hundred gallons of alcohol, more than three tons of glycerin, and about one ton of syrup. If the active ingredient of the preparation, terpin hydrate, is administered according to the writer's suggestion, in powder, pill, or capsule form, there is saved to the country a volume of the ingredients composing the elixir proportionate to the number of prescriptions so changed. And therein lies the principle of conservation by coöperation with the medical profession. It presents an obligation for rational pharmacy and therapy. How shall the obligation be met?

WAR EMERGENCY FORMULA FOR SODA FOUNTAIN SYRUP.

BY F. A. UPSHER SMITH.

Although, by taking care, a very large amount of sugar now used in medicines can be saved, a moment's consideration will show that a still greater amount of sugar can be saved at the soda fountain. Without having accurate figures to go by, I should estimate that there are in this country three times as many soda fountains as there are drug stores. On this estimate there are over one hundred thousand soda fountains in the country, and if each one used three pounds of sugar a day, the annual consumption of sugar at the soda fountains would be over one hundred million pounds.

The question is, to what extent can we replace part of this sugar by glucose? I have prepared the following formula for the soda fountain and up to the present have found that it makes a very palatable drink with the various fruit flavors, chocolate, maple, etc.:

Granulated Sugar..... $4\frac{1}{4}$ pounds
 Liquid Glucose..... $2\frac{3}{4}$ pounds (or 1 quart)
 Distilled Water.....sufficient to make one gallon

Mix in pan, raise to the boiling point, stir until properly mixed, then strain into a bottle; when cold, cork and keep in a cool place.

The specific gravity of this syrup is 1.291. It is, therefore, lighter than U. S. P. syrup and is less sweet. But soda fountain syrups have always been made extremely sweet, if not too sweet, and it is possible, after a time, that a less sweet syrup will be more in favor through the gradual weaning of the people from their previous use of an excess of sugar.

It is impossible to say at this time what will be the keeping properties of this syrup; as far as I can judge, it will not keep so well as the official syrup. On this account it would be well, in trying it out, to make only sufficient for a few days, at the most for one week at a time, until its keeping properties have been well tried out.

This formula, as it stands, will save 44 percent of the sugar used at soda fountains, substituting for it a sweetening substance which has already been very largely used in candies and which in recent months has been used to a greater extent than formerly in the manufacture of ice cream.

It would not seem objectionable from any point of view to use glucose, because ordinary cane sugar when ingested passes through the glucose stage in the stomach before it is assimilated.

It is desirable that this formula be tried thoroughly in a small way in a large number of soda fountains so that the experience of many may help to improve it. At a time like this when sugar is admittedly scarce and when the homes are being denied their usual allowance of sugar, the soda fountain proprietors of this country are in a position to be of direct assistance to the whole population as well as to our Allies.

Now is the time to act. Try out this formula, improve it if you can, and do your best to use as little cane or beet sugar as possible at the soda fountain during the remainder of the war.

Do not put off a trial of this formula. Act now. If you do not, you are not a true patriot.

PARAFFIN FILMS AND OIL DRESSINGS.*

BY WILLIAM J. BONISTEEL.

The war has brought out a number of new things which are of great interest to pharmacists. The value of the Carrel-Dakin solution is well known while the new method of treatment of burns by paraffin films and oil dressings is not so generally known. The history of paraffin films no doubt dates back to the first use of carron oil for burns. We know that in this treatment the action and principle is superficial, merely keeping the affected parts free from direct contact with the air. Recently it has been found that a similar action is obtained through the use of thin films of paraffin which, when applied to the skin, offer the maximum of protection to the burned areas or exposed tissues. In addition to protecting the skin the use of paraffin films offers certain other advantages, *viz.*, ease of removal as well as acting as a sort of scaffolding for feeble granulations.

Recently there has appeared on American markets a French preparation, called "Ambrine," of secret composition. Some very sensational reports have been circulated relative to its marvelous properties. In this country, as was to be expected, certain proprietary preparations of secret composition have also appeared upon the market, all more or less alike in composition and the principle of action the same. If the principle of the films is a good one, the question arises: are the above named preparations the best? Being of secret composition we know of no place to start to improve them. Therefore we have to start in with paraffin and work on them as we go along.

The object of this paper is to show the method of manufacture and the simplicity with which they may be employed. The most important work in this country on the paraffin films is the work of Dr. Torald Sollmann,¹ of Western Reserve University, who has carefully investigated the subject and reported his results. The films should be simple and consist at most of not more than two ingredients so they can be prepared independently and if possible extemporaneously by any pharmacist and thus be available to any physician or surgeon who cares to try them. In working with films experimentally it is advisable to refrain from adding any deodorant, antiseptic or coloring matter since the first step should be the suitability from a mechanical standpoint. After suitable types are found then it is an easy matter to modify them by such additions as one deems necessary.

The melting point of paraffin films should not be lower than 48° C. nor more than 53° C. Within this range the melting point is immaterial, it being well to bear in mind that the harder the wax the more firm the support, while the softer ones are more soothing. The ductility or resistance of a film against stretching may be determined by comparative tests. Pliability or resistance to fracture on bending is important also. The more fragile films will break at a relatively high temperature while the more plastic films can be bent at a relatively low temperature.

General methods of preparation: Paraffin alone is seldom used since it easily crumbles. Mixtures of paraffin and related mixtures are generally used. Such

* Read before the joint meeting of the Detroit Branch of the American Pharmaceutical Association and the Prescott Club of the College of Pharmacy of the University of Michigan, February 14, 1918.

¹ See June 1917, issue, p. 555.

substances have the property of giving the film their elasticity and durability. The mixtures are prepared by melting the ingredients on a water bath, after which the mixtures are heated to 145°C . for sterilization. After the preparations are melted on a water bath a teaspoonful of melted wax can be poured upon the surface of water at the temperature of about 40°C . This makes very satisfactory films suitable for small area. For larger sheets a piece of plate glass can be used which has been warmed in a water bath to a temperature of about 40°C ., then melted paraffin is poured on the glass and spread with a hot spatula, then immersing the plate immediately into water at a temperature of about 40°C ., the film softens and then can be lifted off with a spatula. However, any method that will yield satisfactory films can be employed.

The melting-point determination can be carried on by the U. S. P. method or any other melting-point method which yields satisfactory results. Hardness can be determined by a comparative method, *viz.*, by seeing which cake will indent the other. The strength can be determined by immersing them in a water bath of 38°C ., kneading and pulling, noting their coherence, etc. The temperature at which the film breaks can be determined by the same method. At high temperatures the films can be doubled without breaking. This temperature varies for different films. The lower the temperature at which the film begins to break on bending or pulling the greater is the pliability or ductility. It is quite desirable that the film should have a low melting point and thus remain pliable at a low temperature. Clinical trials will introduce new conditions so that the usefulness of the various preparations cannot be judged altogether from physical results. The cost is relatively low. Paraffin, the main ingredient, is at present about 20 cents a pound. Dr. Sollman has made a very extensive classification and divided them into five large classes arranged in the order of hardness, giving a number of formulas under each class in the order of preference. However, for this paper I will take but one of each class.

Class 1.—Simple paraffin. Any suitable brand on the market will do, the softer varieties being preferred. It would be well to experiment with many of the makes on the market. The membranes detach beautifully and it seems very promising, except that it is very brittle and crumbles easily. This should be used where a very stiff film is desired.

Class 2.—Paraffin wax and related mixtures, consisting of about 90 percent of paraffin and the balance can consist of resin, spermaceti and stearic acid. The proprietary mixtures usually belong to this class.

Class 3.—Paraffin-asphaltum mixtures. These are more pliable, more adhesive, and can be made into thinner films. Whether advantageous or not is open to question. Paraffin and asphalt do not form perfect mixtures, hence must be stirred. Ten percent of asphalt varnish is mixed with the paraffin but since the composition of asphalt is complex no further experiments were made.

Class 4. These are paraffin oil mixtures and the most promising is the mixture with the addition of 10 percent oil of theobroma. Then comes liquid petroleum and olive oil. Venice turpentine and castor oil do not seem to yield good films, although their application might be desirable. As high as 20 percent of cacao butter and the same percent of olive oil is mixed with paraffin. These films

being somewhat emolient, would be perhaps desirable in the early stages of treatment.

Class 5.—Paraffin and petrolatum mixtures. They are somewhat different, being very soft, greasy and crumble easily. Ten parts of paraffin and two parts of petrolatum form weak but manageable films. On very sensitive surfaces this might be desirable.

Application to the skin: The series of preparations were applied to the skin in the same manner in which they would be used clinically. A strip of skin about an inch wide was painted with the melted wax, on this was laid a very thin layer of cotton, and over this was painted another layer of the wax. The adjacent strip of the skin is now painted with the second preparation, and so on. This is a very suitable method for clinical comparisons. However, in actual practice the whole area is covered with the melted paraffin and covered with a thin layer of cotton and then more melted wax is added.

The preparation and properties of paraffin film mixtures suggests their most important properties from a therapeutic standpoint. Several degrees of hardness might possess advantages under various conditions. Pharmacists should call to the attention of the physician this method of treatment and urge him to use simple preparations of known composition so that results can be compared, deficiencies met and improvement made. Clinical experiences may show the advantages of the addition of simple combinations such as scarlet red, resorcin, eucalyptol, and other healing essential oils.

In the same field of paraffin films comes up the question of the use of paraffin oil on surgical dressings. These are prepared by saturating the gauze with a soft paraffin mixture made by the addition of liquid petroleum, lanolin or stearic acid to paraffin. Perhaps the best results that are on record are obtained by the use of liquid petroleum. The great advantage of a non-adhering surgical gauze is due to the fact that the blocking of the fibers prevents matting from secretion and the non-adherence of the gauze. These gauzes can be easily prepared and can be sterilized with heat after impregnation.

This same principle can be used to make cotton sponges. Demonstration shows that cotton sponges wrapped in oiled gauze absorb viscous fluids much better than when wrapped in plain gauze. The technic of making of absorption tests is as follows: One gramme absorbent cotton as a sponge is wrapped in a piece of gauze 12 cm. square; egg white and egg yolk were used to represent wound discharges. This is placed in a flat bottom pan to a depth of 2 to 3 mm. and in this were placed the sponges previously weighed. Results can be recorded upon a chart and the number of grammes absorbed recorded. The result of a few summaries from a chart based on the above technic is as follows:

1—Sponges made of compressed cotton (cotton can be easily compressed in a letter press) absorb much better than those made of loose cotton.

2—Sponges wrapped in loose-mesh fabric absorb better than those in close-mesh fabric.

3—Sponges covered with gauze impregnated with liquid petroleum absorb better than those with plain gauze.

4—Sponges with cotton absorb better than those filled with powdered charcoal.

The most favorable influence of the oil gauze is explained by the protection that the oil furnishes against swelling of the thread and the consequent obstruction of the mesh.

The above uses of paraffin immediately suggest its use as a covering for bandages. The bandages can be dipped in melted paraffin and applied directly to the wound, this being somewhat analogous to a paraffin film although it differs in some essential respects. The finished dressings can be painted with melted paraffin, the bandages stiffened so as to form a support and this in some cases may take the place of a splint or even a cast. However, it is somewhat weaker and more pliable but has the advantage of lightness. The edges of dressings can be painted with melted paraffin so that bandages do not slide upon themselves. Moisture and dirt are kept out. The fraying that one notices on bandages after being worn a little while can be prevented by coating the edges with paraffin. These bandages can be easily removed with the scissors. The end of a bandage can be sealed by paraffin, doing away with the use of adhesive plaster. Countless other uses can be made of paraffin, such as the coating of labels on bottles. It is hoped that the ideas set forth here will be of service to pharmacists in presenting new ideas to the medical profession and at the same time be a source of revenue to them, not only from a financial standpoint but from the added prestige gained through presenting something to aid suffering humanity in general.

DR. FRANK CRANE'S COMMANDMENTS OF SALESMANSHIP.

9. Think Success.—Success begins in the mind. Why think fifty cents, when it is just as easy to think fifty dollars? Tell success stories, not incidents of failure and hard luck. Radiate prosperity. Feel prosperous. It's catching. Keep your chin up.

10. Be Human.—The reason you are hired to sell goods is that you are a human being. Otherwise your employer would have sent a catalogue. So be a human being, likable, engaging, full of human electricity. For I patronize as a rule the salesman I like.

Selling goods is the greatest business in the world. It takes all there is in a man. You need to know psychology, you need tact, intelligence, self-control, courage, persistence and inexhaustible good humor. It is not a job for a second rater. You simply have to make good or go under.

I admire a good salesman because I never was able to sell anything in my life. But I'm a good buyer.—Dr. Frank Crane.

PRESCRIPTION CLINIC.*

SHOWING SOME INCOMPATIBLE AND SOME UNUSUAL PRESCRIPTIONS.

BY CHARLES H. LAWALL AND IVOR GRIFFITH.

| | | |
|-----|---------------------|----------------|
| (1) | Sodium Borate..... | 1½ drachms |
| | Acid Salicylic..... | 1 drachm |
| | Glycerin..... | 10 fluidrachms |
| | Syrup to make..... | 4 fluidounces |

No matter how this prescription is compounded a chemical change is bound to occur between the sodium borate and the glycerin with the formation of boric acid and sodium metaborate, both of which would be soluble in the menstruum of glycerin and syrup. This reaction is stated to be progressive but is hastened when heat is used in the manipulation.

The thoughtless way of compounding this prescription would be to triturate the solids with the glycerin and add the syrup and dispense the mixture with a "shake well" label disregarding the floating needles of undissolved acid. Two ways of compounding this prescription suggest themselves to us:

In the first, salicylic acid is dissolved in a very small volume of alcohol and the borax is dissolved in the warmed glycerin. The two solutions are mixed and the syrup then added. A perfectly clear solution results.

The other method is to dissolve the salicylic acid in 5 fluidrachms of the glycerin, heated on a water bath and the borax in the rest of the glycerin, also heated. These two solutions are mixed and enough syrup added to measure 4 fluidounces. Both methods produce apparently permanent solutions.

| | | |
|-----|-------------------------|----|
| (2) | Quinine Bisulphate..... | 2 |
| | Phenol..... | 1 |
| | Glycerin..... | 4 |
| | Distilled Water..... | 60 |

Compounded in any manner, strictly according to this formula, a crystalline precipitate is bound to occur after the product has stood a while. This precipitate or rather tufted masses of crystals, on examination, proved to be alkaloidal quinine.

The addition of an excess of an acid which gives soluble salts of quinine, prevents the formation of this precipitate. Lactic acid which lately has been frequently and successfully used in the treatment of seborrhoea seems the logical one to use. Addition of this acid inhibits the production of a precipitate, and while no trial was made with the substitution of dilute alcohol for the distilled water, such a change, it would seem, would also prevent this precipitation.

| | | |
|-----|----------------------------------------|---------------|
| (3) | Sodium Nitrite..... | 20 grains |
| | Sodium Citrate..... | |
| | Sodium Bromide..... of each | 2 drachms |
| | Compound Digestive Elixir..... to make | 3 fluidounces |

* Presented before Section on Practical Pharmacy and Dispensing, Indianapolis meeting, 1917. Most of the prescriptions were further discussed by the authors, and also by E. A. Rudiman, W. H. Glover, C. P. Wimmer, L. C. Hopp, Carl Whorton, Louis Saalbach, Frank Schachleiter and R. W. Terry.

Every combination was tried in order to hasten the reaction which occurs in the compounding of this prescription. Effervescence does not totally cease for from 36 to 48 hours. Tests of the mixture after it had stood several days proved the presence of a nitrate, non volatile and volatile nitrites and the turbidity of the product was due to the salting out of the digestive ferments in the elixir.

There is no way, within our ken, of overcoming the incompatibility of this prescription.

| | | |
|-----|------------------------------|---------------|
| (4) | Sodium Salicylate..... | 2 drachms |
| | Hexam..... | 1 drachm |
| | Spirit of Nitrous Ether..... | 2 fluidrachms |
| | Water..... to make | 2 fluidounces |

When this prescription is filled, contrary to expectation, it develops a peculiar brownish black coloration which deepens perceptibly on standing. If the spirit is decidedly acid one may look for crystals of salicylic acid in the mixture. This could probably be overcome by neutralizing the spirit. Another possibility is that nitrosalicylic acid may be formed in the mixture. The hexamethylenamine is apparently unaltered unless such a change will occur after the mixture has stood a while. We have not been able to determine the cause of this development of color.

| | | |
|-----|----------------------------------------|------|
| (5) | Theobromine and Sodium Salicylate..... | 2 |
| | Sodium Iodide..... | 4 |
| | Corrosive Mercuric Chloride..... | 0.65 |
| | Distilled Water..... | 60 |

Snap judgment in this particular case is liable to lead one astray. The sodio-mercuric iodide formed in the prescription, presumably should, like Mayer's reagent precipitate alkaloids. We are taught however that the dimethylxanthine group, consisting of caffeine, theobromine, and others, are not precipitated by this reagent. Acting on this presumption we accordingly fill this prescription and send it out a clear transparent solution. It is brought back in a day with a white precipitate. This precipitate contains theobromine and mercury. Caffeine citrate in the same combination gives no precipitate. Perhaps we have discovered a new differentiating test between caffeine and theobromine, we shall pursue this subject further but give the example as a warning.

| | | |
|-----|------------------------------|------------|
| (6) | Quinine Sulphate..... | 1 |
| | Potassium Acetate..... | 6 |
| | Aromatic Sulphuric Acid..... | sufficient |
| | Syrup of Lemon..... to make | 90 |

The potassium acetate is quickly dissolved in one-half of the syrup. The quinine sulphate, with the aid of a few drops of the acid is dissolved in the rest of the syrup and the two solutions are mixed. The result is a heavy, bulky precipitate of quinine acetate.

This prescription was compounded in this way, in a certain drug store, and the patient returned it with a request that it be transferred to an ointment box, so that it could be administered with less trouble.

Using simple elixir in place of syrup of lemon modifies the difficulty somewhat, although it does not correct it altogether.

- (7) Thymol Iodide..... $\frac{1}{2}$ drachm
 Wool Fat..... $\frac{1}{2}$ ounce
 Cottonseed Oil..... to make 6 fluidounces

This is a favorite prescription with an eminent Philadelphia physician. He reports several "messes" as the result of careless and thoughtless filling of this recipe.

The proper way and a way that is always productive of perfect admixture is to dissolve the thymol iodide in part of the oil and the melted wool fat in another portion. When the latter is cool the two solutions are mixed and the preparation thoroughly shaken. It does not produce a perfect solution.

- (8) Strychnine Sulphate..... $\frac{1}{2}$ grain
 Tincture of Digitalis.....
 Tincture of Strophanthus..... of each $\frac{1}{2}$ fluidounce

A turbidity at first, and afterwards a precipitate appears on compounding this prescription. Using a fat-free tincture of digitalis avoids this complication to a certain extent.

- (9) Glycerin.....
 Solution of Hydrogen Dioxide..... of each 2 fluidounces

It was recently stated in one of the drug journals that this combination on standing a few days, developed oxalic acid, that is, the glycerin was oxidized by the dioxide. As a matter of fact the solution which was on exhibition was made some five or six months ago and when tested recently showed no evidence whatever of oxalic acid. Assay developed the fact that the peroxide in the solution still retained its full volume of available oxygen. This is another evidence of what is too often seen in the way of criticism. The graphitic cellulose method of criticising prescriptions is a very unsafe way to attain accurate results.

- (10) Sodium Bromide..... 4 drachms
 Elixir of Pepsin and Rennin Compound
 to make..... 2 fluidounces

After standing a few hours a peculiar turbidity manifested itself in the solution, later depositing as a slimy, gelatinous precipitate. This was probably the rennin and pepsin with impurities salted out by the sodium bromide. The addition of an acid did nothing to prevent this precipitation. As a matter of fact the addition of an excess of ammonia water was the only way whereby the precipitate could be redissolved; and this being destructive of the enzymic action would be impermissible.

It is only the unsightly appearance of the product of the prescription that calls for comment, since it can well be dispensed as it is with a "shake-well" label.

- (11) Acetphenetidin..... 10 grains
 Quinine Sulphate..... 20 grains
 Aromatic Sulphuric Acid sufficient
 Syrup of Citric Acid or,
 Aromatic Elixir to make 2 fluidounces

There is no incompatibility in this prescription. Notice however is to be taken of the fact that the marked fluorescence which is usually exhibited in this acid solution of the quinine salt is practically absent here. For some peculiar reason acetphenetidin prevents the occurrence of this phenomenon.

| | | |
|------|--------------------------|---------------|
| (12) | Aspirin..... | 1 drachm |
| | Potassium Iodide..... | 1 drachm |
| | Glycerin | 4 fluidrachms |
| | Anise Water..... to make | 4 fluidounces |

As one would suspect there is a fairly quick dissociation of the acid radicals of the aspirin in the product of this prescription due of course to hydrolysis. The aspirin loses its identity breaking up into acetic and salicylic acids, the presence of both of which was proven. The fine display of crystals exhibited in the one product as well as the grape-like form of precipitate shown in the other bottle are salicylic acid. Acetic acid and free iodine are present in the supernatant fluid.

| | | |
|------|------------------------------|---------------|
| (13) | Potassium Permanganate..... | 20 grains |
| | Phenol..... | 20 grains |
| | Glycerin..... | 4 drachms |
| | Distilled Water..... to make | 2 fluidounces |

Potassium permanganate in the presence of glycerin is immediately reduced to the black oxide of manganese and oxygen is liberated. This nascent oxygen will bring about a change in the composition of the glycerin and the phenol. This change, however, is probably very slow and need not be considered since there is no way of filling this prescription without bringing about the chemical change mentioned. It presents a clear case of an incorrigible incompatibility.

| | | |
|------|------------------------------|---------------|
| (14) | Quinine Sulphate..... | 15 grains |
| | Sodium Benzoate..... | 2 drachms |
| | Distilled Water..... to make | 3 fluidounces |

In the consideration of the proper means of filling this prescription, the use of an acid to assist in the solution of the alkaloidal salt is prohibited since such an addition would only create a new difficulty, that is, the releasing of the insoluble benzoic acid from its combination.

In attempting to fill the prescription we dissolve the benzoate in one fluidounce of water and the quinine salt as nearly as possible in the rest of the water. The two portions were then mixed. The result was the precipitation of the very bright crystal masses of quinine benzoate. The filled prescription reminds one very much of the old time miniature snow storm scene enclosed in a sealed glass bulb that aroused our curiosity in our younger days.

| | | |
|------|------------------------------------------|---------------|
| (15) | Sodium Benzoate..... | 3 drachms |
| | Solution of Calcium Hydroxide... to make | 4 fluidounces |

Precipitation of the slightly soluble calcium benzoate occurs here and is intensified somewhat the longer the bottle is allowed to stand. There is no way of overcoming this without an impermissible change in the formula. It can be dispensed with a "shake-well" label.

| | | |
|------|------------------------------|-------------------|
| (16) | Strontium Bromide..... | |
| | Potassium Citrate | of each 2 drachms |
| | Distilled Water..... to make | 2 fluidounces |

Quite a peculiar phenomenon occurs here. Dissolving the strontium bromide in a fluidounce of the water and the potassium salt in the rest of the water, then mixing the two solutions produces a precipitate which soon disappears. Shaking the bottle brings it back immediately and on standing a while the prescription looks

more like milk of magnesia than anything else. The insoluble precipitate of course is strontium citrate.

| | | |
|------|-----------------------|-------------------------|
| (17) | Menthol..... | 8 grains |
| | Quinine Sulphate..... | 20 grains |
| | Phenol..... | 24 grains |
| | Ichthyol..... | 2 $\frac{1}{2}$ drachms |
| | Hydrous Wool Fat..... | 4 drachms |
| | Castor Oil..... | 10 fluidrachms |

This prescription is reported to have given various results in the hands of different compounders and one will not be surprised at this. As the formula stands we can conceive of no way of making a permanently presentable and smooth product.

Substituting 15 grains of alkaloidal quinine for the salt and melting this with the menthol, phenol and ichthyol and incorporating this mixture with the solution of anhydrous (not the hydrous) wool fat in the warmed castor oil gives a permanently presentable and non-granular creamy liquid.

DISCUSSION OF OTHER PRESCRIPTION AND MANUFACTURING PROBLEMS.

The spare moments of the Section on Practical Pharmacy and Dispensing were given over to discussions relating to practical pharmacy:

ENTERIC PILL COATING AND CAPSULES.

W. L. SCOVILLE: An enteric coating for pills must be insoluble in the stomach and soluble in the intestines. Salol would be the ideal coating for this purpose, if it could be applied in an amorphous condition, but as the solvent gets in between the crystals of the salol there is no certainty that the pill will pass the stomach intact.

WILLIAM GRAY: We have never found a better coating than salol, but as Professor Scoville states this is not always satisfactory.

W. L. SCOVILLE: I carried on quite a series of experiments on gelatine capsules treated with formaldehyde several years ago. I found this: that if you take a one percent solution of formaldehyde, and dip the capsules, let them stay in this solution for not more than thirty seconds, take them right out and drain them and dry them, you have a condition that after about two weeks the gelatine has an enteric property; that is, it is insoluble in acid but is soluble in five-tenths percent solution of sodium carbonate. All experiments were carried out at a temperature of 37.5° C., at which they will dissolve readily in an alkaline solution. It looked very promising. I kept them for a year or two years. I tested them every three months, and while they dissolved up nicely in alkali, they refused to go to pieces in acid. They would swell but they would not dissolve. After a year and a half I began to find that the solubility in the alkali was decreasing. In other words, the process seemed to be progressive. The reaction, whatever it is, whether it is physical or chemical, in gelatine, goes on; keeps on increasing. At first it is very weak, and the capsules were not fit to be used for two weeks. Then they were all right for a year. We have used that process at the laboratory for experimental purposes—that is, where we could control it ourselves for enteric experiments.

By the way, Mr. Gray just asked me about using ipecac internally. I would like to state that if he wants to put ipecac in capsules and treat them that way, do not use them for a month, and then see that they are all used within a year, you will then get as good results as you can with anything. In hospital work that is thoroughly practical, but not for commercial work; it is unsafe to place a product of this kind on the market that is only good for a limited time.

PHARMACOPOEIAL AND NATIONAL FORMULARY PREPARATIONS.

R. W. TERRY: About a year ago I prepared some Compound Tincture of Cudbear; recently I had occasion to use some and found the caramel had separated out.

W. H. GLOVER: My experience with caramel of the market is unsatisfactory, hence I prepare it myself and do not experience the trouble indicated by Mr. Terry.

LOUIS SAALBACH: Much of the commercial caramel is not made from sugar but starch. (See p. 495 Vol. III and p. 1510 Vol. IV, JOURNAL A. PH. A.—Editor.)

CHARLES H. LAWALL: I use sodium carbonate in making caramel from glucose.

C. M. SNOW: We have had some trouble in the manufacture of Liquid Petroxolin, but we overcame the trouble by proper heating in a water-bath instead of on a water-bath.

W. H. GLOVER: In making Iodine Petroxolin formerly I found that after standing there would be a separation. I overcame this by using Russian oil.

C. P. WIMMER: Soft Soap, as now made is no longer green, and we have had some difficulty in making a satisfactory product by using the present formula.

LOUIS SAALBACH: I heard of an experience with soft soap which may be of interest. In making it according to the formula and following the directions as printed: "Dissolve 86 Gm. of potassium hydroxide in 100 mls of water in a capacious dish by the aid of heat. Immediately add 430 Gm. of cottonseed oil to the solution, and stir the mixture actively for a few moments. Then reapply the heat and, at first evidence of froth from boiling pour in 50 mls of alcohol, stir actively until the froth suddenly rises;" the mixture took fire and burned the operator who had followed these directions. My experience with this formula is not satisfactory. (Similar expressions came from W. H. Glover, C. P. Wimmer and C. M. Snow.)

C. L. EDDY: The Compound Solution of Phosphates formula calls for more than 1000 mls.

C. M. SNOW: This evidently is an error in the formula and the volume of water should be reduced.

(A discussion of Elixir of Gentian concluded the session. The point discussed was relative to the amount of Compound Spirit of Cardamom in the preparation which nearly all considered excessive.)

CATALYSIS.

D. W. Horn, in the Transactions of the Wagner Free Institute of Philadelphia, Volume VIII, p. 97, states that "contact underlies chemistry." He continues in saying, "Bodies may influence each other at almost incredible distances, but this action is physical, not chemical. Briefly, no contact, no chemical action. In the time-honored generalizations, of chemistry, its 'fundamental laws,' the action of pure substances upon each other was considered without reference to the effects of adjacent bodies. In some few instances, however, the effects of adjacent bodies were so striking as to compel early attention. Until recent years the multiplication of such instances has been slow. Such action or influence of an adjacent body may be covered by the term 'catalysis,' introduced by Berzelius, the famous Swedish chemist, in 1834.

"In 1836, Berzelius compiled all cases known in which, by the presence of a foreign body, a chemical reaction is hastened without the foreign body itself being changed. These foreign bodies thus acting he called 'catalysts.' Historically, catalysis is not a new phenomenon. Processes of fermentation were known to the ancients, and these involve catalysts. In fermentation by yeast, the yeast plant produces the catalyst, or enzyme, as it is more frequently called. In sharp contrast with chemical reactions that, when not catalyzed, proceed at so slow a rate as to produce less than

noticeable amounts of products, stand the reactions that are so rapid as to be practically instantaneous. Catalysis, of course, is not concerned with such reactions.

"It is not strictly true that a catalyst is found to be *unchanged* at the end of a catalyzed reaction. It is correct to say that the final products are the same, as they would have been had the catalyst been absent. The catalyst may be rather unmistakably changed, not in amount, but in physical state. Thus the crystalline manganese dioxide used to generate oxygen from potassium chlorate becomes a fine powder, and changes in physical state are known to occur in iron oxide and in platinum used as catalysts in other systems. The amount of the catalyst, no matter how small, seems to remain unchanged. Catalysts themselves may be accelerated or restrained in their rapidity of action. Two catalysts usually have a greater joint effect than either would have singly. 'Promoters' that increase the activity of catalysts are also known. Some substances so completely obstruct the action of catalysts that they have been called 'Poisons.' Enzymes and toxins have their poisons and antitoxins, and the analogy to them is quite close, even in the case of metallic catalysts. Some catalysts seem specific for a given reaction, but many are capable of manifold application, and no general method is known for guidance in selecting a catalyst for a given reaction."

SECTION ON EDUCATION AND LEGISLATION

AMERICAN PHARMACY.*

BY C. T. P. FENNEL.

Every true student of nature believes in a Divine Providence and in his precepts. Human nature as well as mundane have not changed since creation. Virtue and vice, with all the passions engendered by environment, remain as in the beginning and will remain the same to time everlasting. Natural forces determine the essential facts of history. Men of vision may show the way in which these forces are to express themselves, "As you sow the seed, so will you reap."

Let us keep this truism in mind and review our past history. The factors that enter into our discussion are many and are embodied in the great law of nature, the division of labor. Pharmacy and its followers, the colleges, law, associations, boards of pharmacy, the manufacturer, our national standard and the public, all contribute to this national institution, American Pharmacy.

Born and raised in an atmosphere of pharmaceutical endeavor with thirty odd years of experience in the business combined with my modest but sincere efforts in pharmaceutic training justify the privilege of expressing an opinion upon a subject which is touching the vanity of the American pharmacist.

First of all, let us not blind ourselves to facts, let us be honest with ourselves, the public and the Government. Claims of intellectual superiority for our calling avail us nothing. Efficiency must be proven. Can we do so? Are we entitled to recognition in the management of governmental affairs or not? Can we give force to the will, efficiency, courage and capacity to far-reaching plans?

What took place in Cincinnati seventy-five years ago, repeats itself in other centers of activity. Local activity becomes regional and finally national in character. I have been in touch with pharmacy since April 14, 1865, and have been a participant in the changes that have taken place.

Pharmaceutic history reveals the fact that in the early days pharmacy and medicine were under the influence of English thought and customs. It was but natural that such should be the case. Up to the Civil War, there was but little deviation from English thought, customs and practices. German influence was just beginning to manifest itself but became submerged by the natural forces produced as a result of the Civil War. After the Civil War, German influence became a strong factor both in medicine and pharmacy. In the early 70's it was the predominating influence and held its position until the early 80's, when American thought, customs and practices became the natural forces for the essentials of American pharmaceutical history.

EARLY EDUCATION STATUS.

Prior to the Civil War and during the reconstruction period, pharmacy and medicine were under control of truly professional men, broadly educated, not only

* Read before Section on Education and Legislation, A. Ph. A., Indianapolis meeting, 1917.

in their chosen calling but also in science generally, including history, language and literature. Their education represented foreign thought directly and remained under foreign influence. American individuality had not as yet materialized, notwithstanding the fact that the opportunities for the interchange of thought were extremely limited up to this time. The American "melting pot" had as yet not evolved fixed American institutions which form national characteristics. We fail to appreciate this fact, the then existing conditions, and wonder why these pioneers in American pharmacy and medicine held so tenaciously to foreign customs and practices. We wonder why these men kept in touch with European thought and progress and yet were put to their own resourcefulness under environments so vastly different from European. At that time it was the best thought and they recognized the value of the old teachings by the mere force of isolated environment. They builded thereon for a better and higher humanity.

One need but read their history and gracefully acknowledge them as true heroes of American medical and pharmaceutical progress. They fully recognized, as men of vision, their children's shortcomings in the opportunities in acquiring education in the broad sense, such as they had enjoyed upon foreign soil. The American centers where such might be acquired were few and beyond the financial reach of most of them. As a natural sequence, we find the inauguration of a kind of "round table education" involving all branches of the then existing sciences, supported by foreign literature received during very uncertain periods of time. The theoretical education thus imparted, non-compulsory but self-seeking, was under constant surveillance through a system of practical apprenticeship. Idealism so essential to true culture, and refinement suffered, but in its place we find the sturdy practical experience superiority founded upon self and producing national strength. This is clearly manifested by these men of vision in shaping their limited forces to yield the greatest amount of efficiency. They were in touch with every European progress, ready to accept or reject every advance made by methods of verification, observation and improvements. They lacked the means for the interchange of thought and it is only within recent years that we became aware of this fact. We are all too prone to look upon the past under present conditions.

AMERICAN PHARMACEUTICAL ASSOCIATION.

The men of vision realized that the opportunities for the interchange of thought had to be increased and they found the way for the expression of this natural force in the formation of the greatest association aiming at the highest ideals in American pharmacy. Notwithstanding its many trials and tribulations, be it said to the credit of this Association, that it has always maintained its constitutional ideals and at no time has its standard been lowered. Behind it has been the force of will, efficiency, courage and capacity for the preservation of its ideals. I deem it the greatest honor, and every pharmacist, no matter where located, should likewise deem it an honor to belong to this association, the American Pharmaceutical Association. This association is not alone national but also international in character and ranks second to none in the "World's Congress of Educational Institutions."

AMERICAN PHARMACEUTICAL ASSOCIATION PRODUCTS.

"Round table instruction" was succeeded by teaching institutions devoted to pharmacy and the allied sciences so far as they related to the practice of phar-

macy. In the very early period through the 70's these schools succeeded beyond expectation, the "round table instruction" had borne good fruit—a factor which was not sufficiently appreciated at the time. Records of those days prove conclusively that seekers of pharmaceutic knowledge were versed in English grammar; immaterial as to their nationality, they looked up to the teaching institutions of pharmacy as superior to themselves and worthy of the highest respect. They manifested this spirit in all inquiries for information through the channels of sealed letters couched in correct English. This material of preliminary education of "round table instruction," which was the basis of success of the old line pharmaceutical colleges, soon became exhausted and with its loss the educational success of the colleges decreased.

COMMERCIALISM.

The commercial phase in all lines of human activity made itself manifest about this time (early 80's) and likewise left its impress upon pharmacy. The practice of pharmacy as well as the teaching of pharmacy came under the dominion of commercialism. Exploitation of certain products not strictly in the domain of practical pharmacy, such as gelatin-coated pills, pepsin, malt extract, ergotin and so-called "elegant" preparations, was in its infancy but still upon a strictly ethical and hence legitimate basis. The future-seeing men soon recognized the drift of the times characterized as the "age of specialization." The old-time method of teaching in colleges of pharmacy continued, but soon proved to be on a faulty basis. The lack of general education and the lack of practical pharmaceutic knowledge failed in appreciation. Retrogression of discipline in reasoning power in an age of universal education and prosperity was considered an impossibility.

A NEW LINE OF PHARMACEUTIC COLLEGES.

The awakening finally came, but too late to overcome the position gained by commercialism. All efforts now centralized in pharmaceutic training devoted to theory combined with practical technique in the laboratories of the institution. The motive behind the movement shows true honesty of purpose and unselfish devotion to the progress both in the science and art of pharmacy but also short-sightedness in failing to recognize the value of true preliminary training and education.

The demands upon teaching institutions as to facilities, equipment and teaching corps increased tremendously and fostered a commercial spirit more intense than ever and not to the interest of true pharmaceutic education. This led unscrupulous men to the establishment of "diploma mills" and as a result the sincere efforts for higher pharmaceutic education suffered almost beyond redemption. The standard of pharmaceutic education and concomitant preliminary education became lower, cheaper and less secure, and as a sequence we have inherited the common knowledge of inferiority. The abuse of ethical principles affected the manufacture of pharmaceuticals in like manner. Exploitations of remedial agents to the medical profession and to the laity through the channels of the pharmaceutic calling destroyed all confidence once reposed in pharmacy. Intellectual progress in pharmacy became too general to be of any value. Abuse of every principle of common decency brought in the majesty of the law.

Men of education both in medicine and pharmacy visioned the inevitable result and hoped to maintain the welfare, health and happiness of the public by correcting all the evils by legislative restrictions. The intent again was sincere, primarily for the benefit of suffering humanity, but in reality for the restoration of medicine and pharmacy to their former standing. These legislative movements were encouraged by disinterested parties for the benefit of political influence and parties. This is proven by every measure enacted, for the means for the enforcement of acts are vague and lack sincerity of purpose. The enforcement of violations was left to men deficient in education or wholly disinterested and hence without knowledge of any nature pertaining to the practices of medicine and pharmacy; in charge of men forced to ignore moral courage in carrying out the spirit of the law. Measure after measure has been introduced under plea of higher education for the protection of the public, but all have been failures, more or less, for the one and single reason.

Schools of medicine and pharmacy multiplied without the "warrant of long-felt want," notwithstanding the restrictions placed upon facilities, equipment and teaching corps demanded long ago by law in almost every state of the union but opportunely enforced by the commissioner of education of the respective states.

STATE AND NATIONAL EDUCATION COMMISSIONERS

These general educational departments collect data of all kinds that have little bearing upon education. Teaching corps seem to be beyond their jurisdiction; education is a sham and a cheat unless carried on by able, accomplished teachers. The dignity of the profession of the teacher is beginning to be understood; the idea is dawning that no office can compare in solemnity and importance with that of training the mind. Institutions of learning, like human beings, are desirous of recognition, to be something or some one well thought of, and hence these institutions are diplomatic in answering all questions, relevant or otherwise, to the best of their knowledge and belief. Many of the institutions receiving state aid and having many interlocking departments of study, find it convenient to duplicate valuations and thereby show that the money appropriated through general taxation has been well spent.

The attempt of universities to corral students under the pleas of higher education and that of the poor boys' opportunity for education under a lower standard than that required for a university degree has not advanced education, pharmaceutical or otherwise. It cheapens true education and gives the impression of sham. History repeats itself as is shown by the excerpt from *Holinshed's Chronicles 1577*:

Cambridge and Oxford, two of the oldest institutions of learning in the world, were created by their founders at the first only for poor men's sons, whose parents were not able to bring them unto learning, but now they have the least benefit of them, by reason the rich so encroach upon them. And so far has the inconvenience spread itself that it is in my time a hard matter for a poor man's child to come by a fellowship. Such packing also is used at elections that not he which best deserveth but he that has the most friends, though he be the worst scholar is always surest to speed which in turn will end in the overthrow of learning.

State universities advertise instruction free to citizens of the state, but to my knowledge I know of none where this is true. Careful investigation proves that the expenses of these "free" courses average between \$60.00 and \$100.00 per

session to the resident students, an intended misrepresentation to the tax-paying public, known for their indifference and lack of study of economic questions affecting their welfare. All these institutions sail under two flags, those students of the university who never become pharmacists and those known as short-course students who do follow pharmacy; the former must be graduates of an accredited high school, the latter need not be; the first receive a university degree, the second do not, but they may get a certificate; the first get a broad education, the second a smatter of knowledge, usually sufficient for a board of pharmacy certificate. The first become representative men while the second seldom do, well aware of their own deficiency. I maintain that these school courses in pharmacy, and for that matter in any other branch of science, have lowered the standard of pharmacy directly and in the estimation of the public mind, indirectly. It is not a question of how good or how poor these courses of instruction are, but the psychological effect upon the human mind. That this effect is not to the interest of pharmacy, not to the interest of the teaching institutions, can easily be ascertained.

PHARMACEUTICAL ASSOCIATIONS.

Pharmaceutical as well as medical associations have discussed in conventions the many problems confronting them, educational and otherwise, affecting their welfare. After separating the many elements bound together, they finally resolve to do certain things or recommend that committees do justice to the recommendations adopted without offering the means for carrying out the contemplated acts. Members fail to recognize their importance as individuals or integral parts of the associations and in the reforms suggested. They fall into the profound but common error of mistaking the beginning for the end of the work. Financial as well as personal support is necessary to every movement and as neither is usually forthcoming, but little is accomplished and that little by a small minority of unselfishly devoted men.

The medical profession, notwithstanding its powerful and highly disciplined organization, has reaped the same experience, though much more successful in legislative movements. I believe a psychological effect to be responsible for this success since they recognized that legislation and resolutions did not cure the existing evils by subsequent action. Up to this period, physicians and pharmacists occupied the same plane of intellectuality and education, neither profession could claim educational superiority although the medical profession enjoyed a higher plane of intellectuality in the minds of the public. Medical men of vision were equal to the occasion and as a result of this vision we have "an exposé of medical education;" an enterprise carefully planned and judiciously fostered and which brought about true medical education; pre-medical education based upon thorough preliminary education, to be followed by the medical education.

Pharmacy has not yet reached this stage of development nor anything near like it, notwithstanding the institution known as the Conference of Teaching Faculties. One need but peruse their report of the annual proceedings and fully recognize the reason of their failure. What avails intellectual power without moral power?

CONFERENCE OF TEACHING FACULTIES.

The motive behind the movement is truly sincere, but the lack of moral courage to enforce the principles of organization has utterly destroyed the efficiency fos-

tering pharmaceutical education upon a worthy plane. The adoption of the National Syllabus without the adoption of the necessary foundation for its comprehension by students of pharmacy, nullifies every effort towards better trained pharmacists. As a fundamental principle, all members of the Conference must abide by the principles of organization without evasion of any kind under any pretext whatever in order to bring pharmacy to a state of governmental recognition. Sentiments of friendship or comradeship must not prevail. We still can remain friends and yet antagonize each other upon economic principles provided we learn to live more by reason and principle than blind sentiment. The Conference stands for high educational qualification and the enforcement of the principles of true higher education upon a uniform and united basis. This Conference should be the intermediary between the colleges of pharmacy and the boards of pharmacy. Those who cannot follow or will not follow the precepts laid down must step down and out publicly.

BOARDS OF PHARMACY.

Boards of Pharmacy were created to curb the activities of "diploma mills" and as such were considered as inspectors of the training performed by the teaching institutions of pharmacy. They have but one duty to perform, namely, to ascertain the fitness of the applicant to the practice of pharmacy. In recent years they have reached out for more power and authority, namely, the supervision of the quality of drugs. We need not discuss the motives that govern this desire or the desirability of such movement. Colleges of pharmacy may train students of pharmacy to assume all the responsibilities incidental to their supplying the public with drugs and medicines of proper strength and quality under the laws of the art and yet such students fail to receive the approval of boards of pharmacy in very many instances. The question is frequently asked why a college-trained student fails and the "quiz compend" student succeeds? It is not an easy matter to place the responsibility. All the factors that make up the pharmacy law of to-day are so closely interwoven that separation of the influencing factors becomes extremely difficult. Foremost, all the various state laws require practical experience in a drug store where prescriptions are filled and this implies that the products entering into the prescriptions, that is, the products of the U. S. Pharmacopoeia, are manufactured in that pharmacy, but unfortunately, this is now seldom the case. The commercial phase dominating all lines of industry reduces to a minimum the production of pharmacopoeial products in a pharmacy proper. Colleges of pharmacy were supposed to rectify this deficiency in manufacturing by a course of laboratory training, but unfortunately, the opportunities for repeated operations for the same product cannot intelligently exist in a teaching institution. Boards of pharmacy fail to recognize this fact which is clearly shown in all state board questions. Questions involving principles of action in the making of pharmacopoeial products seldom appear in the tests and hence the really qualified applicant gets no opportunity to express his fitness and must of necessity fail because he lacks the memorizing faculty demanded by boards of pharmacy as the criterion of fitness.

Some institutions shape their courses accordingly; they may reap a large percentage of successful candidates, but these will never be a credit to pharmacy

nor will they ever make any effort towards a higher and efficient pharmacy. The plea that some boards of pharmacy fail to require or to recognize preliminary education of pharmaceutic training offers no excuse for violating the cherished principles underlying a higher and truer American pharmacy. Colleges of pharmacy and boards of pharmacy are both sincere in their aims, namely, the advancement of the interests of American pharmacy, but unfortunately there is no real coöperation between them. Boards of pharmacy will remain supervisors of colleges, but as such they should go beyond their common functions and mutually interchange suggestions and work in harmony upon specifically agreed lines. The idea that a person is proficient in one state and not in another is simply preposterous. It discredits not alone the pharmacist but also the examiner.

UNITED STATES PHARMACOPOEIA.

Any one familiar with the official text for the practice of pharmacy must admit progress with each succeeding revision. The last or the ninth revision shows beyond question the most advanced progress over all other pharmacopoeias. The standard of identity and purity and the methods of determining purity and strength are so rigid and so exact and based upon the very latest approved methods, that this official text-book becomes worthless to the average American pharmacist of to-day. Is there any valid reason that such a condition should exist? Does the American pharmacist lack the training and knowledge necessary for the comprehension of the pharmacopoeial text or is it only indifference on his part due to a commercial phase? On the other hand, it has been questioned whether certain pharmacopoeial standards, such as the saponification value, iodine value of fixed oils, are safe criterions of purity; that assay methods under pharmacopoeial quantities are not real indices of strength; that outside of a few waters and syrups the pharmacist is restricted to hypercritical limitations not to the interests of the pharmacist nor the practice of pharmacy; that these restrictions are to the benefit of the manufacturer directly. Teaching institutions of pharmacy may devote much time and energy in putting these pharmacopoeial methods to practical application and test in their laboratories but when a spirit of indifference and lack of appreciation pervades the atmosphere of the preceptor, not much interest can be aroused in the student.

The common cry of practical pharmacy and practical pharmacists is fostered altogether too much and under the present status of enlightenment in all science can not redound to the interest of American pharmacy. The practical pharmacist of fifty years ago has no existence to-day. In his place we find the man of "Applied Science." Huxley says:

Applied science is nothing but the application of pure science to particular classes of problems. It consists of deductions from those general principles established by reasoning and observations which constitute pure science. No one can safely make these deductions until he has a firm grasp of the principles and he can obtain that grasp only by personal experience of the operations of observation and of reasoning on which they are founded.

Shall American pharmacy be pure science as represented by the U. S. Pharmacopoeia or shall haphazard, go-as-you-please methods prevail? The result depends solely upon educators.

THE MANUFACTURER.

The consideration of the manufacturer of chemicals and especially of pharmaceuticals has to my knowledge never been considered as a factor in the plan of pharmaceutical education. He has been ignored altogether, notwithstanding that he has spent millions in furthering the true science of pharmacy. He has searched the world over for crude drugs, determined their value in the interests of humanity by a corps of investigators of recognized ability. Self-preservation is the first law of nature and it is but fair to grant adequate returns to the manufacturer for commercial enterprise and financial sacrifice in his coöperation to the advancement of pharmaceutic knowledge. Rigid methods of purity and identity combined with demands of uniform and definite strengths are undoubtedly to his interest, commercially as well as scientifically. On the other hand, it is commercially and scientifically wrong for pharmacists to buy from the manufacturer in order to put the responsibility of identity, purity and strength upon his shoulders in order to evade food and drug laws. The very act is cowardly and an admission of the lack of confidence in self.

CONCLUSION.

The opportunities for the interchange of thought have become so general and cheap that any one, no matter what his station in life may be, can secure knowledge in any branch of endeavor without much effort. In contrast with fifty years ago, yea twenty years ago, we can discern the vast difference between past and present opportunities. In the past the means of acquiring knowledge were limited, expensive and not of access to the masses. Under the laws of human nature, this fact has awakened the faculties of the mind to appreciation and energy worthy of a fair measure of judgment of the true and false. To-day, for the same reason, this awakening does not take place and hence we need not expect the power of discrimination. Public opinion, the opinion of the masses, has no stability and for that reason is easily moved in every line of thought for the lack of reasoning power. External influences readily sway opinion favorable to-day but discredited to-morrow. Men's thoughts are much according to their inclination, to their learning and infused opinions.

Pharmacy and pharmacists have had more than their deserved share of abuse and hence it is not surprising that opinion is not very flattering to them. The art of thinking justly and strongly is not encouraged and hence the stimulus to intellect, reflection, reason and judgment are wanting. Pharmacy cannot be divorced from commercialism nor is it necessary. The fruits of unity, based upon intelligence accruing from education through reason, observation and experience will exalt both the professional and commercial phase of pharmacy. According to the Scriptures, "Grapes will not be gathered of thorns and thistles." Likewise, "Break up the fallow ground and sow not among thorns."

PROCEEDINGS OF THE LOCAL BRANCHES

CHICAGO.

Prof. Henry Kraemer of Ann Arbor presented a very fine illustrated lecture on "War and Microscopical Research," before the Chicago Branch, American Pharmaceutical Association, Thursday evening, March 14, at the City Club. Members of the Branch, their ladies and friends and a goodly delegation from the Illinois Microscopical Society formed a large and appreciative audience that greeted Dr. Kraemer most cordially.

About one hundred sat at dinner, preceding the lecture, in honor of Dr. Kraemer and as a farewell to Hugh Craig, President of the Branch who has resigned his office because of removing from Chicago to Detroit where he takes up new work.

Testimonials appreciative of Mr. Craig's good work and fine character were presented by Thomas H. Potts, James Crowley and W. B. Day. There was an expression of deep regret at our loss of Mr. and Mrs. Craig, accompanied, however, with an offer of best wishes to them in their new home and social circle.

In the short business session of the Branch, a very able and remarkably complete report of the Committee on Compulsory Health Insurance¹ was read by J. H. Wells in the absence of Chairman Beal. The report recommended that the Chicago Branch of the American Pharmaceutical Association refuse to endorse the standard bill proposed by the American Association for Labor Legislation and, in case such legislation is proposed in the State of Illinois, that the members of the Branch, individually and collectively, take an active part in seeing that the general public, and especially taxpayers, wage earners, and members of the medical profession and of the drug trade shall be fully informed of the dangers of state subsidized compulsory health insurance and of the results that have followed the establishment of such insurance in other countries.

E. N. GATHERCOAL,
Secretary.

DETROIT.

The regular meeting of the Detroit Branch of the American Pharmaceutical Association was held at the Wayne County Medical Build-

ing, March 15. Dr. Leschoier, a member of the medical staff of Parke, Davis & Co., gave a very interesting talk on vaccines and antitoxins. With the aid of a stereopticon, the steps in the preparation of these products were shown. The druggists were cautioned regarding the storage of vaccines and antitoxins, which, on account of their extremely delicate nature, must not be subjected to temperatures higher than specified on the containers.

Chas. F. Wendell, Display-Manager of the J. L. Hudson Company, told his audience that, as a class, the druggists' windows were not what they should be in order to make them yield the proper returns. But bearing in mind the points which Mr. Wendell named as the first essentials, Detroit druggists will soon rank as leaders in the art of window decorating. Since quality is the first consideration of a pharmacist, this must be demonstrated in the displays. Mr. Wendell advised that a window appropriation be made, that suitable fixtures and not makeshifts be obtained and that a layout be arranged before attempting to dress a window; change the displays frequently and have everything spotless.

MAY STRAWN,
Secretary.

NEW YORK.

The March meeting of the New York Branch of the American Pharmaceutical Association was called to order by President McCartney in the lecture hall of the New York College of Pharmacy Building on Monday the 11th, at 8 30 P.M.

Fifty-two members were present.

The minutes of the preceding meeting were read and approved.

The Treasurer's report was received and ordered filed.

Member of the Council: Professor Hostmann stated that he had nothing new to report.

Committee on Education and Legislation: Mr. Lehman reported on the proposed change in the Board of Pharmacy laws, shorter hours bill, the Hicks bill, on the new disclosure of formulas bills and on various suits and court decisions. He also reported on the Federal alcohol tax refund and discussed probability that the Workman's Compensation Insurance

¹ See this issue of the JOURNAL under Committee Reports.

would be taken over by the state. After some discussion it was ordered accepted.

Progress of Pharmacy: Dr. Dickman brought in a lengthy report and abstracts on the following topics:

Manufacture of Potato Starch from Partially Decomposed Potatoes.

Use of Straw for Manufacturing of Gas.

Detection of Foreign Oil in Castor Oil.

Detection of Chlorates in Presence of Hypochlorites.

Detection of Toxicity of Cottonseed Products. Production of Zinc Perhydrates.

Colorimetric Methods of Determining Morphine.

Reaction for Nitrils.

Composition of Thymol Mercurial Acetate.

Considerable discussion followed the reading of this report, which was ordered accepted.

Special Committee: The Committee on By-Laws brought in their report. After considerable discussion some changes in amendments of the by-laws were adopted. The Committee was then discharged with the thanks of the Branch. By motion, regularly moved, seconded and carried, the Secretary was empowered to have printed copies of the constitution together with the new by-laws as well as a list of members of the Branch and to send each member of the Branch a copy of the foregoing. It was now moved, seconded and carried that the President appoint the members of the Committee on Legislation and Education to act as delegates to go to Baltimore and Washington to attend the conference and hearing on the Edmonds Bill.

New Business: The Secretary read a short paper outlining a plan for a "Pharmacy Honor Medal"¹ and suggested that the Branch consider it. It was then moved, seconded and carried to consider the proposition and the following committee was appointed: Hugo H. Schaefer, *Chairman*, Jeannot Hostmann, Caswell A. Mayo, J. L. Mayer and Fred Nitardy.

A paper was read by Prof. Jeannot Hostmann on "Legislating for the Pharmacist." The speaker related many interesting and amusing anecdotes of his experience with legislatures, etc.; considerable discussion followed. A rising vote of thanks was extended to Prof. Jeannot Hostmann.

HUGO H. SCHAEFER,
Secretary.

A PHARMACY HONOR MEDAL.²

We have all heard of the "Perkin Medal" and of the "Nichols Medal." These are medals given annually by the American Chemical Society and by the Society of Chemical Engineering as the highest mark of honor for work done or things accomplished by any individual in the respective branches of science which these two great societies represent. Should not Pharmacy also possess a similar method of showing its appreciation for any signal service performed in the interest of American Pharmacy? With this in view I would suggest the following plan:

That a gold medal or a bronze medallion suitably named be awarded annually to the man or woman who has done most for American Pharmacy during the preceding year or whose efforts during a number of years have culminated to a point during the preceding year where the result of these efforts would be considered as being the most important and advantageous for American Pharmacy.

That the New York Local Branch of the American Pharmaceutical Association take the matter in hand to the extent of devoting one meeting annually to the presentation of this medal.

That in order to make the presentation of this award permanent and perpetual, a fund of \$1000.00 be created either by donations or by means of arranging for a sinking fund, this fund to be invested in gilt edged stocks or bonds, preferably Liberty Bonds and the interest thereof to be used to defray the expense of the award.

That the medal be awarded by a standing committee consisting of all the past presidents of the American Pharmaceutical Association, and in case the number of living past presidents is less than five, the senior past vice-presidents of the American Pharmaceutical Association are to be drawn upon in sufficient number to create a committee of five. That no bar be placed as to the candidate's profession, or kind of work accomplished.

That the medal be presented by the senior past president of the Local Branch mentioned above and taking this meeting in hand.

That the consent and support of the American Pharmaceutical Association be officially obtained to give the presentation of this medal at the Local Branch meeting a national aspect

¹ See immediately following the report of this meeting.

² See action of New York Branch, A. Ph. A., this issue of the JOURNAL.

and as coming from the American Pharmaceutical Association and not merely from the Local Branch.

In conclusion, I would like to say that of course the criticism will be brought up that the presentation of such medal ought to be performed at the annual meeting of the parent organization rather than at a Local Branch meeting. To this I would like to point out that such a presentation could only represent a small part of the day's programme at the Convention, while at a Local Branch an entire evening would be devoted to it.

Since our Branch is the largest and fastest growing branch, since we are located in the largest city as well as for many other reasons, I would suggest that this plan be taken up for consideration by the New York Branch.

HUGO H. SCHAEFER.

PHILADELPHIA.

The regular monthly meeting of the Philadelphia Branch of the American Pharmaceutical Association was held at the Philadelphia College of Pharmacy Wednesday evening, March 19, with the president, Ambrose Hunsberger, in the chair.

Following the regular order of business, reading the minutes, election of new members, etc., Dr. Horatio C. Wood, Jr., read a very interesting paper on "The Elixirs of the National Formulary IV,"¹ in which he pointed out in his own inimitable style the faults of most of the elixirs and the merits of a few. He particularly deplored the lack of uniformity in the doses of the medicinal elixirs and also the uselessness, as he termed it, of many of the formulas given. "It is an insult," said Dr. Wood, "to the intelligent physician to bring into an official book, as simple a formula as the elixir of cascara, which is made by just mixing together the fluidextract and aromatic elixir. An elixir, containing such antagonistic agents as strychnine, bismuth and pepsin, has no place in an official and, presumably, scientific book and the sooner such preparations are deleted, the better it will be for the reputation of the National Formulary."

Professor LaWall opened the discussion on Dr. Wood's paper by quoting the senior Dr. Wood's statement that "it is the duty of framers of pharmacopoeias and other official books to maintain standards for anything which a physician might have occasion to use in his

practice, even if it has no more value than brick dust."

Mr. Beringer then ably answered Dr. Wood's statements and said, in part, that the National Formulary was compiled to answer a specific purpose, to establish a uniformity of standards for the less widely used preparations and drugs. Pharmacists could not be directly charged with the lack of uniformity in the doses of the various medicinal elixirs. Mr. Beringer also pointed out the fact that the comparison of the N. F. IV with the U. S. P. IX was not quite fair, when one had the advantage of eight previous editions and the other only three.

Mr. England stated that the paper was well worthy of being submitted to the Chairman of the Committee of Revision of the N. F., and made such a motion, which was adopted. He also moved that the Branch extend its thanks to Dr. Wood for his constructive criticisms and his very helpful remarks.

F. M. Apple deplored the lack of intelligent propaganda among physicians, to acquaint them with the good formulas of the N. F. and U. S. P., and stated that the parent body was derelict in its duty in not taking the initiative in this matter.

Coinciding with Mr. Apple's views, J. K. Thum then made a motion that a committee be appointed to report on the desirability of commencing propaganda work among physicians. Professor Gershenfeld seconded this motion, which was subsequently adopted and the president was authorized to appoint a committee of three to consider the matter.

The other contribution of the evening was a paper by Prof. H. W. Youngken, on "Wafer Ash Bark as an Adulterant for Euponymus (Wahoo Bark)." Despite the technical character of the paper, Professor Youngken presented it in an understandable and interesting manner and it was afterwards very briskly discussed by Dr. Lowe, Messrs. Beringer, Thum and Griffith. The lantern slides which were shown added much to the value of the paper.

The Secretary then read the report of the Committee on the Endorsement of the Edmonds Bill, and the Branch endorsed this bill or any other measure that would give pharmacy the professional standing to which it is rightfully entitled.

Professor Cook, in presenting the report of the pharmaceutical section of the committee on ways and means of conserving drugs and

¹ See this issue of the JOURNAL.

supplies, suggested that the next meeting of the Branch be dedicated to a thorough consideration of this question, when the committees would be able to present more comprehensive reports. Professor LaWall made such a motion and it was duly seconded and adopted.

The Committee on Nominations then presented their report which was accepted and the nominees were thereafter elected. President Hunsberger relinquished the chair which he had so ably filled during the past year and Mr. McNeary assumed his new duties. The thanks and appreciation of the Branch were extended to the retiring President whose year of administration had been particularly suc-

cessful from every standpoint. The new officers and committees follow: W. W. McNeary, *President*; F. P. Stroup, *First Vice-President*; K. F. Elmann, *Second Vice-President*; Ivor Griffith, *Secretary and Treasurer*; *Committee on Fraternal Relations*—F. M. Apple, *Chairman*, F. E. Stewart, J. K. Thum; *Committee on Practical Pharmacy*—J. C. Peacock, *Chairman*, E. Fullerton Cook, J. R. Minehart; *Committee on Membership*—R. P. Fischelis, *Chairman*; Ambrose Hunsberger, L. Gershenfeld.

The meeting was attended by over 60 persons.

IVOR GRIFFITH,
Secretary.

COUNCIL BUSINESS

A. PH. A. COUNCIL LETTER NO. 12.

PHILADELPHIA, PA., MARCH 16, 1918.
To the Members of the Council.

Motion No. 19 (Election of Members; applications Nos. 69 to 84 inclusive) has received a majority of affirmative votes.

The following report is presented

Report to the Council of the American Pharmaceutical Association:

The special committee of the Council which was appointed at Indianapolis for the purpose of determining the situation at the United States National Museum relative to the housing of the collection of historical pharmacy has conferred with Mr. F. L. Lewton, Curator of Pharmaceutical and Medical Exhibits, and desires to report that adequate provisions exist in the National Museum for the custody and display of specimens illustrative of historical pharmacy.

The National Museum would prefer, wherever possible, that the specimens be offered as outright gifts, but where this is not desirable or feasible, it will gladly accept as loans or deposits, valuable material on the subject of pharmacy, materia medica, and the history of pharmacy. It is customary for loans to be accepted with the understanding that they will be left undisturbed for a year or more, while deposits are usually made for a longer indefinite period. The Museum cannot bind itself to permanently install any exhibit, or to keep any certain assemblage of specimens always exhibited to public view. It can, however, agree to safeguard them and keep them available for examination and study whenever desired. In order to avoid duplica-

tion of material, the Museum would request that all exhibits offered it as gifts, loans or deposits, be first arranged for by correspondence, and the submission of a list or inventory giving an idea of the character and quantity of the material offered.

The committee believes that any property of the Association placed in the National Museum will receive adequate care and therefore recommends to the Council that the collection of historical pharmacy or whatever part of it as may be deemed advisable be placed in the National Museum as a gift or loan from the American Pharmaceutical Association.

Respectfully submitted,

W. W. STOCKBERGER,
H. C. FULLER,
S. L. HILTON.

A motion to approve this report is in order.

The following communication has been received from E. G. Eberle:

"I am in receipt of the following letter from the Smithsonian Institute, United States National Museum, Washington, D. C.:

"In exchange for publications of the United States National Museum, a list of which is enclosed, may I obtain for the Library Vols. 1-5 and Nos. 1-7 of Vol. 6 (1917) of the JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, which are wanted to complete the set? In return I shall be pleased to have sent you such of a selection of the available Museum publications as you may desire.

(Signed) By authority of the Secretary."

"In my opinion we should grant this request and have a full set of the JOURNAL in the Library of the Smithsonian Institute. I therefore move

that the request of the Smithsonian Institute be granted and that a complete set of the JOURNALS as requested be donated and that the Editor be authorized to forward these copies to the Smithsonian Institute.

"The motion is seconded by William B. Day."

Do you favor the above motion? It will be regarded as *Motion No. 20 (Request of Smithsonian Institute for Journals)*.

Motion No. 21 (Election of Members). You are requested to vote on the following applications for membership:

- No. 85. A. P. W. Twombly, 721 Huntington Ave., Boston, Mass., rec. by E. G. Eberle and John G. Godding.
- No. 86. William George Ungerer, 124 W. 19th St., New York, N. Y., rec. by Hugo Kantrowitz and Francis B. Hays.
- No. 87. Judson H. Sencindiver, 48 Seaton Place, N. W., Washington, D. C., rec. by S. L. Hilton and Redmond Mayo.
- No. 88. Samuel L. Antonow, 1360 S. Springfield Ave., Chicago, Ill., rec. by Charles Orr and Wm. B. Day.

J. W. ENGLAND,

415 N. 33rd Street, PHILA., PA. *Secretary.*

RESOLUTIONS ON THE DEATH OF JOSEPH PRICE REMINGTON.

BY COMMITTEE OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

"Tis not in mortals to command success,
But we'll do more, we'll deserve it."

Professor Joseph Price Remington, pharmacist, teacher, executive, writer, Christian gentleman—all these and more departed when on January first, nineteen hundred and eighteen, the leader of our profession went to "mix forever with the elements," and left behind him a memory which shall serve as an inspiration to workers of generations yet to come.

We can not adequately pay tribute to him nor honor him to the extent which is his due. We can only mourn our loss and give voice to a few of the thoughts that arise in us.

The elements of success are often sought for and wondered at after a great man has passed away. In the case of our friend and leader the cause of his success was not obscure. It came to him because he loved his profession and worked for it with every "nerve and bone and sinew." His was an altruistic nature where the good of pharmacy was concerned, and we, his friends and co-workers, representing the American Pharmaceutical Association, desire on behalf of that organization, to express our appreciation of his greatness and our sense of grief at the loss which pharmacy has sustained.

(Signed) CHARLES H. LAWALL, *Chairman*,
H. V. ARNY,
E. G. EBERLE,
S. L. HILTON,
FRANK G. RYAN.

RESOLUTIONS ON THE DEATH OF CHARLES HOLZHÄUER.

BY COMMITTEE OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

WHEREAS, death has removed from the service of this Association, and from the happy companionship of its members, our beloved President, Charles Holzhauser, it seems fitting, as it is to us most desirable, that we should place on record our appreciation of the character and life-work of the deceased, and the deep grief which his loss has brought to us.

The earnest labors for the success of our coming meeting in which President Holzhauser was engaged at the time of his death, was but the culmination of an exceptionally long and faithful membership in the American Pharmaceutical Association. To him, Association

membership was an important part of life, and its meetings among the important events of their respective years. Yet we shared his interest and devotion with many other associations and public interests which enjoyed his support. He was an active and valued member of his state association and of the New York College of Pharmacy, of which he was for many years a Trustee. Not only was he a tower of strength to the particular church of which he was a member, but a generous and helpful friend to many another in its hour of need, and his heart and hand were freely extended to religious work throughout the world. His contribution to the world's work was not that of a mere assenting contributor; he was also active and strong in the framing of policies, and prompt, though ever gentle and kindly, in bestowing criticism and in correcting error and misjudgment. In public affairs, his good citizenship was equally conspicuous. A Republican in politics, he was faithful to his party, yet would no more condone wrongdoing by his associates than by his opponents. He was so good a pharmacist that he acquired a wide and strong influence throughout the city in which he lived, and his influence once secured, was apt to be permanent. The friends of his youth were those of his later years, yet he possessed the happy faculty of attracting also those of a later generation.

In all his work, both private and public, Mr. Holzhauser was simple, calm and unassuming. His strength was the strength of repose, and his influence was thereby the more effective. His judgment of men, motives and measures was prompt, decisive and rarely at fault, and his advice was sought to an extent known only to those who were intimate with him. Such was Charles Holzhauser, the citizen and the man!

It was our great privilege, as his fellow members in this Association, to enjoy the benefits of generous companionship with such a character. His great heart could not be filled by the Association's organization affairs alone. He took into it the personal interests of a very large number of its members. Few exceeded him in the extent of their personal acquaintance with fellow members, to whom he frequently referred in conversation throughout the year. His regard was reciprocated, few being more inquired after when they were missed in attendance at the meeting.

Always modest and retiring, it was Mr. Holzhauser's preference, and his usual custom, to

remain in the background at our conventions, but when his voice was needed to guide counsels, or to prevent mistakes, he was never backward in the performance of his duty. He was generally regarded as a balance wheel in the Association and his opinions were freely sought by those who knew him well. Many a good measure has been furthered and carried because of the advice thus privately secured.

Probably no other public event of his life brought to Mr. Holzhauer such deep satisfaction as his election to the Presidency of our Association. So modest was he that he genuinely doubted whether a majority of the members could prefer him to others whom he

recognized as being eminently qualified for the position. His pride and joy in becoming the recipient of this great honor were deep and full. We, his survivors, can best honor him by a faithful adherence to the principles by which he was guided.

With high appreciation and deep sorrow, we inscribe this tribute to his memory in the Association's records, and with deepest sympathy transmit a copy of the same to his bereaved family.

H. H. RUSBY, *Chairman*,
EDWARD W. RUNYON,
HENRY M. WHELPLEY,
CLARENCE O. BIGELOW,
JOHN G. GODDING.

LETTER TO THE EDITOR, RELATING TO PROF. JOS. P. REMINGTON.

I met Professor Remington first at Hot Springs, Ark., in September 1908, at a meeting of the A. Ph. A., the first one I ever attended. Strange to say perhaps, but the quiet reserve, and strong elements of character of this wonderful man, attracted my attention, and my impression of him was further strengthened and emphasized by the unique and original manner in which the late, still beloved Hallberg introduced him at a meeting of the Diastase Club.

I never felt at any time, that I was privileged to break in upon the quiet and sober reservedness of this good hearted man; yet I was always greatly profited and much delighted, whenever it was my good fortune to be thrown with—in the radius of influence, of his strong and attractive personality.

It was my great joy and personal privilege on several occasions, to be alone in friendly communion with this highly cultured, knightly, courteous gentleman, and splendid entertainer, at which time we exchanged a few stories, an art in which he had no superiors and few peers.

I was walking through the corridor of the Brown Palace Hotel at Denver, Colorado, when the A. Ph. A. met there, when some one hailed me, "Texas where are you going?" and I answered, exercising no definite destination; and Prof. Remington said, come and be with me for a while, to which I most cheerfully responded. While conversing together, Grand Pa Ellis came along, and he called him and introduced him as his preceptor, and had him sit down between us. This was a rich, rare and racy treat to me, in listening to the experiences here unfolded. Grand Pa Ellis addressed Professor Remington as his boy "Joe," and related the great disturbance that Joe experienced over the sale of an eighth of an ounce of bottle of morphine to a customer, who opened the bottle and swallowed the entire contents, causing Joe to beat a hasty retreat out of the store after Grand Pa Ellis to advise him of this awful catastrophe, that had so startled and distressed his young and inexperienced mind. Grand Pa Ellis told of the birthday dinners "of he and Joe" at Longport, sending several postal cards, repeatedly to Texas notifying me of the approach of these dinner happenings. This was truly a Methodist lovefeast, reciting many joyous happenings of the past, which were sanctified with dampened eyes, and never before have I witnessed such an uninterrupted flow of love and affection; such communion of souls, and unification of hearts as seemed to exist between Grand Pa Ellis and his son "Joe," and the tender, sympathetic thoughts engendered in my mind and heart on this occasion, will never be effaced from my memory, for I was captivated and charmed, and fell desperately in love with these two grand and venerable characters.

Professor Remington was great in that he was unselfish, giving so much of self to the benefit and growth of others—so charitable and considerate of all; so modest and unassuming; in social intercourse, so entertaining and instructive; so sweet and kind in disposition; in personality so strong, that he unconsciously attracted attention, and made lasting and abiding impressions upon all with whom he came in contact.

My greatest regret is that I could not have seen more of him and known him better; but with the association that I was privileged to enjoy, I can of a truth say that his life was a most wonderful inspiration to me, and his memory a lasting and blessed benediction.

In sadness and great sympathy do I share the irreparable loss that the going of this noble, good man has occasioned among his own household, loved ones, and legion of friends.

Yours sincerely,
R. H. WALKER.

A TEMPLE OF PHARMACY FORECAST.*

"Professor Wulling's plan of confederating the national drug organizations struck me with much force. It appears at first to be impractical; but when you come to think it over, it seems entirely feasible, if too much is not attempted, and if his idea that the American Pharmaceutical Association shall be the controlling factor can be dispelled.

"When you consider for a moment, you will find that there is reason for the existence of all these organizations. Why did the national wholesale drug trade organize and withdraw from the American Pharmaceutical Association? It was simply because the American Pharmaceutical Association was not meeting the needs of wholesale druggists. Why was the National Association of Retail Druggists formed? Because there were certain commercial necessities that the American Pharmaceutical Association did not meet in the field of retail pharmacy. Then for a long time the pharmaceutical manufacturers were not organized. Each individual concern was a football between conflicting interests. One did not dare to move in the right direction for fear a competitor might take advantage of his stand by offering an unjust concession. So the organization of what was first called the National Association of Manufacturers of Medicinal Products arose out of the problems that confronted all manufacturing pharmacists. The necessities of manufacturing pharmacy were not met by the American Pharmaceutical Association, with which each individual concern was connected; nor by the National Wholesale Druggists' Association, of which each was an active or associate member. There was need for a new organization. This need developed and accentuated itself until in February 1912 this Association was born and named. That very same year it put its name in a report of the Committee on Ways and Means to the House of Representatives recommending the passage of the Sherley amendment, giving the approval of this association as one of its reasons. Of twenty odd bills relating to drug legislation pending before the committee, only two were reported, and these were the two suggested by the counsel of this association at a hearing upon all

Since then our association has put itself into the Congressional Record many times without ever seeking to do so. What is the secret? Simply this: This association has won the confidence of legislative committees and executive bodies for the impartial correctness of the information it has given and the soundness of the judgments it has expressed. It has pursued no other method than that of addressing the judgment and reason of its auditors. This need of pharmacy was never before met by any organization I know of. Thus we have adopted as our code that principle of legal ethics laid down by the American Bar Association, never to undertake to influence a legislative body or executive function in any other way or on any other theory than is followed by a lawyer of true ideals in a court of justice.

But is this not all a digression? I answer no. I relate this history to demonstrate that the American Drug Manufacturers' Association can never merge its identity—its individuality, in any confederation, and I believe the same is true of all the other organizations interested. However, I believe there is room for a confederation of these organizations upon a basis that will not deprive any association of its individuality, but will enable each to hold its meetings in the same place for different purposes.

Professor Wulling's address contained a recommendation that has not been mentioned here—that the confederation, when organized, localize itself, perhaps in Washington, perhaps in New York, in Philadelphia or in Chicago—some place to be decided upon; and there erect what I will

* The above is from the stenographer's notes of Mr. Charles M. Woodruff's verbal report to the American Drug Manufacturers' Association as fraternal delegate from that association to the American Pharmaceutical Association.

take the liberty of calling a Temple of Pharmacy. The professor did not name it. This temple should be the home of pharmacy in all of its branches; where we could all meet within our own gates; where the archives of our respective organizations could be preserved; where large reference libraries could be maintained. It is possible that Professor Lloyd might be willing to have his valuable library housed in a fireproof Temple of Pharmacy.

"Professor Wulling pointed out that his plan meant the initial investment of many hundred thousands of dollars; but he thought the amount could be raised in normal times; and I think so too. His address was the one distinguishing feature of the meeting. It will be as much of an epoch in the history of pharmacy as the gathering of five men at lunch during the Denver meeting of the American Pharmaceutical Association when regret was expressed that it seemed impossible for the several drug interests to get together on matters that interested all. On that occasion I told them how manufacturers dreaded being outvoted by meetings largely attended by representatives of local retail associations, and made the remark: 'Whenever you can devise a body that shall be composed of an equal number of delegates from each of the recognized national associations, and which shall be advisory only, the manufacturers will be with you.' Professor Beal, who was at the table, worked out the idea and presented it to the Association. The results were the National Drug Trade Conference—unique in the history of trade, scientific or professional organizations.

"Think of it! a conference meeting at Washington, deliberating upon a bill proposed by an eminent congressman, and doing so at his instance; amending and modifying it according to the consensus of the judgment of its members; then getting the approval of two of the departments to its amendments, and finally submitting a signed copy of the re-draft to be reintroduced by the same congressman as the bill of the Conference; and securing its passage in the house in the same week it was introduced! The Conference was as deliberative a body as framed the Declaration of Independence, or the Constitution of the United States, and yet a purely advisory body—a body in which we are not merged and yet of which we are members.

Do we not have in the National Drug Trade Conference the embryo, or perhaps the type of, a larger organization, which shall have its Temple of Pharmacy where we may gather annually instead of at the Waldorf-Astoria, and hold our meetings just as independent as we are now holding them, but in an atmosphere distinctly pharmaceutical, and with the feeling that we have the sympathetic interest of all other national pharmaceutical bodies meeting in the same place?"

COMMITTEE REPORTS

REPORT OF THE SPECIAL COMMITTEE ON COMPULSORY HEALTH INSURANCE.

CHICAGO BRANCH OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

The Special Committee on Compulsory Health Insurance which reported partially on February 23, 1917 (*JOUR. A. PH. A.*, 1917, pp. 315-317), herewith submits as its final report the following:

The Committee has considered the subject of health insurance with especial reference to the model bill known as "Standards and Tentative Draft of an Act" proposed by the American Association for Labor Legislation. In connection with this bill the committee has studied the various pamphlets advocating this plan of social insurance which have been issued from time to time by the American Association for Labor Legislation, the reports issued by the Council on Health and Public Instruction of the American Medical Association, and numerous articles appearing in various medical and pharmaceutical journals, and has also sought to obtain information concerning the operation and effects of health insurance systems in force in Germany, Great Britain and other European countries.

As a result of its studies the committee has arrived at the following conclusions:

(1) The standard bill discriminates unjustly between persons employed at manual labor and other wage earners. By the terms of the bill employees at manual labor are to be entitled to benefits regardless of the amount of their annual or monthly earnings, while all other wage earners are to be excluded from these benefits, unless their wage income is \$100 or less per month.

One result of this discrimination would be that an employee at other than manual labor who received even a very small amount in excess of \$100 per month, would be called upon to contribute to benefits for highly skilled mechanics whose annual income might be very much greater than his own.

(2) The standard bill is defective in that it does not make any distinction between illness or disability resulting from the fault or immoral habits of the wage earner or members of his family and that resulting from the nature of the employment, or which ensues without fault or neglect on the part of the insured employee or his family.

In the opinion of the Committee, innocent, industrious and sober employees should not be called upon to bear the expense of the illness or disability, or to contribute to cash benefits for those whose illness or disability is the natural result of their own vicious habits or immoral behavior.

(3) The standard bill is defective in that it does not make adequate provision for the care and treatment of the most necessitous classes of wage earners, namely, those known as casual employees—because their employment is occasional or irregular—and those who are described as self-employed persons—or those who gain a livelihood by the conduct of some small independent business of their own.

In the case of the casual employee the bill gives to the Social Insurance Commission the power to altogether exempt them from benefits. In the case of the self-employed individual it provides that he may insure himself voluntarily in the insurance funds, provided he can pass a satisfactory medical examination and pay the premiums. This means nothing to the self employed person, since he already possesses the privilege of insuring himself, provided he is able to pass a satisfactory examination and pay the premium.

(4) The bill is objectionable in that it places no limit whatsoever upon the amount of money that may be collected and expended for the purposes of health insurance. The proportions of the several contributions by employers, employees and the state are fixed, but not the amount which may be collected and expended so long as the proportions specified are adhered to.

In the opinion of the Committee it would be bad public policy to erect within the state a political instrumentality for the collection and expenditure of money—amounting to millions of dollars annually—without any other limitation upon the total sums to be collected and expended than the discretion of the individuals selected to administer the law.

(5) The standard bill is objectionable in that it empowers the Social Insurance Commission to establish and maintain as many branch offices, and to appoint as many officers, assistants and employees as it deems necessary, without any limitation upon this appointing power.

In the opinion of the Committee, it would be contrary to a sound public policy to confer upon any body created by legislative action the unrestricted right to establish branch offices and to appoint as many assistants and other employees as it might deem necessary.

(6) The bill is objectionable in that it does not provide any outside instrumentality to supervise the handling and care of the vast sums of money which would be collected and disbursed in the administration of the act.

In the opinion of the Committee it would be contrary to sound public policy to relieve the various boards and committees provided for in the bill from the supervision and control of the auditing and other supervisory agencies which the state imposes upon its various other fiscal agents who are charged with the collection and disbursement of public monies.

(7) The standard bill is objectionable in that some of its provisions are so loosely drafted that it is impossible to intelligently interpret them or to determine the manner in which they are to be applied. As an example we cite Section 56, which reads as follows:

"Medical Advisory Board. The State Medical Societies shall choose a Medical Advisory Board which shall be consulted on medical matters."

It will be observed that it is impossible to determine from this language either the number of members on the board or the length of time for which they are to hold office. Neither is there any specification as to the manner in which the board is to assemble, conduct its deliberations or deliver its decisions. It is equally uncertain whether the medical societies representing the various sectarian schools of medicine are each to elect an equal number of members to the medical advisory board, or whether their representation thereon is to be proportional to the number of members constituting the medical society.

Other portions of the bill are equally obscure and uncertain.

(8) The bill is objectionable in that it makes no provision whatsoever for the manner in which pharmaceutical, medical and surgical supplies are to be obtained.

From a study of the history of the evolution of the bill, and from statements of some of those who favor its enactment by the several states, there is reason to believe that it is contemplated that these supplies will be furnished to insured persons and their families through dispensaries established and maintained out of the insurance funds.

Since it is estimated that compulsory health insurance would provide for the medical requirements of 75 to 80 percent of the working population, there would naturally be a corresponding contraction in the demand for such supplies through the usual retail drug store. Believing as we do that the retail drug store is both a public necessity and a public convenience, we are of the opinion that such a discrimination against the retail druggist is unjust, especially when we consider that the proprietor as an employer would be required to insure his employees under the fund, and as a tax-payer would be compelled to contribute to the proportion of the expense which is to be borne by the state.

In this connection the committee has also made some effort to learn the effect of compulsory insurance upon the drug business in countries where such systems are in force, and where by means of positive provisions in the law efforts have been made to care for the interests of drug dealers.

As a result we have found that such dealers are very generally dissatisfied with the operation of the law. When they receive a portion of the insurance business, they are compelled to render services for which they receive but very little compensation, while those who receive little or none of the insurance practice have suffered a great contraction in the volume of their former business.

(9) The standard bill is objectionable in that it will tend to discourage self-help on the part of employees through voluntary insurance in trade unions and fraternal societies or in societies maintained jointly by the contributions of employees and employers.

While certain sections of the bill seem to authorize the insurance of wage earners in voluntary societies, it is apparent on closer study that the continuance of such societies is to be prevented or at least discouraged. The reason for this conclusion is found in the provision that an employer who contributes to such a society within his own establishment must, nevertheless, pay to the Social Insurance Commission the same amount as he would be required to pay if his employees were not thus voluntarily insured. There is also a further provision which permits the closing up of such societies if, in the opinion of the Social Insurance Commission, their continuance will endanger the success of the state insurance fund in any district.

It is the opinion of the Committee that the state should foster attempts at self-help on the part of wage earners rather than the contrary, and also that if a state subsidized system of insurance is unable to successfully compete with voluntary associations, then there is no reason why the state should attempt such functions.

In addition to the foregoing objections, which refer particularly to the provisions of the standard bill, the committee cites the following objections to any system of state subsidized compulsory health insurance:

(10) The claims of the advocates of compulsory health insurance that its establishment will improve the general health conditions of the community and diminish the mortality and morbidity rates, are disproved by statistics collected from countries where such systems of insurance are in force.

According to statistics collected by Mr. Frederick L. Hoffman, statistician for the Prudential Life Insurance Company:

"From the introduction of social insurance in the city of Berlin to the present time, the mortality rate at ages over ten years has practically remained unchanged. * * * Considered by quinquennial periods, there has practically been no perceptible change in the rate during the entire period since social insurance has been in operation, including insurance against invalidity. Evidence of this nature can neither be contradicted nor gainsaid.

"There has been a greater reduction in the tuberculosis death rate in this country than in Germany, regardless of the enormous governmental machinery serving social insurance purposes."

According to Mr. Hoffman the decrease in the tuberculosis death rate in Prussia was 51 percent in thirteen years, while in the same period the decrease in the tuberculosis death rate in Massachusetts was 57 percent.

Mr. Hoffman also shows that there has been a greater decrease in the mortality rates in New York City than in Berlin from tuberculosis, typhoid fever, diphtheria, and croup.

From the report of a commission especially appointed to consider the results of the insurance act in Great Britain the following statements are abstracted:

"The tuberculosis scheme cannot be regarded as a success. In all probability much better results would be obtained were the existing system of over-lapping control brought to an end and the whole responsibility vested in one public health authority. * * * The results of the act as regards sanatorium benefit are looked on as disappointing. The problem was largely miscalculated and the results fall far short of the expectations raised. * * * Most of the evidence was in favor of handing the whole treatment of tuberculosis to the public health authorities."

Much additional evidence might be cited tending to the same effect, namely, that there has been a greater improvement in morbidity and mortality rates in the United States than in the various European countries where compulsory insurance systems are in force.

(11) Compulsory health insurance in the United States would operate to the detriment of the professional independence and progress of the general medical profession.

It might be to the financial advantage of those securing employment under the act, either as panel physicians or as salaried officials, but this could only be at the corresponding disadvantage of physicians who did not obtain such positions.

In order that the whole body of physicians might profit by the enactment of such a law, it would be necessary either that the number of patients per physician should be increased, or if the sickness rate remain the same, that the rate of pay per patient should be increased.

To argue that the amount of sickness would be increased is to argue against the enactment of such a law. To argue that the average rate of pay per patient would be increased is to argue in opposition to experience. Wholesale business implies wholesale rates, and it would be foolish to assume that those in charge of the insurance funds would be willing to pay the same rates for the treatment of 500 families as would be expected in private practice, or that in arranging for medical services they would not make use of the economic force of competition among physicians.

(12) Compulsory health insurance would be detrimental to the medical profession because of the political competition for positions which would inevitably result. It is utterly foolish to assume that where positions differed in desirability there would not be political scrambles to obtain the more desirable ones; or that such competition could be carried on without political organization and all of the turmoil that political contests induce. To win, the contestants would have to be affiliated with the winning side, and that means "practical politics," and all that such affiliation implies.

(13) A system of compulsory health insurance would be inimical to the progress and improvement of the existing regularly constituted public health agencies. The new system would have behind it a powerful organization consisting of a multitude of officials and employees, and able to exercise tremendous pressure upon legislative bodies and the public administration of the state. With such an organization, constantly calling upon the legislature for new appropriations, the other public health agencies of the state would have to compete, with results that could only be disastrous to the weaker party.

(14) Compulsory health insurance could not fail to weaken the sense of personal responsibility and to lessen the efforts at thrift and providence of the wage earner. It is contrary to human nature to expect that those who feel that they will be provided for by the government will not let down in their efforts to make provision for themselves, with a consequent reduction in the moral stamina of the individuals concerned. Such a reduction in moral stamina is one of the acknowledged results of compulsory insurance in European countries.

(15) Compulsory health insurance would inevitably result in the production of a large number of discards among industrial workers, because it would make necessary the discarding of employees who were bad risks from the insurance standpoint.

One student of the subject has estimated that the number of such discards in the United States would amount to four millions or more, who would thus automatically pass from the list of those regularly employed into the classes of the unemployed, casually employed, or self-employed with a corresponding increased strain upon public charities.

(16) Compulsory health insurance would not only increase the normal rate of state taxation enormously,—perhaps two or three hundred percent—but would add very greatly to the cost of products manufactured by the insured industries.

It requires only an elementary knowledge of political economy to realize that burdens placed upon industries are eventually transferred to the ultimate consumer. Under health insurance both employer and employee could obtain partial recompense for their added expenses, the first by adding to the selling price of his product, and the second through medical benefits. But the ultimate consumer, who is neither employer nor employee, would have no such means of recoupment and would have to bear the burden alone.

(17) One effect of compulsory health insurance in European countries has been to increase malingering on the part of employees, that is, either the pretense of illness or the exaggeration of symptoms in order to secure benefits.

Statistics show this to be true beyond question, and that in Germany, for example, not only has the number of real or pretended cases of sickness very largely increased but also that the period of real or pretended disability has been very greatly extended under health insurance. Numerous competent observers have asserted these facts, and several have estimated "the number of impostors and those who intentionally exaggerate their symptoms as constituting not less than 50 percent of all cases."

Similar results have been noted in Great Britain and in other countries where these laws are in force. There is no good reason whatsoever to believe that the same result would not follow the introduction of the system into this country.

In conclusion. The Committee report that, in their opinion, a system of state subsidized compulsory health insurance is contrary to the fundamental ideals of the functions of government as hitherto interpreted in America, and of a self-reliant, progressive American citizenship. The Committee therefore recommends that the Chicago Branch of the American Pharmaceutical Association refuse to endorse the standard bill proposed by the American Association for Labor Legislation and, in case such legislation is proposed in the state of Illinois, that the members of this Branch, individually and collectively, take an active part in seeing that the general public, and especially tax-payers, wage earners, and members of the medical profession and of the drug trade shall be fully informed of the dangers of state subsidized compulsory health insurance and of the results that have followed the establishment of such insurance in other countries.

Respectfully submitted,

J. H. BEAL, *Chairman,*

BERNARD FANTUS,

J. H. WELLS,

Committee.

REPORT OF THE COMMITTEE ON DRAFTING A MODEL FOR A MODERN PHARMACY LAW, AMERICAN PHARMACEUTICAL ASSOCIATION.*

Your Committee at this time presents what it would designate to be a Preliminary Draft. In taking up its task the Committee has been mindful of the work of the Voluntary Conference which was created under the auspices of the Section on Education and Legislation and which proposed a number of new features, very generally meeting with the approval of the State boards and State associations represented therein. It is our understanding that proper further consideration shall be given to the wishes of the Voluntary Conference in the final completion of our work. We would make plain that none of the features contained in the Preliminary Draft have met with final approval, and that as to some there is at present a difference of opinion in the Committee. We believe it possible only to arrive at the best conclusions at a conference where the Committee members can discuss every feature and then decide upon its desirability and such conference will be our aim.

In submitting this preliminary and unfinished draft we have the thought to profit from discussion and criticism which may take place at this meeting and which we earnestly solicit.

* A general discussion followed the presentation of each Section discussed, and at the conclusion of the discussion a vote of thanks was tendered the Committee for their painstaking work, and the body recommended the continuance of the Committee. Chairman Freericks expressed the opinion that the final report on the draft would be presented at the next meeting. The analysis and draft are printed so that all members may study the provisions.

Likewise, we hope to profit from publication and discussion in the Pharmaceutical Press, and if possible in the Medical Press. In order that there may be no misunderstanding as to the scope of our work, we would explain that we mean it to be purely a model. It is not within our sphere to present a draft which can be certainly enacted to-day or to-morrow, in the different States, but rather to present one which we know with due regard for the public welfare should be enacted. We realize that conditions in different States may not be opportune for securing such pharmaceutical legislation as should now exist, but we believe that with a proper model there can be a gradual, if not an immediate, accomplishment. Therefore, we would say to the critic who agrees that our aim is correct, but not possible of practical attainment, that we are concerned only in having the correct aim, and that we must leave to the future which inevitably works toward correctness and improvement, the desired practical attainment.

In order to serve a more ready appreciation of the scope of this Preliminary Draft, we offer the following abstract of its more important features

First, It provides that at least a majority of pharmacy board members shall be graduates in pharmacy.

Second, That the pharmacy board shall in conjunction with a drug commissioner to be appointed by it, be charged with the enforcement of all laws pertaining to pharmacy, inclusive of the compounding, distribution, purity and sale of drugs.

Third, That all persons engaged in compounding, selling or distributing potent drugs and poisons at retail, shall prove qualification, and shall be registered by the board of pharmacy.

Fourth, A more definite status of the rights of the assistant pharmacist is sought; the physician and veterinarian, who would compound and dispense his own medicines must prove his qualification to practice pharmacy, and to that extent is to be under the supervision of the board of pharmacy; the so-called drug dealer is to exist only where reasonable public needs require his existence, and he is to show at least some qualification. The provisions which concern the physician and the drug dealer, that is, to show qualification, are not to be applicable to those physicians and drug dealers who at present may be qualified because of practical experience, and such practical experience shall entitle them to registration, in order to meet the objection which otherwise would be insurmountable.

Fifth, It does not seek to interfere with the present practice of the physician, dentist or veterinarian to supply emergency drug needs when personally administered in an emergency.

Sixth, Preliminary educational requirements and the so-called prerequisites are provided for. Academic degrees are required from those who in the future would occupy the chairs of pharmacy, chemistry and materia medica, in colleges of pharmacy. Apprentices are to be registered when they enter their apprenticeship. Reciprocal registration is provided for. Requirements for recognition as colleges or schools of pharmacy are sought. Membership in an association of state boards of pharmacy is sought to be put upon a legal basis, and the necessary support for maintaining such an association is provided for.

Seventh, Suspension and revocation of certificates for cause inclusive of a proper right of appeal from the decision of the board.

Eighth, Definitions for poisons and for potent drugs under which it will be the duty of the board of pharmacy from time to time, to enumerate all poisons and all potent drugs, publishing lists of the same, with provision for a proposed appeal from the decision of the board.

Ninth, All poisons and potent drugs as enumerated either in the Act or in publications of the board are to be labeled, showing poison or potent drug content, but when dispensed by or on the order of a physician, dentist or veterinarian, to either show such content, or to be subject to ready identification by number or mark corresponding with a number or mark on a written record of the content.

Tenth, Drugs and medicines compounded and manufactured under the laws of other States not requiring a publication of poison or potent drug content, when offered at retail, to be under the supervision of the board of pharmacy, whose duty it shall be to determine poison and potent drug content, and who shall then publish lists of such articles, and aside from the label requirement all of the other provisions governing the sale and distribution of poisons and potent drugs, shall then be applicable after such publication.

Eleventh, The Act is intended to include the N. A. R. D. Model for an Anti-narcotic Law.

Twelfth, The Act is intended to include a Pure Drug Law, based upon the provisions of the Federal Act.

Thirteenth, Throughout it has been the aim, aside from matters pertaining to drug adulteration, to seek control primarily over all persons who at retail would sell and distribute poisons and potent drugs. It will be observed that the classification of drugs which are to be considered of a potent character is sufficiently broad, to include all which in the hands of unqualified persons may endanger health and life. The primary thought is, to protect the public whose welfare should be our first aim. A complete copy of the preliminary and unfinished draft is attached hereto.

Respectfully submitted,

FRANK H. FREERICKS, *Chairman*,
WILLIAM C. ANDERSON,
H. V. ARNY,
JAMES H. BEAL,
CHAS. H. HUHNS.

PRELIMINARY PARTIAL DRAFT OF AMERICAN PHARMACEUTICAL ASSOCIATION MODEL PHARMACY LAW.

AN ACT TO REGULATE THE PRACTICE OF PHARMACY, ETC.

SECTION 1: Definition

SECTION 2: There shall exist and be maintained within the State a State Board of Pharmacy with duties and powers as hereinafter defined and provided. The State Board of Pharmacy shall consist of five (5) members, and the now existing State Board of Pharmacy heretofore appointed, shall continue in office and act as the State Board of Pharmacy with all the duties and powers as herein provided until the terms of its present members, respectively, expire, the vacancies as they annually occur to be filled in keeping with the requirements of this Act. Hereafter in making appointments to the State Board of Pharmacy the appointees shall have been Registered Pharmacists under this or some former law of the State, for a period of at least ten (10) years, and they at the time of their appointment shall be engaged in conducting a retail pharmacy. At least three (3) members of the State Board of Pharmacy shall be graduates of a, by this State, recognized college or school of pharmacy, and if the now existing State Board of Pharmacy is not so constituted the first occurring vacancies of the State Board shall be filled with appointees meeting such qualification, except in the case of re-appointment of present members, and such qualification for at least three (3) members of the Board shall thereafter be maintained. Members of the Board of Pharmacy to be appointed under this Act, shall be appointed by the Governor and shall serve for a term of five (5) years, or until their successors are appointed, and have duly qualified. Vacancies occurring in the Board of Pharmacy shall be filled for a term shall be filled for the unexpired term only. The members of the Board shall be paid ten (\$10.00) dollars *per diem*, and their necessary expenses while actually engaged in the performance of the duties of the Board. Annually, the State Pharmaceutical Association may from among its membership nominate five (5) candidates for the next occurring vacancy on the Board of Pharmacy, who shall meet the requirements as herein provided, and, from among the nominees when regularly submitted and certified by the president and secretary of said State Association, or from others having the necessary qualifications, the Governor shall make his appointment for vacancies occurring in the Board of Pharmacy. Appointees to the Board of Pharmacy shall within ten (10) days after their appointment, take and subscribe an oath or affirmation before a properly qualified officer, that they will faithfully and impartially perform the duties of their office, which oath or affirmation shall be filed with the Secretary of State. The State Board of Pharmacy shall have a president, vice-president, secretary and treasurer, all of whom shall be elected annually, from among their number, except the secretary. The officers of the existing Board shall continue to so act until their terms, for which they have been elected, expire.

SECTION 3: Duties and compensation of Secretary and Treasurer.

SECTION 4: It shall be the duty of the State Board of Pharmacy through officials and employees appointed by it, or under its supervision for that purpose, to enforce all laws of the State now or hereafter enacted, which pertain to the practice of pharmacy, manufacture, production, sale or distribution of drugs, chemicals and poisons, and to their standard of purity.

SECTION 5: There is hereby created the office of a State Drug Commissioner, who under the jurisdiction and supervision of the State Board of Pharmacy, on his own authority as such, is directly charged with the enforcement of all laws as provided in Section 3, subject to the control of the Board. The State Drug Commissioner shall be appointed by the State Board of Pharmacy for a term of five (5) years at a salary of \$—— per annum. The State Drug Commissioner immediately prior to his appointment shall have been engaged in the practice of pharmacy for at least ten (10) years, he shall be a graduate of a college or school of pharmacy, recognized under the laws of this State, and shall be chosen with due regard for his knowledge of chemistry and of his executive ability. Vacancies in the office of the State Drug Commissioner shall be filled by the Board for the unexpired term. The State Drug Commissioner shall employ all necessary chemists, agents and clerical help, for the proper conduct of his office, as may be from time to time determined by the State Board of Pharmacy, and all of his appointments shall be passed upon and approved or disapproved by the State Board of Pharmacy at its next regular session after the appointments are made. The State Drug Commissioner shall report to the State Board of Pharmacy at all its regular sessions.

SECTION 6: The State Board of Pharmacy shall meet at least four (4) times a year in the City of ———, or at such other place within the State as it may designate at any regular session, as an Examining Board, and for the purpose of supervising the office of the State Drug Commissioner. As an Examining Board it shall examine all persons in the art and science of Pharmacy and its allied branches, who meet the necessary qualifications as herein provided and who make application for registration as Pharmacist, Assistant Pharmacist, Medical or Veterinary Dispensers and Drug Dealers.

SECTION 7: The compounding, manufacture, sale and distribution of drugs and medicines at retail when of potent or poisonous character as defined in this Act, shall be limited exclusively to persons who are registered for that purpose under the provisions of this Act, provided that all persons heretofore and now registered within this State as Pharmacists or Assistant Pharmacists, shall have all the rights which are granted to Pharmacists and Assistant Pharmacists under this Act when complying with the requirements thereof as hereinafter set out; and, provided further, that nothing contained in the Act shall be construed to prevent the personal administration of drugs and medicines carried or kept for emergencies, by licensed dentists, physicians and veterinarians, in order to supply the immediate needs of their patients while in their presence. For the purposes of this Act there shall be and are hereby made provisions for the registration of Pharmacists, Assistant Pharmacists, Medical and Veterinary Dispensers and Drug Dealers, each having the rights hereinafter provided, and being subject to the limitations and restrictions as respectively made.

(a) A Pharmacist shall have the right to conduct a pharmacy for the compounding of medicines upon physicians' prescriptions, and for the manufacture, sale and distribution of drugs, medicines and poisons.

(b) Assistant Pharmacists shall have the right to do all things that may be done by a Pharmacist, in a pharmacy or place of business, conducted under the supervision of a pharmacist. Supervision as herein required shall not permit the absence of a Pharmacist for more than one (1) day within each separate week.

(c) Medical or Veterinary Dispensers, who must also be by this State licensed physicians or veterinarians, shall have the right only to compound and dispense medicines which they prescribe for persons or animals under their medical treatment, and such compounding and dispensing shall be strictly incident to the practice of medicine and veterinary medicine.

(d) Drug Dealers when conducting fixed places of business at least ——— miles distant from a pharmacy, shall have the right to distribute and sell potent drugs and medicines, and poisons as compounded and prepared under the supervision of pharmacists registered in this or other States when properly labeled under the name of a Registered Pharmacist, known wholesale dealer or manufacturer of drugs and chemicals. A drug dealer having established a fixed place of business under the law shall be privileged to continue the same notwithstanding pharmacies are subsequently established within the ——— mile zone, but when disposing of his place of business shall be subject to the restrictions herein provided in establishing a new place of business.

SECTION 8: Applicants for registration as Pharmacists, Assistant Pharmacists, Medical or Veterinary Dispensers, or Drug Dealers, shall before being admitted to examination meet the following preliminary requirements, proof of which must be first filed with the secretary of the Board under rules and regulations adopted by it:

(a) Applicants for registration as Pharmacists, shall be not less than twenty-one (21) years of age, and shall be graduates of a recognized college or school of pharmacy; they shall have at least four (4) years of practical experience in a drug store or pharmacy where physicians' prescriptions are compounded, provided that not more than two (2) years of credit in meeting such requirement may be given for attendance of at least two (2) full school years at a recognized college or school of pharmacy; they shall have to give proof of a preliminary general education equal to eight units as given in a high school of the State.

(b) Applicants for registration as Assistant Pharmacists shall be not less than eighteen (18) years of age, and shall have at least two (2) years of practical experience in a drug store or pharmacy, where physicians' prescriptions are compounded, provided, that a credit of one (1) year in meeting such requirements may be given for attendance of not less than one (1) full school year at a recognized college or school of pharmacy; they shall meet the same general educational requirements as provided for pharmacists.

(c) Applicants for registration as Medical or Veterinary Dispensers shall give proof that they are registered under the laws of the State as Physicians or as Veterinarians.

(d) Applicants for registration as Drug Dealers shall be not less than twenty-one (21) years of age, and shall give proof of having attained at least a common school education entitling them to entrance of a high school in the State.

SECTION 9: Applicants for registration as Pharmacists and as Assistant Pharmacists shall, to prove their respective requisite knowledge, be examined to a proper varying degree in the subjects of chemistry, botany, materia medica, toxicology, and the theory and practice of pharmacy. Applicants for registration as Medical or Veterinary Dispensers shall be examined in the theory and practice of pharmacy, the scope of such examination to be like that which applicants for registration as Assistant Pharmacists are required to pass. Applicants for registration as Drug Dealers shall be suitably examined in physics and toxicology. Provided, however, that all registered physicians and veterinarians of this State, who, when this Act takes effect, have been accustomed to compound and dispense the medicines which they prescribe for their patients, may on application to the Board of Pharmacy within ninety (90) days from that date, upon affidavit, setting out such fact, become registered without examination as such Medical or Veterinary Dispensers and Drug Dealers, who prior to, and at the time that this Act takes effect, have been engaged as such within the State, may within ninety (90) days from that date become registered as such without examination, upon application to the Board of Pharmacy, giving satisfactory proof.

SECTION 10: Persons who hereafter desire to engage in pharmacy, with a view of becoming registered as Assistant Pharmacist and as Pharmacist, shall, upon entering employment in a pharmacy, register as apprentices with the State Board of Pharmacy, and for all such persons the requisite practical experience shall be determined from the date of registration. A fee of fifty cents (50 c.) shall accompany an application for registration as apprentice. A person who before or after this Act takes effect may have served part of his apprenticeship in some other State not requiring such registration shall give proof of such service satisfactory to the Board. Persons who for more than six (6) months immediately

prior to the time when this Act becomes effective, have been employed in a retail pharmacy, with a view of becoming registered as an Assistant Pharmacist or as a Pharmacist, shall for the purpose of registration as such, be by the Board required to meet the provisions of the law as they existed immediately prior to this Act becoming effective.

SECTION 11: It shall be unlawful for any person to impersonate an applicant before the State Board of Pharmacy applying for registration under the provisions of this Act. Any person violating this Section shall be guilty of a misdemeanor, and, upon conviction, shall, pay a fine of not more than one hundred (\$100.00) dollars, or be imprisoned for not more than six (6) months, or either, or both, in the discretion of the court.

SECTION 12: Persons desiring to enter a college or school of pharmacy shall give proof of the required general education prior to admittance thereto. The necessary proof of an entrance examination shall consist either of certificates issued by the proper school authorities, or in successfully passing an examination before an Entrance Examiner, appointed by the Board for that purpose, at suitable compensation to be allowed by the Board. The Entrance Examiner, under the authority of the Board, shall issue to such persons applying therefore a certificate of preliminary education.

SECTION 13: The State Board of Pharmacy shall recognize as such, Colleges and Schools of Pharmacy which require for graduation a course of studies covering a period of not less than fifty (50) weeks of actual instructions, occupying two (2) school years, with a vacation period of at least two (2) months, between such two (2) school years. Each school year shall cover at least two hundred and fifty (250) hours of class-room instructions and three hundred and fifty (350) hours of individual laboratory practice, including at least the work outlined by the Pharmaceutical Syllabus of 1913. It shall further be required for recognition that at least the professors of pharmacy, chemistry, and materia medica, teaching in such school or colleges of pharmacy, shall hold the degree of B.A. or B.Sc., provided, that this requirement shall not apply to professors of pharmacy, chemistry, or materia medica, who are teaching as such in colleges or schools of pharmacy when this Act becomes effective.

SECTION 14: The State Board of Pharmacy may in its discretion grant certificates of registration as Pharmacist or as Assistant Pharmacist, to persons who furnish proof that they have been registered as such by examination in some other State, and that they are of good moral character, provided, that such other State in its examinations requires the same general degree of fitness as is required by examination in this State, and that the applicant qualifies in all other respects as is required for registration by examination in this State, excepting that persons who have become registered by examination in other States, prior to the time that this Act takes effect, and who have continuously thereafter been engaged in pharmacy, shall be required to meet only the requirements which existed in this State at the time when they became registered in such other State, and provided further, that such other State or States in like manner grant reciprocal registration to Pharmacists and Assistant Pharmacists of this State. Applicants for reciprocal registration in this State shall defray all necessary expense for making an investigation of their character, general reputation and pharmaceutical standing, in the State where they have resided, such expense not to exceed the sum of ten (\$10.00) dollars.

SECTION 15: The State Board of Pharmacy, in order to be informed and to determine the status of Boards of Pharmacy of other States desiring reciprocal registration, and in order also to be advised regarding the progress of pharmacy throughout the country, shall annually select one of its members to meet at the expense of the Board, to be allowed out of its appropriation, with like representatives from other State Boards of Pharmacy. At such meetings, when arranged, there shall be discussed the degree of fitness for registration which is required by the several State Boards of Pharmacy. Such representatives of the several State Boards of Pharmacy may adopt rules and regulations, which shall guide the several Boards in the matter of reciprocal registration, but abidance with such rules and regulations as may be proposed at annual conferences shall be optional and at the discretion of the State Board of Pharmacy. The State Board of Pharmacy through its representatives may with like representatives from other State Boards of Pharmacy join in

creating and maintaining an association of representatives of the several State Boards of Pharmacy, to be engaged in the general advancement of pharmacy and the keeping of records pertaining to reciprocal registration of pharmacists, and at its discretion the Board may give to such Association information which it possesses relating to such aims and objects. The State Board of Pharmacy at an expense not to exceed one hundred (\$100.00) dollars per annum may subscribe for and secure the service of an association engaged in the compilation of pharmaceutical information, knowledge and progress, specially adapted to secure efficiency in the work of the Board.

SECTION 16: Applicants for examination as Pharmacists shall pay an examination fee of five (\$5.00) dollars; applicants for examination as Assistant Pharmacists, Medical or Veterinary Dispensers, and as Drug Dealers, shall pay an examination fee of three (\$3.00) dollars. Certificates of registration shall be issued to Pharmacists on payment of a fee of ten (\$10.00) dollars, and to Assistant Pharmacists, Medical or Veterinary Dispensers, or Drug Dealers, on payment of a fee of five (\$5.00) dollars. Certificates of Preliminary Education shall be issued at a fee of three (\$3.00) dollars. Applicants for reciprocal registration as Pharmacists, in addition to the fee covering costs of investigation, shall pay a fee of \$—— and Assistant Pharmacists a fee of \$——. All fees shall be paid to the State Board of Pharmacy, and by it covered into the State Treasury.

SECTION 17. The registration of any Pharmacist, Assistant Pharmacist, Medical or Veterinary Dispenser, or Drug Dealer, may be suspended or revoked by the Board of Pharmacy, when the registration is proved to the Board, to have been obtained by fraudulent means, or when the registrant has been convicted of a felony or is found by the Board to be guilty of gross immorality, or to be addicted to the liquor or drug habit to such a degree as to render him unfit to compound, sell or distribute drugs and medicines. Suspension or revocation of a certificate shall be only after due notice and hearing, and for the purposes of such hearing the Board or any member thereof is authorized to examine witnesses under oath and to take oaths or affirmations, and to reduce the testimony given in any such case to writing. Within thirty (30) days after the suspension or revocation of a certificate of registration, the registrant may take an appeal to any court of record of the State, of competent jurisdiction, and pending such appeal the decision of the Board shall be suspended until the court renders judgment which shall be final in the case, and if the decision of the Board is not sustained, the registrant shall be re-instated.

SECTION 18: There shall be kept in every pharmacy and in every medical or veterinary dispensary a copy of the latest revision of the U. S. Pharmacopoeia and the latest revision of the National Formulary, and if Homeopathic remedies are compounded and dispensed, a copy of the latest revision of the American Homeopathic Pharmacopoeia or Homeopathic Pharmacopoeia of the U. S., which books must be open to the inspection of the Board of Pharmacy, the Drug Commissioner and their properly authorized agents or employees. Any person violating this Section shall, upon conviction, be fined the sum of ten (\$10.00) dollars and the costs of prosecution.

SECTION 19: All certificates as Pharmacists and Assistant Pharmacists, Medical or Veterinary Dispensers, and Drug Dealers, shall at all times be conspicuously displayed in the place of business or dispensary where the registrant is engaged as such. Any registrant violating this Section shall, upon conviction, be fined to pay the sum of ten (\$10.00) dollars and the costs of prosecution.

SECTION 20: Registration of place annually.

SECTION 21: The Board of Pharmacy shall make, from time to time, uniform rules and regulations, which are to govern it and the Drug Commissioner and all employees in the enforcement of this Act. It shall prescribe, publish and furnish all application forms for registration, which are required under this Act.

SECTION 22: It shall be unlawful for any person who is not a registered Pharmacist, registered Assistant Pharmacist, registered Medical or Veterinary Dispenser, or Drug Dealer, or who is not under the direct and immediate supervision of either of such registrants operating within their lawful spheres, to compound, manufacture, sell or distribute at retail any potent drugs or poison as hereinafter defined, excepting only, that this provision

shall not apply to the sale of drugs and poisons when intended for agricultural, technical and industrial use, and shall not apply to the personal administration of drugs and medicines by dentists, physicians and veterinarians in keeping with Section 7 of this Act. It shall be unlawful for Medical or Veterinary Dispensers to compound, sell and distribute potent drugs or poisons, except for use by bona fide patients, who are under their medical treatment. It shall be unlawful for any Drug Dealer to compound or manufacture Potent Drugs, poisons or preparations containing the same, and it shall be unlawful for such Drug Dealer to sell or distribute potent drugs and poisons, except in original packages as prepared by and under the supervision of a registered Pharmacist of this or some other State, properly labeled to meet all requirements of the law, and bearing the name of the original distributor or manufacturer. Any person violating the provisions of this Section shall be guilty of a misdemeanor, and upon conviction thereof shall be sentenced to pay a fine of not less than fifty (\$50.00) dollars, nor more than five hundred (\$500.00) dollars, or to imprisonment for not more than one (1) year, either, or both, in the discretion of the court.

SECTION 23: (A) The term poison shall include the compounds and salts of antimony, arsenic, _____ etc., and shall include all compounds, combinations, mixtures and preparations of the same, which contain more than one (1) adult medicinal dose of said substances in each one-half fluid ounce, if liquid, and one-half avoirdupois ounce if solid, of such compounds, combinations, mixtures and preparations, or when in the form of capsule, pill, tablet, powder or other like sub-divisions there is contained more than one adult medicinal dose in two or less of such capsules, pills, tablets, powders, or other like sub-divisions. The term poison shall further include all substances of which an adult medicinal dose when in original form is less than two grains if solid, and less than two minims if liquid, and the compounds, combinations, mixtures and preparations thereof, when more than one adult medicinal dose is contained in one-half fluid ounce if liquid, and one-half avoirdupois ounce, if solid, or when in capsule, pill or tablet, powder or like sub-division more than one such adult dose is contained in two or less of such sub-divisions.

(B) The term potent drug shall include all poisons as defined in sub-section (A) hereof, and all preparations containing more than five percent (5%) of alcohol by volume when intended for medicinal use, and shall further include all substances, the adult medicinal dose of which is less than sixty (60) grains, if solid, or sixty (60) minims, if liquid, and all compounds, combinations, mixtures, and preparations thereof, which contain more than an adult medicinal dose in each fluid ounce, if liquid, and each avoirdupois ounce, if solid, or when in capsule, pill, tablet, powder or other like sub-division more than one adult dose is contained in less than ten (10) of such sub-divisions.

(C) It shall be the duty of the State Board of Pharmacy to determine from time to time the adult medicinal dose of all substances, which are not specially named as poisons or as potent drugs, and which are to be determined as such by their dosage, and having so determined such other poisons and potent drugs, the State Board of Pharmacy shall publish lists of such other poisons and potent drugs so determined, and after ninety (90) days from date of such publication such poisons and potent drugs shall be delivered, dispensed and sold, only as may be provided by law. Within ninety (90) days after publication of what the State Board of Pharmacy determines to be a poison or potent drug, on the basis of the adult dose thereof, any person interested in such determination may apply for a hearing before the Board to submit proof that such determination with reference to any particular substance, compound, combination, mixture, or preparation, is erroneous, and if the Board becomes so satisfied, it shall rescind its order and publication with reference to such particular substance or substances, compound, mixture or preparation. In case the Board decides against the complainant, he shall have the right within thirty (30) days to appeal to any court of record having jurisdiction, for a review of the decision of the Board, and it shall act in compliance with the order of the court on final adjudication, and pending such final adjudication the determination of the Board with reference to the substance or substances, combination, compound, mixture or preparation, shall be held in abeyance.

SECTION 24: All chemicals, drugs, their compounds and preparations when of poisonous or potent character as defined in this Act, and when dispensed, distributed, or sold at retail to the consumer, except in original packages as manufactured and put up outside of the State in keeping with the laws of some other state or country, shall be in containers bearing a label for ready inspection, upon which such poisonous or potent drug content is plainly shown, as also the percentage thereof, contained therein. Provided, that when such chemicals and drugs are dispensed in keeping with a written record as made by a registered physician, dentist or veterinarian, and such written record is retained or filed by a pharmacist, physician, dentist or veterinarian, for at least one (1) year, the label requirement herein shall be satisfied when the container of the chemicals and drugs so dispensed bears a number or mark corresponding with a number or mark on the written record, so that it may be readily identified. Whenever chemicals and drugs, their compounds and preparations, manufactured outside of the State are dispensed, distributed or sold in original packages at retail to the consumer, without meeting the label requirements herein provided, it shall be the duty of the State Board of Pharmacy, by, and with the assistance of the State Drug Commissioner, to determine poisonous or potent drug content as herein defined, and upon such determination it shall list and publish the article under the name given it by its producer or manufacturer, as of either such poisonous or potent drug content, and thereafter such article shall be dispensed, distributed or sold, at retail within this State, only in compliance with the other provisions of this Act.

SECTION 25: Whoever knowingly sells or delivers to any person otherwise than in the manner prescribed by law, any poison or potent drug as defined in this Act, or sells or delivers in the manner otherwise prescribed by law any poison as defined in this Act, but without the written order of an adult, to a minor under sixteen (16) years of age, shall be fined not less than ten (\$10.00) dollars, nor more than fifty (\$50.00) dollars for each offense.

SECTION 26: Whoever sells or delivers to any person a poison as defined in this Act, except upon the written record of a registered physician, dentist or veterinarian, made and kept as provided in this Act, without having first learned by due inquiry that such person is aware of the poisonous character thereof, and that it is desired for a lawful purpose, or without plainly labeling the word "POISON," and the names of two or more antidotes therefor, upon the box or package containing it, or delivers such poison without recording in a book kept for that purpose for which it is alleged to be used, the date of its delivery, and the name and address of the purchaser, and the name of the dispenser, or fails to preserve said book for five (5) years, and submit it at all times for inspection to proper officers of the law, shall be fined not less than ten (\$10.00) dollars nor more than fifty (\$50.00) dollars for each offense.

SECTION 27: In this Section and its necessary Sub-Sections, are to be included the N. A. R. D. Model for a Narcotic Law.

SECTION 28: In this Section and its necessary Sub-Sections, are to be included the provisions of a Pure Food Law as based upon the terms and requirements of the Federal Food and Drugs Act.

THREE INJUNCTIONS.

First: Find yourself. Find who you really are and what you like best. Know your weak points and your strong ones. Only by knowledge of our weaknesses and constant effort can we overcome our failings. Find what you really want to be. Determine what you really want to be. Determine what you are naturally best adapted to do. Don't be misled by false glitter or another's success in a different occupation. Find your groove, your talent, and stick to it. Find yourself!

Secondly: Save yourself. Be careful of your physical being. Your health is a fortune and should be guarded more closely than your dearest possession. Learn economy of steps, of motion, of time. Be physically fit for any reasonable demand on your strength. Then go about your daily work with vigor, with enthusiasm, with pleasure. Save yourself.

Lastly: Give yourself. Give the world the best on your part. Don't expect to give a second-class article and receive pure gold. One's mind grows by sharing as well as does one's character.

—W. H. CLEMENS.

EDITORIAL NOTES

Editor: E. G. EBERLE, Bourse Building, Philadelphia, Pa.

Committee on Publication: J. W. ENGLAND, *Chairman*; G. M. BERINGER, CASWELL A. MAYO, H. B. MASON, E. L. NEWCOMB, and the Editor-in-Chief of the JOURNAL, General Secretary. Treasurer and Reporter on the Progress of Pharmacy, *ex-officio*.

Editorial Office: 253 Bourse Building, Philadelphia, Pa.

MAJOR D. A. COSSAR COMING TO THE UNITED STATES.

The Editor is in receipt of a communication from Mr. C. L. Butchers, Secretary of the Pharmaceutical Society of Australasia, which is of interest to pharmacists of this country. He writes:

"You will remember that I wrote you some three or four months ago relative to the proposed visit of Major Cossar to America. No doubt you have been wondering when Major Cossar will arrive in the United States. Up to the present time he has been in London and I ascertained to-day that he is likely to leave there for America about the end of March. I thought I would take the first opportunity of advising you so that you may have some idea of his arrival in your country.

"You will be pleased to hear that while Major Cossar was in London he succeeded in inducing the British War Office to grant twenty-one commissions to pharmacists in active service in France and Egypt. You will also be interested in the editorial in the February issue of the 'Australasian Journal of Pharmacy,' wherein reference is made to the satisfactory result of the investigation by a Royal Commission into the affairs of the Defence Department."

Pharmacists of the United States will be glad to welcome Major Cossar, and we may hope that he will have information to give us that will be helpful in our promotion of a Pharmaceutical Corps for the U. S. Army.

ORGANIZATION AND WORK OF PHARMACISTS IN FOREIGN ARMIES.

Caswell A. Mayo, speaking before the Committee on Military Affairs of the House on the subject assigned him, said in part, as follows:

"Pharmacists rank as commissioned officers in the armies of all the countries except those of the United States and a part of those of Great Britain, for by a singular anomaly, some

of the Canadian pharmacists have been given commissions and the Australian army has a regularly organized corps of commissioned pharmacists with a major at its head, while under the title of quartermaster England herself has commissioned some pharmacists.

"In the French army the head of the corps is the brigadier-general. He is, or before the war was, a colonel in the German, the Japanese, and the Spanish armies. He is a lieutenant-colonel in the armies of Italy, of Belgium, of Holland and of Austria; he is a major in the armies of Switzerland, of Norway, of Sweden, and of Australia, for, notwithstanding the fact that the Australian troops are part of the British army they maintain a separate organization, which, in this respect at least does not conform with that of the mother country.

"The history of the Medical Department of the United States Army, compiled by Assistant Surgeon Harvey E. Brown, under the direction of the Surgeon-General, shows that from the organization of the Continental Army in 1775 down to 1821, the United States Army was provided with an Apothecary General as well as with a Surgeon-General, and that the Apothecary General and his assistants were specifically charged with the provision, testing, and distribution of medical and surgical supplies. In the year 1821 all the regimental surgeons were done away with as well as the Apothecary General and his assistants under a régime of most searching economy, consequently the recognition of pharmacy in the United States Army by the introduction of such a corps as we propose would really be returning to first principles and not to a novelty as many think."

THE MEDICAL DEPARTMENT OF AN ARMY OF FIVE MILLION MEN.

It has been stated by authorities on the subject that an army of five million men will be required of the United States; probably

no less than an army of half that number has been spoken of by anyone familiar with the needs of the situation. If this is the case, upwards of 30,000 medical men will be called for. The most conservative will admit that qualified pharmacists can relieve the doctors of some of their work, or that which they now must do. Dr. J. Madison Taylor, of the Medical Department of Temple University, in speaking before the Committee on Military Affairs of the House, prefaced his remarks by saying:

"We physicians who appear before your committee would count ourselves blameworthy in advocating the establishment of a Pharmaceutical Corps in the military service, did we not believe on good authority we were rendering an important service to the Nation and the Nation's defenders."

Later in his able presentation, Dr. Taylor said:

"Among the particular services a specially educated pharmacist could render are these:

"He could supplement and contribute to the correlating data for the surgeon, in short in the 'paper work.'

"He could perform a large part of the clinical laboratory work. Urinalyses, blood examinations (morphologic or pathologic), in Cytology, Serology, Vaccine preparations, Bacteriology in the preparation of microscopic slides; in the examination of gastric contents, feces, exudates, transudates, and the like.

"He could apply tests such as Wassermann, Noguchi, Widal, etc., all chemical procedures; he could keep all the material for these tests up to date.

"He could supplement in X-ray work; keep the mechanism of Roentgenology in order, print plates, etc.

"Many chemical problems arise in connection with poison cases. He could prepare all special materials for such procedures as hypodermoclysis, blood transfusion, Carrell-Dakin solution, etc. He could examine water, water supplies, all articles of food and drink, milk, meats, and the like, which must be critically estimated.

"Those who desire to become candidates for military service are already seeking instruction and experience in meeting minor surgical and medical emergencies, in the dressing of wounds, in the adjustment of dressings, solutions.

"One surgeon and two pharmacists could

probably do as much good work as two or even three surgeons.

"The claim is made by the opponents of the Pharmaceutical Corps that the medicines or drugs used in the army are very simple and few, and served mostly in tablet form, readily handed out by any bright, alert enlisted man selected and trained for the purpose. How about the poisons? How many blunders are made by such an elementary form of dispensing? Full knowledge of the properties of death-dealing chemicals is an absolute essential for the man who handles them.

"I have been credibly informed that the official Army Drug Table authorized by the Secretary of War comprises nearly 600 drugs and drug products of all kinds, *including poisons of the deadliest character*. Also that this drug table or list is admitted to be only the 'minimum number of articles essential to the Nation's Medical activities.'

"Obviously the preparation, compounding, and especially the dispensing of such dangerous products demands trained pharmacists. Note the gravity of this problem, the hideous peril run by our home defenders by such haphazard distribution.

"How many fatal blunders have occurred? How can the surgeon keep control of the leaks in the chain of procedures from bottle to patient? How many curious inexplicable cause of deaths?

"Should an error be suspected by the enlisted man who dispenses poisons, there is every temptation to keep quiet and thus escape blame. Clearly our home defenders deserve fully as much special skill in the distribution of drugs as do our home makers."

MILITARY MORALS.

One of the uses of the proceeds of the Liberty Loan that will appeal strongly to the great mass of American people is the care and attention given to the moral welfare and protection of the American soldiers.

It is to the glory of American arms and American national character that of the men who wear the United States uniform a high standard of conduct is expected and demanded, and provided for. Kipling's "Single men in barracks" are not to find their prototypes in the American Army.

Gen. Pershing says there is no cleaner-living body of men in the world than the American Army in France.

THE COMMON FROG'S HEART UNSUITABLE FOR DIGITALIS STANDARDIZATION.

The isolated heart of the common frog, *Rana temporaria*, should not be used for accurately standardizing digitalis, since it absorbs part of the active principles, and therefore behaves differently from the heart of the edible frog, *R. esculenta*, which alone should be employed for the purpose. The common frog's heart may prove useful as a control; and rough determinations within ten percent of accuracy may be made with it with digitalis and strophanthus.—M. Krough (*Ugeskrift for Læger, J. Amer. Med. Assoc.*, 1917, 68, 1672).

SACCHARIN AS A SUGAR SUBSTITUTE.

Speaking at a conference at the Food Saving Exhibition, in London, January 31, Sir Charles Bathurst, M. P., announced that the output of saccharin would be more than trebled during the next three months. Its price would be reduced, and supplies made available for people who took tea and coffee in restaurants and teasops where, under the new order, no sugar would be supplied for such beverages.—*Pharmaceutical Journal and Pharmacist*.

Prof. Charles H. LaWall, president-elect of the American Pharmaceutical Association, was given a dinner by the Philadelphia Branch of the American Pharmaceutical Association, March 5, at the City Club of Philadelphia. Besides members of this Branch, President A. R. L. Dohme, Dr. Harvey W. Wiley, a large delegation from New York and members of the Chemical Society and Medical fraternity were present. Dr. H. V. Army, of New York, presided as toastmaster. A delightful part of the speaking program was the tribute paid to the mother of Professor LaWall and to Mrs. LaWall, both by speakers and in the response of the guest of honor. The large attendance from New York was a splendid evidence of the esteem in which the latter is held, and also of the cordiality of the Association members.

Dr. Frederick B. Power, who is engaged in the Bureau of Chemistry and also on the Chemistry Committee of the National Research Council, has been elected president of the Washington Chemical Society and vice-president of the Washington Academy of Sciences. Dr. Power has been a member of the American Pharmaceutical Association since 1872.

F. A. Upsher Smith has received fine responses to his efforts in behalf of conserving sugar, glycerin and alcohol. Most of the departments of the Government interested in these products expressed their appreciation of the efforts.

Lieutenant Commander C. B. Mayo, who is on duty in the Bureau of Navigation, in Washington, has received cabled notice of the safe arrival in France of his brother, Ensign Thomas F. Mayo, an intelligence officer in the Naval Aviation Corps. These officers are the sons of Col. John P. Mayo, U. S. Immigration Commissioner at New Orleans, who was formerly head of the Mayo Drug Company, of Columbus, Miss., and nephew of Caswell A. Mayo, editor, *American Druggist*.

Thomas Tyrer, F.C.S., F.I.C., died in London, February 21, aged 74 years. His scientific education was definitely entered upon in 1861 under the celebrated German chemist, Hofmann; he studied biology under Huxley and physics under Tyndall. While most of the work of the deceased was in chemical lines, he was president of the British Pharmaceutical Conference in 1907. The subject of his presidential address was "Research," and had particular application to pharmaceutical science in all its aspects. The closing words sounded a note of appeal for increased and effective attention to the cultivation and development of research principles and methods. He was a leader in his particular field of activity, highly honored and respected in his own country and favorably known in the United States.

Hugh Craig, for a number of years editor of the *N. A. R. D. Journal*, has accepted a position with Frederick Stearns & Co., of Detroit. A farewell dinner was given him by the Chicago Branch, A. Ph. A. Wishes for success in his new activity were tendered to him by the members, and expressions of regret were general because of his leaving Chicago.

The Weinstein Prize has been founded by the New York Retail Druggists' Association in memory of the late Dr. Joseph Weinstein, who for many years was active in the A. Ph. A. The prize consists of a microscope to be awarded for proficiency in analytical chemistry to a student of the graduating class of the New York College of Pharmacy.

OBITUARY.

ALFRED BIRCH HUESTED.

In the last issue of the JOURNAL a brief sketch of Dr. A. B. Husted is printed, a cut which was to accompany the same came too late for use at that time. Dr. Willis G. Tucker, dean of the Albany College of Pharmacy, has prepared a sketch of the deceased for the Albany Academy and in this the writer pays well-deserved tributes to the deceased. We can quote only briefly and have chosen a paragraph which depicts Dr. Husted as we knew him.

ALFRED B. HUESTED, M.D., Ph.G.

"He was growing older but his eye was bright, his step elastic, his manner as buoyant and his greeting as cheery and as cordial as ever. His mind was to him his kingdom. It was well stored with knowledge and upon its accumulated stores he could at all times draw for his own edification, refreshment and recreation, and for the instruction and entertainment of others. He was a conscientious, just and fair-minded man, whose disposition was philosophical, and whose attitude on any matter of moment was always and instinctively reasonable, tolerant and free from prejudice. To the close of his life he retained in a remarkable degree his youthful vigor, health and mental alertness, and this

was largely due to the general sanity of his life, the acts of which were prompted by reason and not by impulse or passion. His bent was charitable and his disposition kindly. He never spoke angrily or intemperately, seldom even hastily, and he was as slow to take as he was unwilling to give, offense."

Dr. Tucker closes his sketch as follows:

"Success in life is variously measured. Fame, influence and wealth are thought by many to denote it, but others, and with saner view, hold that life is successful which has been devoted to the conscientious performance of duty, to useful work honestly done, to unselfish service to mankind. Judged by this standard, the life here briefly and imperfectly delineated, was preëminently successful, and he who lives such a life can anticipate its inevitable close with serenity because its end is peace."

FERDINAND C. SCHAPPER.

Ferdinand C. Schapper, born at Besselich, near Coblenz, Germany, November 1, 1853, died after an illness of 10 days on February 24, of pneumonia. Mr. Schapper was a graduate of the Real gymnasium, Friedrichsdorf, in 1870. He went to Blue Island, Ill., in 1872, starting in with his uncle as druggist. In 1877 he went to Chicago and started a drug store on Halstead Street, near Willow, then on the northern extremity of the city. In 1885 he became the Chicago representative of the Roessler & Hasslacher Chemical Company, of New York, and was the first resident representative in this particular industry, building up a large business. After continued services extending over a period of 32 years he retired last March. He was a member of the American Pharmaceutical Association since 1913.

SAMUEL MANSFIELD.

The late Samuel Mansfield, who for many years held the office of Treasurer of the Maryland College of Pharmacy previous to it becoming a department of the Maryland University, died suddenly on March 9, 1918. He was a member of the American Pharmaceutical Association and a man of character and repute, not as a pharmacist only, but for reliable business methods.

He was much esteemed by his colleagues of the Maryland College of Pharmacy for his accuracy and devotion to its welfare. He was

also high up in the Masonic orders and held the office of Treasurer.

He was born in Kent County, Md., Sept. 27, 1845, and became an apprentice in pharmacy to his cousin, the late James W. Bowers, in 1865—in the Pharmacy where he died, and which his cousin established at 1001 W. Baltimore Street in 1851. Mr. Bowers retired from the business in 1877 and Mr. Mansfield be-

came his successor, forty years ago. He was in his 73rd year and in pharmacy 53 years at the time of his death.

Mr. Bowers gained a substantial knowledge of pharmacy in three of the best stores of Baltimore and conducted an ethical business on his own account which was continued by Mr. Mansfield to the time of his death.

JOHN F. HANCOCK.

SOCIETIES AND COLLEGES.

HEARING ON THE EDMONDS BILL.

Under Editorial and Editorial Notes reference has already been made to the hearing on the Edmonds bill before the Committee on Military Affairs of the House; here we are in part drawing upon the report in the *N. A. R. D. Journal* for other portions of the presentation. It is gratifying to note that no less than fifty-one organizations were represented. It was evident that the committee had heard from the Surgeon-General and that they were more or less impressed that he was the most competent judge of how best to increase the efficiency of the Medical Department of the Army.

Representative Edmonds opened the hearing with the statement that pharmaceutical interests were represented from the Atlantic to the Pacific and from the Great Lakes to the Gulf of Mexico. He then asserted that the merits of the bill would be presented by selected speakers, and he introduced them to the committee. Dean Wulling insisted that the judgment of pharmacists is better than that of physicians as far as pharmaceutical questions are concerned, because pharmacists are specialists in their profession and better qualified to pass on pharmaceutical matters. He maintained that pharmacists are not in a position to-day to give the army the efficient service it requires and is entitled to, simply because there is no pharmaceutical corps in the army. The resources of pharmacy can not be marshalled under the existing organization. The American soldier at the front is to-day denied the pharmaceutical service which the civilian at home enjoys. Dean Wulling showed how the standards of pharmacy are being raised all over the country, and its efficiency, regularly increased. He said that the pharmacist and the physician are allies in the safeguarding of health and life.

He controverted the statement that manufacturers are opposed to the Edmonds bill,

which was shown to be the case when Mr. Cronse, of the N. W. D. A., read a very emphatic and patriotic letter from Dr. William Jay Schieffelin, of New York, favoring the bill. Dean Wulling pointed out that the main question was: "What shall and must be done to give the sick soldier the best service?" In private life there is the licensed pharmacist provided by state boards of pharmacy. In the army this is not the case. He resented the allegation that pharmacists are self-seeking in urging the passage of the Edmonds bill. He said that most of the restrictive legislation on the statute books of the states had been placed there by pharmacists themselves. He admitted that officers had detailed pharmacists here and there in the army to fill certain positions where their qualifications and experience could be availed of, but he contended that, because of their position as privates, they were not consulted, and could not with propriety advise their superiors.

Dr. Charles E. Caspari pointed out that the United States Pharmacopoeia and National Formulary, which provide the standards for drugs and chemicals in the enforcement of the food and drugs act and furnish the tests for the purity of drugs and chemicals, are in the main the work of pharmacists. Physicians select the drugs to go into the United States Pharmacopoeia and National Formulary, but pharmacists determine their purity. Many physicians are not qualified to make a solution for the treatment of wounds, Doctor Caspari said. The pharmacist works hand in hand with the physician, not under him, and his work is as important and necessary to the public welfare as that of the physician.

Samuel C. Henry deprecated the fact that there has been too much talk about rank and pay for pharmacists in the army. If that had been the consideration, he would not be before the Committee urging the passage of the Edmonds bill. With a lifetime spent in prae-

tical and professional pharmacy, pharmacists surely were in a better position to advise the Committee with respect to the need of a pharmacal corps in the army than physicians. Every day physicians ask pharmacists for advice as to the compounding of prescriptions and thereby save human lives.

He left it to the Committee to say whether or not conditions in the army as revealed by recent testimony before congressional committees do not demand a change in the existing order of things for the welfare of the boys in the trenches. He then told of a communication he had received from a druggist who had just paid the last of an indebtedness of \$10,000 on his store and who had been drafted to serve in the army not as a pharmacist, while others, without any experience in pharmacy whatever, were rendering pharmacal service. Mr. Henry suggested that the Committee ask the War Department for the name and address of every man in the army dispensing medicines, and in that way learn of facts relating to this part of the service.

NEW JERSEY IS SUCCESSFUL IN SECURING A PREREQUISITE LAW.

After many efforts on the part of New Jersey pharmacists a prerequisite law has been placed on the statute books of their state. News of this kind is always welcome and shows that progress is being made for better pharmacy, and the persistent workers of the New Jersey Pharmaceutical Association and the State Board of Pharmacy are to be congratulated on their success.

LOUISIANA N. A. R. D. MEMBERS PREPARE FOR THE ANNUAL CONVENTION AT NEW ORLEANS AND ENTERTAIN PRESIDENT W. H. COUSINS.

A committee composed of A. Di Trapani, Robert F. Grace, W. H. Cousins, Geo. W. McDuff, Christian Schertz, Adam Wirth, Edward Henry Walsdorf, Andrew McCullen, representing various pharmaceutical associations met at the Grunewald Hotel, New Orleans, March 19, to organize the committee to take charge of the Convention of the National Association of Retail Druggists. The date for the convention was set for September 16-20 and the Grunewald Hotel was selected as headquarters.

The following officers and chairmen were elected. George W. McDuff, chairman; M. T. Breslin, vice-chairman; Edward Henry Walsdorf, secretary; Vic. Masson, treasurer.

Committee names were: Exhibits, Christian Schertz, chairman; A. D. Parker, vice-chairman.

Program, Robert F. Grace, chairman; S. G. Steiner, vice-chairman.

Registration, A. Di Trapani, chairman; John W. Phillips, vice-chairman.

Transportation, Adam Wirth, chairman, F. A. Dicks, vice-chairman

Music and Decorations, M. Stolzenthaler, chairman; W. H. Curtis, vice-chairman.

On Monday, March 18, a banquet was given in honor of W. H. Cousins, president of the N. A. R. D., at Hotel De Soto. The pleasant affair was well attended by representatives of various associations, and druggists of New Orleans joined in the festivities.

PORTRAIT OF DR. J. O. SCHLOTTERBECK PRESENTATION DURING FIFTIETH ANNIVERSARY CELEBRATION OF UNIVERSITY OF MICHIGAN COLLEGE OF PHARMACY.

A fine life-size portrait of the late Dr. Julius O. Schlotterbeck will be presented to the College of Pharmacy of the University of Michigan by the Alumni next June, during the celebration of the 50th anniversary of the College.

Confident of the support of the Alumni body, a group of Detroit Alumni have contracted with Leon Makielski, an artist who has done much notable portrait work in Ann Arbor, to paint this portrait. His selection is approved by Mrs. Schlotterbeck, who was asked to nominate the artist, and she will cooperate with him to secure a wholly satisfactory likeness.

While primarily the Alumni have been called upon to donate toward the expense, it is assumed that many friends of Dr. Schlotterbeck will desire to contribute. The members of the committee in charge are: A. S. Parker, F. A. Thompson, G. M. Schettler, L. A. Seltzer, J. W. T. Knox, W. H. Blome, O. W. Gorenflo and F. F. Ingram.

Dean A. B. Stevens is the treasurer, to whom remittances should be made payable, but sent to F. F. Ingram, Jr., Secretary, Detroit, Mich.

THE PHARMACIST AND THE LAW.

MODIFICATION IN EXPLOSIVES ACT.

In conjunction with A. Homer Smith, of the Medical Section of the Council of National Defense, Chas. J. Lynn, President of the American Drug Manufacturers' Association, held several interviews with the Bureau of Mines and secured a comprehensive interpretation of the law as it applies to the drug trade. This matter was formally incorporated in a letter from the Medical Section to the A. D. M. A. that was first submitted to the Bureau of Mines for approval. It can, therefore, be regarded as an accurate reflection of the Bureau's interpretation.

"1. The following gives information pertaining to the Explosive License Requirement Act concerning the application of the Act as related to medicinal substances.

MANUFACTURERS.

"a. Require manufacturers' license. (I'd. Note—only obtainable from Bureau of Mines.)

"b. Do not require Foreman's license for Department heads.

"c. Must have on file certified actual copies or certified photographic copies of customers' license before deliveries can be made. The mere information of customers' license number will not be sufficient to justify shipment or delivery of items coming under the operation of the Act. Likewise, manufacturers must file with their suppliers a certified copy of their own license in order to obtain their crude materials.

"d. The Bureau of Mines will accept the ordinary trade records of transactions covering medicinals in lieu of the specific records required of manufacturers, vendors, and purchasers of explosives as such. *They do require*, however, that the number of the buyer's license must be placed on his order covering the ingredients purchased and filed by the seller in the usual way and also must appear on the invoice sent the buyer covering his purchase.

"e. Medicinal compounds containing any of the ingredients named where the compound as such is non-explosive are not affected. Medicinal products containing explosive ingredients in simple form such as chlorate of potash tablets, permanganate of potash tablets, when sold in quantities of one ounce or more, come under the operation of the Act and require license all the way down to the ultimate purchaser from the retailer."

WHOLESALESA.

"Require Vendors' license unless they also manufacture, in which event a manufacturer's License is necessary which will cover their transactions.

"Paragraphs b, c, d and e, under 'Manufacturers,' apply to wholesalers."

RETAILERS.

"a. Require vendors' license.

"b. One license for the store covers proprietor and clerks.

"c. Cannot sell in quantities of one ounce or more on prescription or otherwise except to customer having purchasers' license. Such purchasers' license need not be filed with retailer, but must be shown in every instance before delivery is made.

"d. No special record required for sales of quantities of less than one ounce, but, unless on prescription which filed becomes an acceptable record, sales of quantities of one ounce or more must be recorded as to purchaser's license number, name, address, date of sale, item and quantity sold.

"e. Must file with sources of supply certified copy of his vendors' license before his supplier can make deliveries."

PHYSICIANS.

"a. If a dispenser, must have a vendor's license to purchase and dispense in quantities of one ounce or more.

"b. Cannot dispense in quantities of one ounce or more to patient who does not hold a purchaser's license.

"c. If a prescriber, only, will require a purchaser's license to obtain supplies in quantities of one ounce or more for his own use.

"d. No special records required."

CONSUMERS.

"Require a purchaser's license to buy in quantities of one ounce or more.

EXEMPTIONS (MEDICINAL).

"Nitroglycerine in official U. S. P. solution or in form of pills, granules or tablets containing not more than $\frac{1}{10}$ grain each.

"PLEASE NOTE: The foregoing apply only to medicinals and not to explosives sold for other purposes. If a salesman personally sees customer's license and places the license number on the customer's order when sending it to his house, then his house can assume the responsibility of making delivery without having a certified copy of the customer's license on file. To expedite deliveries on mail, telephone and telegraph orders received direct

from the customers, however, it will be found advisable to have certified copies of customers' licenses on file."

(Signed)

A. HOMER SMITH,

Asst. to the Chief, Medical Section.

WAR SERVICE COMMITTEE,

WILLARD OHLIGER, *Chairman,*

F. G. RYAN, *Secretary.*

DONALD MCKESSON,

A. G. ROSENGARTEN,

CHAS. J. LYNN.

CHANGES OF ADDRESS.

All changes of address of members should be sent to the General Secretary promptly.

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of the change of address is received before shipment or mailing.

Both the old and the new address should be given thus:

HENRY MILTON,

From 2342 Albion Place, St. Louis, Mo.

To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or typewritten.

CHANGES OF ADDRESS SINCE FEBRUARY 5, 1918.

JENNINGS, R. C.

From 114 William St., New York, N. Y.

To 5217 Cornell Ave., Chicago, Ill.

UNITED STATES PUBLIC HEALTH SERVICE.

List of changes of duties and stations of commissioned and other officers of the United States Public Health Service.

Pharmacist A. M. Roehrig. Relieved at Buffalo, N. Y. Proceed to Marine Hospital, Savannah, Ga. Feb. 15, 1918.

Pharmacist W. L. Stearns. Relieved at Stapleton, N. Y. Proceed to Marine Hospital, Buffalo, N. Y. Feb. 15, 1918.

Pharmacist E. M. Holt. Relieved at Savannah, Ga. Proceed to Washington, D. C., and report to Assistant Surgeon-General W. G. Stimpson for duty. Feb. 15, 1918.

Pharmacist L. C. Spangler. Relieved at the Purveying Depot. Proceed to Marine Hospital, Stapleton, N. Y. Feb. 15, 1918.

Pharmacist Herschel Megaw. Relieved at the Bureau. Report for duty at the Purveying Depot, Washington, D. C. Feb. 15, 1918.

Asst. Epidemiologist F. E. Harrington. Relieved at Anniston, Ala. Proceed to Hattiesburg, Miss., on special temporary duty. Feb. 16, 1918.

Sanitary Engr. C. N. Harrub. Proceed to Jacksonville, Fla., on special temporary duty. Feb. 12, 1918.

Asst. Sanitary Engr. Frank R. Shaw. Relieved at Hattiesburg, Miss. Proceed to Anniston, Ala., on special temporary duty. Feb. 16, 1918.

Scientific Asst. W. L. Wood. Proceed to Tenafly, N. J., on special temporary duty. Feb. 12, 1918.

Pharmacist Charles Miller. Reassigned to duty at the Marine Hospital, Key West, Fla., from Feb. 13, 1918. Feb. 20, 1918.

Sanitary Chemist A. F. Stevenson. Proceed to Newport News, Va., for conference in regard to installation of a pasteurizing plant. Feb. 25, 1918.

Scientific Asst. G. S. Bote. Proceed to Cin-

cinnati, Ohio. Lexington, and Louisville, Ky., for inspection of pasteurizing plants in connection with proposed establishment of plant at Maysville, Kentucky. Feb. 23, 1918.

Pharmacist Edward Rogers. Relieved at Ellis Island, N. Y. Proceed to Marine Hospital, Boston, Mass. March 5, 1918.

Pharmacist G. K. Hepler. Relieved at Marine Hospital, Cleveland, O. Proceed to Marine Hospital, Fort Townsend, Wash. March 5, 1918.

Pharmacist F. A. Stump. Relieved at Marine Hospital, Boston, Mass. Proceed to Marine Hospital, Cleveland, Ohio. March 5, 1918.

Asst. Epidemiologist C. C. Applewhite. Relieved at Atlanta, Ga. Proceed to Tenafly, N. J., on special temporary duty. Feb. 28, 1918.

Asst. Sanitary Engr. C. P. Rhynus. Relieved at Columbia, S. C., Rejoin station at Washington, D. C., for duty in connection with the investigation of steam pollution. March 4, 1918.

Chief Sanitary Inspector Wallace Purrington. Attend convention Southeastern States Health, Food and Drug Officials' Association, at Savannah, Ga., March 6-7, 1918. March 2, 1918.

Consulting Epidemiologist W. B. Wherry. Proceed to Berea, Kentucky, to cooperate in investigations of meningitis. Feb. 4, 1918.

Scientific Asst. J. Floyd Samar. Relieved at Detroit, Michigan. Proceed to Waterbury, Conn., for duty in studies of industrial fatigue. Jan. 31, 1918.

Sanitary Bacteriologist C. H. Spaulding. Relieved in connection with investigations of coastal waters, and proceed to Macon, Ga., for duty in malaria investigations. Jan. 23, 1918.

BOOK NOTICES AND REVIEWS.

U. S. Dispensatory, 20th Edition.—Besides the latest editions of the United States Pharmacopoeia and National Formulary, every well-regulated pharmacy should possess a library, even if only one shelf full, of reference books. Among those the most important is a dispensatory. All countries have commentaries on their pharmacopoeias, as, for instance, Hager in Germany, Vogl-Ludwig in Austria, Dorvault in France, the Pharmaceutical Codex in Great Britain, Orosi in Italy, etc. Pharmacy in the United States can justly be proud in having not only one but three dispensatories.

The oldest one of these is the "U. S. Dispensatory," the 20th edition of which has just been published. Let me quote the following from the preface of the first edition of this work, dated Philadelphia, January 1833. "We have a National Pharmacopoeia, which requires an explanatory commentary, in order that its precepts may be fully appreciated, and advantageously put into practice. On these accounts, it is desirable that there should be a "Dispensatory of the United States," which, while it embraces whatever is useful in European pharmacy, may accurately represent the art as it exists in this country and give instruction adapted to our peculiar wants." Eighty-five years have passed since these words were written by Dr. George B. Wood and Dr. Franklin Bache and they still hold good this very day. From the small "Wood and Bache Dispensatory," of 1073 pages, the book has now become a master work, an authoritative encyclopedia on pharmacy, chemistry, botany, materia medica and therapeutics. The Historical Title Page, page ii, gives an excellent account of the evolution of the U. S. Dispensatory during its life of 20 editions.

The 20th edition just published and before us is a stately volume of 2150 pages, bound in buckram, which wears much better than leather. The editorial staff consists of experts of national and even international reputation, namely, Professors Joseph P. Remington, Samuel P. Sadtler, Horatio C. Wood, Jr., Henry Kraemer, Charles H. LaWall and John F. Anderson. These men are so well known to both the professions of pharmacy and medicine that no further introduction is necessary. It is to be regretted that the editor-in-chief, Joseph P. Remington, died while this edition was in the press

and could not see the present stately master volume.

That the 20th edition of the Dispensatory was not rushed or revised in haste can be seen from the following dates: The U. S. P. IX was published in August 1916, and the present edition of the Dispensatory in March 1918, and consequently 20 months of hard work were required to prepare the 20th edition of the "U. S. Dispensatory." The work has been brought up to date in conformity with the rapid advances in the pharmaceutical and medical sciences. No other book in the English language can be compared favorably with this edition of the U. S. Dispensatory in the extent of subjects and the method of treatment.

Among the valuable features of the present edition are the lists of synonyms, the insertion of alternative quantities in the formulae of the official preparations, the use of diacritical marks as a guide to pronunciation, and the list of official preparations at the end of the monographs of the official drugs. The use of these diacritical marks is a feature which should be especially appreciated by teachers and students and should also be of great help to make the pronunciation of Latin titles more uniform. The dose of each drug is given at the end of the description of its therapeutic uses, whereby the information which is usually wanted in a hurry is found in an instant. The quantities given are not intended as strict minimum and maximum doses, but merely to serve as a guide to the amounts generally used.

The 20th edition of the "U. S. Dispensatory" is a true commentary upon the latest revisions of the United States and British Pharmacopoeias. This, together with comments upon those preparations of the German Pharmacopoeia and the French Codex which are used generally in the United States, comprises Part I, which contains 1221 pages. How thorough the monographs in this part are written can be seen from the following two examples: Under *Acidum Salicylicum*, U. S., Br., the arrangement is as follows: U. S. P. and Br. P. definitions, Synonyms in English, German, French, Italian and Spanish, History, Preparation, Properties, Assays of U. S. P. and Br. P., Tests, Uses and Therapeutic Action, Dose and Official Preparations in U. S. P., Br. P., and N. F. The monograph of *Zingiber*, U. S., Br., is thus arranged: Defini-

tions, Synonyms, Commercial Varieties, Descriptive paragraphs on Jamaica, African, Calcutta, Calicut, Cochin and Japanese Ginger, Constituents, Uses, Dose and Official Preparations. The three full, double-column pages are proof of the thoroughness of this monograph. As a commentary on the Pharmacopoeias this part can not be excelled. One of the features are the many references to pharmaceutical, chemical and medical literature, because it enables the reader to consult the original article when he finds the abstract insufficient.

In Part II the National Formulary and other non-official drugs and chemicals are described on 451 double-column pages. The type in this part is smaller, by which arrangement the reader can at once differentiate between the pharmacopoeial and other drugs. While the limit of the present volume forbids an exhaustive description of all these substances, the subject is treated in an excellent way and the most essential information is given besides the key to the pharmaceutical, chemical and medical literature.

Part III is divided into two sections. The first contains Reagents, Test Solutions and Volumetric Solutions of the U. S. P. and Br. P., Biological Assays, Elements, Pharmacopoeial Chemicals and their Atomic or Molecular Weights, Thermometry, Weights and Measures, Alcohol and Other Tables. Section II contains an abstract of the preparations of N. F. IV, without, however, giving working formulas, according to the agreement with the A. Ph. A. In the opinion of the reviewer, this Section on the N. F. deserves to become Part IV of the "U. S. Dispensatory" and should also be improved by giving the history and uses of the most important galenicals.

The Preface of the work contains: Abbreviations, Table of Abbreviated Tables of Journals and Books, Glossary of Medical Terms, Index of Diseases, The Food and Drugs Act, Food Inspection Decisions, Harrison Narcotic Act and Regulations, and last, but not least, Index to Food and Drugs Act and Harrison Narcotic Law. The publication of these two laws and regulations in this book places same into the hands of pharmacists, wholesale and retail for easy reference. By referring to the special index of these decisions the reader can at once find an abstract, which is a great convenience, as these decisions are not always readily obtainable.

The Index of the "U. S. Dispensatory" oc-

cupies 170 pages in 3 columns in small type. The index is a key to a book and Prof. E. Fullerton Cook is to be complimented upon this well-fitting key.

The publishers, the J. B. Lippincott Company, are to be congratulated upon the typography and the make-up of the work. For a book of its size, it is remarkably light in weight and easy to handle, due to the use of light weight, but durable, paper. Much space has been saved by the use of smaller type in Part II, dealing with non-pharmacopoeia drugs. The binding in buckram is very durable and will no doubt last for ten years, when the next, the 21st edition, will be published.

The editors are to be complimented on so worthy a contribution to American pharmaceutical literature. Works of this kind will greatly help to improve American pharmacy and give our brethren across the great pond an idea of "what is doing" in the United States. The book is a wonderful repository of information concerning drugs and medicines, a real encyclopedia of pharmacy, a master work, which will be an everlasting monument to the editor-in-chief, the late Prof. Joseph P. Remington.

Let us hope that the 20th edition of the "U. S. Dispensatory" will be bought and used by pharmacists, druggists and physicians throughout the United States and English-speaking countries. Besides the many advantages already pointed out, this work will be a great help to the retail pharmacist who is daily confronted with numerous problems in the drug business and quite especially behind the prescription counter.

OTTO RAUBENHEIMER.

PUBLICATIONS RECEIVED.

A Guide to the Organic Drugs of the Ninth Revision of the United States Pharmacopoeia, the Third Revision of the National Formulary, a Few of the More Commonly Used Unofficial Drugs, and other Useful Information.—Compiled and arranged by John S. Wright. Revisions and Additions by Francis A. Federer and Harry W. Tuft. Third Revision, with Appendix. 70th Thousand. Prepared for Students of Pharmacy. Published from The Botanical Department by Eli Lilly & Company, Indianapolis, U. S. A. Price, 25 cents. That the copies of this handy guide have been printed to the number indicated is sufficient evidence of its value. The latest edition—just off the press—contains in addition to the

information on the organic drugs of ninth revision of the U. S. P., the same facts concerning the third revision of the National Formulary and the more commonly used unofficial drugs. Included in this vest pocket compendium are a conspectus of plant families, a glossary of botanical and therapeutical terms used and an index of botanical synonyms.

Still another feature of this handy reference booklet is a table of poisons and antidotes, rules for comparing Fahrenheit and Centigrade scales, phrases and abbreviations used in prescription writing, Latin genitive case endings, symbols and signs used in prescriptions, the Metric system of weights and measures and a table of equivalents.

FIND ADULTERATED DRUGS.

DEPARTMENT OF AGRICULTURE INVITES CRITICISM OF PROPOSED RULINGS.

The officials in charge of the enforcement of the Federal Food and Drugs Act have found certain impurities in pennyroyal leaves. In order that the trade may know what the United States Department of Agriculture regards as adulterants of this product it is proposed that a service and regulatory announcement be issued outlining the opinion of the department. Before issuing the announcement, the department desires to obtain the views of the trade or other interested parties as to the fairness of the ruling. Communications should be addressed promptly to the Bureau of Chemistry, Department of Agriculture, Washington, D. C. All criticisms will receive careful consideration. The proposed announcement follows:

"INFERIOR PENNYROYAL LEAVES.—Examination of samples of pennyroyal leaves, *Hedeoma pulegioides* (Linne) Persoon, has disclosed that in a large number of instances, the product has been very carelessly collected and frequently contained very large amounts of sand, stems and other foreign material. From the data at hand, the bureau is of the opinion that properly collected pennyroyal leaves should contain not more than 10 percent of stems, not more than 16 percent of total ash and not more than 6 percent of acid-insoluble ash (sand), and will consider as adulterated, under the Food and Drugs Act, any material which does not comply with these figures. Further investigation may reveal the necessity of establishing a more rigid requirement, in which case due notice will be given."

PULVIS UNNA.

Dr. H. V. Army states (*C. U. C. P. Alumni Journal*) that by this title, the prescriber undoubtedly means *pulvis fluens hydrargyri*, a powdered form of mercury, made by rubbing mercury with talcum powder and a little oil of turpentine. In another recipe a 30 per cent powder is directed to be made by triturating thirty grams of mercury with five grams of oil of turpentine and fifteen grams of lycopodium until it is extinguished, after which it is diluted with fifty-five grams of powdered wheat starch. For further details, see Year Book of the American Pharmaceutical Association, 1915, page 210; 1916, page 281.

JOURNAL ANNOUNCEMENTS.

Subscriptions: Annual subscriptions in advance, including postage: United States and Mexico, \$4.00; Canada, \$4.35; foreign countries, \$4.50. Single copies, 35 cents. Remittances should be made payable to Treasurer H. M. Whelpley, but mailed to JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 211 Church St., Easton, Pa., or 253 Bourse Building, Philadelphia, Pa. Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers.

Requests for Back and Missing Numbers: Requests for back and missing numbers should be typewritten and sent to the Editor. Claims will not be allowed if sufficient notice has not been given of change of address, and in no case if received later than sixty days from date of issue. Notice of change of address should give old and new address.

Contributions: The JOURNAL accepts no responsibility for the opinion of its contributors. Contributions should be type-written and sent to the Editor; use only one side of the sheet for writing, and double-space the lines. Articles are accepted for publication on condition that they are contributed solely to this JOURNAL; and "all papers presented to the Association and its Branches shall become the property of the Association, with the understanding that they are not to be published in any other publications than those of the Association, except by consent of the Committee on Publication." (By-Laws, Chapter X, Article 11.)

Reprints: Authors may obtain reprints of the Eschenbach Printing Company, Easton, Pa., at the prices attached to the proof sent

them, provided the order is received with the returned proof. The prices are also given on this page. Otherwise type is distributed as soon as the JOURNAL is printed.

Advertisements: Communications relating to advertising should be sent to the Editor. Forms close on the first of each month, and copy should be in by the fifteenth of the month preceding date of issue, to receive proof. Date of issue—the fifteenth of the month. Advertising rates sent on request.

Membership: Applications for membership in the American Pharmaceutical Association may be made of any of the officials. The annual payment of five dollars covers the annual dues and subscription to the JOURNAL. Members receive, also, the publications of the Association that are distributed free of charge.

Further information will gladly be furnished by any of the officers of the Association and members.

Cost of Reprints: Reprints will be furnished at the following prices:

SCHEDULE OF RATES FOR REPRINTS, INCLUDING POSTAGE.

HON. GEORGE W. EDMONDS

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL. VII

MAY, 1918

NO. 5

GEORGE WASHINGTON EDMONDS.

Pharmacists, while engaged in their profession, have seldom, if ever, been members of Congress, or occupied any of the higher political offices. There are, however, many who, during some period of their lives, have been actively engaged in the drug business, but to name them is not the purpose of this writing.

Congressman G. W. Edmonds, sponsor of the bill by his name, was born at Pottsville, Pa., February 22, 1864. Doubtless, the date of his birth suggested his Christian and surname. He was educated in the schools of his native city prior to his attendance at the Philadelphia College of Pharmacy, from which institution he graduated in 1886. He was engaged both in the retail and wholesale drug business as clerk for a number of years, and afterward on his own account. After about seven years of service in pharmacy he embarked in the coal business and his business interests today are in that line. So notwithstanding the fact that he is no longer active in the profession of pharmacy, his knowledge of the requirements and a deep realization that our soldiers are entitled to and need the services of pharmacy made him a willing spokesman and advocate for a Pharmaceutical Corps in the Army. We are hopeful that Congress will recognize the need of it as he does.

CONSERVATIVE CONSERVATION OF DRUGS—AN ADDENDUM.

Since the editorial on next page under above caption was written, the U. S. Food Administration has issued a bulletin announcing regulations relative to sugar purchases and sales.

Distribution under a new plan goes into effect May 15; a certificate system is provided that will virtually eliminate fictitious demands. While the restrictions were brought about primarily to assure sufficient supplies for essential foodstuffs, they were required to insure a greater supply for the Allies. Druggists will be permitted to buy sufficient sugar to meet their full requirements for medicines. Ice cream has been placed in the preferred class to encourage dairy interests to maintain their production; the use of sugar for soda fountain beverages is restricted.

CONSERVATIVE CONSERVATION OF DRUGS.

ALL the members of the American Pharmaceutical Association are willing conservators of foods as well as drugs, and differences of opinion relative to methods of conservation have no bearing whatever upon their attitude in this propaganda.

The question of conservation is related to that of supply and demand; what may have implied a saving before, now may rightfully be considered as wasteful. Lack of supply and an increased demand occasioned by war conditions have compelled enforced conservation of nearly all commodities, of service, of help, of health, in fact, it is of general, paramount importance.

As pharmacists, our problem is to conserve drugs and in that connection we are brought into coöperation or conflict with those who have great need for some of the articles necessary in the preparation of medicines, notably sugar,¹ glycerin and alcohol.

In a recent Government report it was estimated that if a saving of 25 percent of sugar was made there would be sufficient supply. Conservation should first be directed to unnecessary consumption of the article to be conserved, and it would seem that the saving indicated is possible when the large quantity of candy consumed is considered with the excessive amount of sugar dispensed in soda fountain beverages. The increased demand for confections does not date back many years. It is safe to say that candy is not an absolute necessity, therefore let those who insist on the luxury pay an advanced price and the manufacturers cut down the quantity of their production. It is essential that business be conserved as well as products.

Cane sugar is necessary for soda fountain beverages, but the syrup, as dispensed, can be diluted, and glucose added if necessary for body. It is presumed that such a syrup will more readily ferment than a concentrated sugar syrup and it may also be true that, especially if the fact is known to the patron, the beverage will not be quite as pleasing to the palate of the modern connoisseur. But these are times when everyone can afford to assume a part in conservation. The soda fountain business should not unnecessarily be interfered with; it has grown to large proportions and in many ways contributes to other industries.

¹ Frank C. Lowry, of the Federal Sugar Refining Company, estimates the present sugar balance at 3,451,572 tons. On the basis of 1917 consumption for the U. S., from now until the end of this year, 2,867,349 tons will be needed, indicating a surplus of 584,223 tons. Crop yields may fall below Mr. Lowry's estimate and more may be required by countries relying on the U. S. for supply; on the other hand, the conservation ideas, now more strongly impressed, will have a tendency to reduce the consumption of sugar.

These two lines are mentioned in connection with the conservation of sugar because of the large amount required by them and, the opportunity obtains, without great or disastrous disadvantage of conserving the greater part of the 25 percent sugar deficiency alluded to. The amount of sugar used in officials is relatively small and it seems inadvisable to seek its conservation in that connection except in so far as prescription practice is concerned. The physician can in many instances discontinue the prescribing of vehicles containing sugar.

Glycerin conservation is a matter of more serious importance or at least may become so. There is still the possibility for increasing the output but there is opportunity for eliminating glycerin from some preparations. The conserving of a quarter pound of glycerin daily in 50,000 stores and manufacturing plants would make available several tons of glycerin each day. Unfortunately we have no definite information from the Government at hand as to the amount required for its needs. However, here again it would seem that conservation should not be made by altering present formulas of the U. S. P. and N. F. except in a few instances, perhaps. Glycerin sales over the counter and in non-official preparations should be discouraged and physicians encouraged to exclude glycerin from prescriptions, unless essential thereto.

There are comparatively few preparations of the official standards wherein alcohol is not necessary; however, there are formulas of elixirs in the National Formulary that should be modified, for example, elixir of potassium acetate and lithium salicylate, even if the shortage or higher cost of alcohol did not enter. In this connection the paper by Dr. Horatio C. Wood, Jr., pp. 344-347, April issue of the JOURNAL, should be given careful consideration. Aside from such conservation, physicians should be prevailed upon to prescribe extracts instead of fluidextracts and tinctures when in their opinion advisable which can not invariably be the case.

The paper by Ambrose Hunsberger, pp. 349-353 in April number of the JOURNAL, offers most excellent suggestions and that his conclusions are well founded is voiced by the hearty approbation of quite a number of practitioners and, if the approval is given by these, there is no reasonable doubt that the same propaganda can be successfully promoted elsewhere.

So in our opinion conservation is possible without extensive disturbance of the official standards; radical changes are not advocated. There is, however, a possibility of giving recognition to some drugs that can be employed instead of those now official, and it is this thought that prompted the editorial of the January issue, p. 11.

E. G. E.

CONSERVATION OF HELP.

AS all other activities, the drug^r business is now disturbed over the matter of help. This presents a serious problem because experienced employees are required and the laws of States and Government demand that pharmacists be

qualified by training and education, notwithstanding that this fact is largely ignored when they enter Army service—a rather anomalous condition. But the situation confronts us and a discussion of the important subject is in order.

Many stores manufacture comparatively few preparations and the prescription department is unprofitable if a pharmacist must be employed. The trade of these stores is largely in merchandise that any clerk, man or woman, can sell without long training or at least without education in pharmacy. Ideas that would not be offered during normal times are permissible under present conditions; relief must be sought. Here then is one suggestion: do away with pharmacy in these stores altogether and permit such patronage to go to other stores. A number of years ago the writer proposed such plan to three druggists of a small city. As a result one of the stores assumed the pharmaceutical work and discontinued selling certain lines of merchandise. The arrangement worked well for a time, but as the present exigency did not then exist and there being changes in the firms, the plan was discontinued. Consolidation of stores or partnerships would make such arrangements practicable. Another plan is to adopt the department store idea in the larger establishments, assigning pharmaceutical duties exclusively to registered men. This will permit of employing women as clerks and conserve the number of qualified pharmacists who, of course, must also have supervision of the merchandise sales that could be construed as coming under pharmacy law regulations.

It is true that soon colleges of pharmacy will graduate their students, but many of these will immediately enter the service and so those available for positions will be rather limited in number. The colleges of pharmacy should make strong efforts to matriculate more women. It is safe to say that the question of help will become worse before the situation is materially improved. E. G. E.

THE MEDICAL DEPARTMENT OF THE U. S. ARMY SHOULD AVAIL ITSELF OF THE GREATER POSSIBILITIES OF AMERICAN PHARMACEUTICAL SERVICE.

AT the first meeting of the Philadelphia Branch, A. Ph. A., following the declaration of war, a War Aid Committee was appointed, and in May (1917) resolutions that had been adopted by the Branch were directed to President Wilson, Governor Brumbaugh, Mayor Smith and to various pharmaceutical associations. A brief outline was given of work which pharmacists could coöperate in and included these suggestions:

“Continuous display of posters; distribution of literature; interpreting to prospective recruits the different branches of the Service; enrollment of recruits; dissemination of information, orders and proclamations; fostering intensive production of foodstuffs in rural communities; receiving donations for forwarding to central distributing points; furnishing reports of disloyal conduct, suspicious actions, etc.;

control of the sale of potentially dangerous chemicals, such as chlorates, nitrates, etc."

The Committee felt safe in pledging the best efforts of every pharmacist in the United States to uphold the nation in its determination to assert American rights under any and all conditions.

A number of schools of pharmacy at once, by consent of the student body, pledged their services to the country; the American Pharmaceutical Association and its branches, as well as all other related organizations, offered their coöperation and services; the American Conference of Pharmaceutical Faculties extended the facilities of the affiliated institutions; the U. S. Pharmacopoeia Revision Committee and National Formulary Committee are at work considering conservation of articles required by the Government, and of drugs; branches of the American Pharmaceutical Association are giving much study to the subject.

We might go into detail relative to work accomplished; however, this is not the purpose. One intention is to direct attention to all the offers of the resolutions, many of which were afterward adopted by the Government, but for example, the suggestion relative to explosives was not utilized until quite recently. Surely, this is testimony that pharmacists are competent to plan and devise.

There are departments of the Government where the advice of pharmacists would have in the past saved considerable trouble, annoyance and expense. Doubtless the Medical Supply Department of the Army has profited by the advice of pharmacists, for a decided improvement is evident; the glaring errors which were shown in the official List of Staple Medical and Surgical Supplies published by the Medical Department of the U. S. Army have been corrected.

The American Medical Association, representing 80,000 physicians, is on record as favoring a properly organized pharmaceutical corps, and from opinions of medical men in various localities, in fact throughout the country, such provision for the Medical Department of the Army is strongly advocated, even though not urged to the extent of displeasing the officials. The proposal is indorsed by all pharmaceutical organizations, comprising memberships of nearly 50,000—all of them good citizens, entitled to a hearing. So many young pharmacists are now enlisted that it has produced a serious shortage of dispensers and has largely reduced the number of students in colleges of pharmacy. Some of the enlisted pharmacists have had to dispose of their stores at financial sacrifice. In all of this a patriotic spirit has been shown. But they do ask, Why is the importance of pharmaceutical service not given the recognition it deserves in the Army?

Besides clinical laboratory work, dispensing and medical aid, there are many non-medical duties that pharmacists can perform and thereby relieve the doctors to that extent which implies, that a lesser number of them will be required for the Army. It is becoming a serious question, whether a sufficient number of medical

men can be enlisted without drawing too largely from those needed at home. We refer to an abstract from the paper by Ambrose Hunsberger, printed on p. 320 of the April issue.

There is no doubt that the Army dispensary service has been improved, but there have been instances of dispensing by inexperienced men, even though pharmacists were then in the same cantonment.

European nations avail themselves of organized pharmaceutical service and have words of praise for its efficiency.

The following repeated question is relevant: "Would the Medical Department of the U. S. Army be more or less efficient with an organized corps of trained pharmacists than under the present system?" And another that we can also answer only in one way namely, "Are not soldiers, as far as possible under war conditions, entitled to the same or related attention that is deemed essential in civil life of medical practice which embraces efficient pharmaceutical service?"

The response to the efforts of the American Pharmaceutical Association for a pharmaceutical corps in past years has been "that such organization was unnecessary in peace time; " now we have war and the installation is considered inexpedient. The Irishman, in *Handy Andy*, has been quoted by a contemporary, "who did not thatch the roof of a church in fair weather because it was not necessary and could not do so while it was raining."

"It is just as reprehensible to waste talent as material. It is the property of the citizenship, and citizens are entitled to its conservation and the protection it affords." This was not said of pharmacy but it is applicable to it.

An axiom of Democracy says: "The whole people is wiser than any group or man in it. Its judgment is safer, surer." The question of the right pharmaceutical service is a broad one: it is not of an individual case or opinion but one to be asked of thousands of physicians, of tens of thousands of parents and sons, "Should the best that is in pharmacy and pharmacists be made available?"

The advice of pharmacists on matters that their training qualifies them to give should be made use of and also their services whenever necessary; to do otherwise, necessarily involves needless expenditure and avoidable inconvenience, and constitutes an injustice to the public. Why seek to assign and qualify medical men for pharmaceutical duties when they are already burdened with their own? Why are pharmacy and pharmacists of less importance in military service than in civil life? The Medical Department of the U. S. Army should avail itself of the greater possibilities of American pharmaceutical service, because our soldiers are entitled to the protection such service affords.

E. G. E.

FUNERAL OF KENNETH B. HAY, Thanksgiving Day, 1917.—One of the first sacrifices of our country to the great cause in France

Kenneth B. Hay was the son of Charles T. Hay, of Dubois, Pa., member of the A. Ph. A., until his demise in 1917. After preparing for college at Montclair, N. J., Hay entered Yale, where he remained two years. After leaving Yale, he entered the Philadelphia College of Pharmacy. He was in his second year when he enlisted with the Pennsylvania Hospital Unit, which left Philadelphia for foreign service on May 18 last.

SCIENTIFIC SECTION

RABIES (HYDROPHOBIA).*

BY E. G. STEWART, M.D.

Rabies, hydrophobia, canine madness or lyssa, is a highly infectious or communicable, rapidly fatal disease affecting practically all warm-blooded animals, especially those most commonly exposed to the bites of dogs, cats, coyotes, wolves and skunks affected with the malady. The Latin "rabies" is the best general term for the disease, in both man and animals.

Its communication from subject to subject depends upon actual inoculation, the virus or infective material being injected into the body organism through a wound made by the teeth or claws of the infected animal, chiefly the canine. Less frequently, fresh wounds, abrasions or even closely shaven surfaces which have come in contact with virulent saliva, may be the avenue of infection. Still another source of contamination is through autopsy wounds. Schroeder reported a few years ago two cases of deaths from rabies, one that of a coachman who was infected by the caresses on his face of his pet dog, that a few days later developed rabies, and the other, of a child that showed no signs of having been bitten.

As a disease entity, rabies is distinguished by its variable incubation period, one to ten months; the localization of the virus principally in the central nervous system and salivary glands with the ultimate destruction of the functioning power of the former and marked disturbance of the psychical faculties; by the short course of the developed disease and its uniformly fatal ending; by the protection afforded by inoculation with attenuated rabies virus, and by the great diversity of opinions which are still held in regard to its existence or non-existence.

There are still some individuals, including physicians, who are skeptical regarding, or even deny the existence of, rabies as a distinct disease; or, if recognizing it, they believe that the individual or animal bitten by an animal in perfect health is liable to become affected with rabies, should the offending animal develop the disease at any subsequent period, no matter how remote. To deliberately deny the existence of rabies, shows either a lack of information or is an impeachment of the sincerity and truthfulness of the men who have devoted years of disinterested study to the subject and who have presented to the scientific world, facts of observations and investigations which have proved rabies as much of a disease entity as scarlet fever, bubonic plague or smallpox. The multiplication of the living virus in the body, the communication and its mode of transmission by the affected animal to another perfectly healthy one, the multiplication of the virus and subsequent manifestation of symptoms of the disease in the second animal are procedures which have been demonstrated beyond a doubt. Every case of rabies presupposes a previous case of the disease. As to the query of the skeptic, relative to the origin of the first case, there is no answer, a mystery common to every animal and plant in the whole universe of living things, from the highest mammal to the most insignificant protozoa, from the mammoth trees to the micro-

* Read before Scientific Section, A. Ph. A., Indianapolis meeting, 1918.

organisms. "To deny the existence of rabies because we cannot trace the virus to its primary origin is to use an argument that can be applied with equal justice to show the non-existence of both dog and master and everything else living and dead. Primary, fundamental or final causes are beyond human comprehension, and those persons who require them as a basis of their beliefs, if they are consistent, must necessarily deny the existence of everything."

While rabies is not to be compared with many other infectious diseases relative to its mortality rate among human beings, it does have a definite claim for attention at the present time. It annually claims a number of victims, for, as some one has said, this "madness" is not a lunacy with life but a sanity with inevitable death; it entails untold anguish and agonies of apprehension in exposed persons and in those who have had loved ones exposed; it causes each year no inconsiderable loss economically from the death of valuable stock. And all because we refuse to make use of the comparatively simple measures which would reduce the disease to a minimum or entirely eradicate it—the enactment of proper dog laws and the muzzling of all dogs. Since the introduction of such measures the disease has been diminished in most of the German states, and the cases reported have usually come from near the border line where muzzling is not enforced. With such laws, Denmark, Sweden and Norway have not known rabies for years and it has recently been eradicated from England and Switzerland. It has never been known in Australia, probably owing to the fact that a strict enforcement of a six months' quarantine for dogs is observed.

Of all the domestic animals, the dog and cat are given the most liberty. The dog is a social animal and the cat a solitary one; domestication and association with man have not changed their inherent qualities or traits. Therefore, in the transmission of rabies, the dog is the more dangerous of the two. But when it is suggested that this roaming at large be stopped and that the dog be muzzled, a great hue and cry goes up from so-called "dog lovers," yet in reality it is no more cruel to place a muzzle on a dog than it is to put a bit in the mouth of a horse, harness him with stiff, chafing leather straps and force him to draw loaded wagons. And, in the true evaluation of things, to be a friend of man is better than to be a friend of animals, for all the discomfort of all the muzzled dogs in the world is as nothing compared to the slightest anxiety and suffering of one human being from just the fear of rabies. One must needs wonder how long public sentiment is to remain out of focus on this subject, and defeat the efforts of organized medical bodies for the prevention of disease.

Therefore, in view of existing conditions, it is well for the physician and the pharmacist and even the laity to have the salient facts of rabies in mind, because the necessity for dealing with them usually comes without much warning except in recognized epidemics of the disease, and the problems relating thereto must be met promptly.

HISTORICAL.

The earliest record of rabies is said to be found in the writings of Aristotle:

"Dogs suffer from a madness which puts them in a state of fury and all animals which they bite in this condition become also attacked by madness."

We find mention of rabies in the works of Virgil, Horace, Ovid and Plutarch. No mention of human rabies is made until the first century A. D. when Celsus described it. In the second

century, Aurelianus recorded a definite description of the disease in man practically as we know it to-day. Nothing of the disease is recorded during the middle ages. In 1591, Bauhin speaks of the infection of human beings by rabid wolves. There was an epizootic of rabies in 1604 in Paris; toward the end of the seventeenth century in Italy; in 1708 in Suabia; in 1719-23 in France and Germany; in 1754-1760 in England; in 1779-1807 in America, especially in the West Indian Islands and Peru. In 1779 there was an epidemic in Philadelphia, and in 1873 one in New York and other parts of the United States. Toward the end of the eighteenth century and the beginning of the nineteenth century rabies had spread all over Europe. Attempts have been made in the past to secure data concerning its prevalence in the United States, and the positive results at hand indicate that nearly every state in the Union has at one time or other harbored this disease in man or animals. In the Western States, the infection is frequently found in skunks or coyotes.

The early conception of the disease was held until the nineteenth century when inoculation experiments and scientific investigation revealed its true infectious character. Some of these early beliefs were naturally the results of unscientific investigation and observation, but they are worthy of consideration and repetition because they are accurate, namely, that long-haired dogs are attacked less frequently than short-haired ones, an observation explained by the fact that the infected saliva is mechanically removed by the hair; the young dogs are more susceptible; that the saliva of dogs may be virulent before symptoms have appeared; that the fear of water is seldom observed in rabid animals, the so-called "hydrophobia" being due to an intense spasm of the muscles of deglutition which interferes with the animal's satisfying his thirst. In China no corresponding word for hydrophobia is known. Mad dogs may be playful at first, they do not necessarily froth at the mouth, appear wild or carry the tail between the legs.

Various erroneous and peculiar aetiological factors were designated to account for the disease, due to the very crude methods of diagnosis and to the fact that the disease was confused with other nervous conditions, and that, because of its long incubation period, its presence in man was not associated with previous injury received from a rabid animal. It was said to be produced by "evil spirits" and to be cured by pilgrimages. Fright produced it. The disturbed relations of body gases resulting in a poisoning of the blood is another cause given. Among the Chinese, the idea is still prevalent that dogs become mad from eating toads in the spring or breathing at snake holes the poisonous vapors given off by the hibernating snakes. Frederick the Great issued an edict that the "mad worm," supposed to be the cause of rabies, but since found to be a normal cartilage of the tongue, should be removed from all dogs. Deprivation of water, extremes of temperatures, especially heat, eating putrified materials or drinking foul water, lack of a meat diet in animals accustomed to meat have all been popular beliefs. A number of years ago, the president of a S. P. C. A. of one of our large cities said that if dogs were given all the water they needed to drink, there would be no such thing as rabies.

The remedies suggested for the prevention or cure of rabies are equally interesting. In China, a dose made by pulverizing certain small insects like lice, is considered a specific emulsion. May worms given in honey is an old-time remedy. Pliny the Elder recommended the livers of mad dogs as a cure for hydrophobia. By some, it was believed that the little figures of dogs, in reality blood clots, passed in the urine of a patient after the administration of cantharides were the cause of the disease and that their elimination in this manner would result in a cure. The "mad stone" as a curative agent is still devoutly believed in by a great many people in different sections of the country. A physician from one of our Southern States reported in a medical meeting last year the occurrence of three cases of possible exposure to a rabies infection; one of these was given the Pasteur treatment, one had the wound canterized and the third had the mad stone applied. He apparently did not doubt the efficacy of any of the treatments. Some of these mad stones, properly called hair balls, are obtained from the stomachs of various wild and domestic animals. They are in some cases composed of matted hair which the animal has licked from its body and swallowed; but in the majority of cases they consist of masses of vegetable fiber which have gradually collected over a considerable period of time and formed into a spherical mass by the contraction of the gastric walls. After a person has been bitten, the mad stone is applied to the wound; if it adheres (which depends entirely upon the amount of hemorrhage) it will remove the poison, which can be detected by the discoloration produced when the stone is subsequently boiled in milk. Instances have been known where persons have made long journeys and paid large sums of money to have the mad stone applied. Celsus advised treating the bites

inflicted by dogs by suction and cauterization with the actual cautery. When the disease had developed, he recommended immersing the patient in cold water. This method of treatment persisted until the eighteenth century.

As a means of diagnosis, the bared breast of a living fowl was applied to the wound, if the fowl died it proved that the rabies poison was present, but if it lived, there was no danger to the bitten person. Another diagnostic method was to feed the exposed person some yellow or black beans. If the man found the taste pleasant and sweet and enjoyed them, he was mad, but if the taste was unpleasant, the poison of madness was not present.

In 1804 it was demonstrated by inoculation experiments by Zinke and Grüner and by Count de Salm-Reifersheid in 1813, that the saliva of a rabid dog was infective. In 1854, Virchow showed the fallacy of the spontaneous origin of the disease, and Galtier established the method of transmitting the disease to rabbits by subdural inoculation of the suspicious nerve substance. The researches of Pasteur and his co-workers demonstrated the location of the virus in its purest form in the central nervous system and gave the world protective inoculation or preventive vaccination.

Observations suggested and experiments proved that rabies was an infectious disease with symptoms referable to the nervous system, the propagation medium being the torn nerve fibers or nerve filaments at the site of the wound. The blood and lymph streams do not contain the causative agent or at least only rarely and are not usually regarded as sources of infection, but it is present in the salivary glands. Poor and Steinhardt isolated it from the salivary glands in 75 percent of all cases tested. The salivary glands in man rarely contain the microorganism. The mammary glands are occasionally invaded by the virus and milk may be a source of infection to the milker if he should happen to have cuts or bruises on his hands. Bordach records a case of a woman suffering from hydrophobia whose milk was demonstrated to contain the virus by inoculation into animals. A child she was nursing did not, however, contract the disease. Ingestion of the milk would not appear then to be a means of infection if the mucous membranes are intact, although rabbits have been inoculated successfully through the uninjured mucous membrane and one case of rabies in a nursing child has been recorded in the literature. The cerebro-spinal fluid is not infective. The skin may contain the virus at the point of inoculation, a fact which serves to emphasize the necessity of proper cauterization of the wound.

The nerve tissue of the body constitutes a perfect culture medium for the growth of the rabies microorganism, but the question of a successful artificial culture medium outside the body has not yet been settled. Noguchi reported the isolation of the rabies organism a few years ago. He states that he found, in a specially prepared culture medium, very minute granular and somewhat coarse pleomorphic chromatoid bodies which, on subsequent transplantations, reappear through many generations. By inoculating animals with cultures containing these bodies, rabies was produced in dogs, rabbits and guinea pigs as shown by the typical symptoms and further animal inoculations. His work has not as yet been confirmed by other observers. Renlinger, Poor and Steinhardt and others have demonstrated the filterability of the rabic virus. In 1903, Negri of the University of Pavia, Italy, described certain bodies which constantly occurred in certain nerve cells in cases of rabies. The relations of these bodies to the disease have been repeatedly confirmed and the demonstration of their presence in the cells of the

cornu ammonis is considered pathognomonic of the disease. Negri concluded from his studies that these bodies were probably protozoan in nature and the true causative agent. Other observers share Negri's belief, while still others are inclined to believe that they are merely cell reactions to the rabies virus. Since the discovery of the Negri bodies, it has been possible to make a laboratory diagnosis of rabies within a few hours. They are found in 96 to 98 percent of all cases of rabies that have been examined microscopically and are so permanent that their presence can be demonstrated some time after decomposition of the tissues has begun. The practical importance of their discovery apart from any ætiological relation which they may bear to the disease is obvious.

Rabies is commonly met with in mammals which are subjected oftenest to the bites of dogs, wolves, etc., but all warm-blooded animals are susceptible. The dog is most frequently affected. In Russia and in other limited areas, the wolf stands next. Cattle are often attacked by wandering rabid dogs. Cats are frequently infected, oftener than is usually suspected, because they develop the dumb form of rabies which means that no diagnosis, except of sickness, is made. Cases of human rabies are not so frequent as formerly because of the wide application of the preventive treatment.

Dogs, whether mad or not, are more active in biting during the summer months. The reason for this may be that especially during that time of the year, many street animals suffer from heat and thirst and the deprivation makes them irritable or they may be subjected to an unusual amount of teasing. These are the months, too, when people are much in the open. This is particularly true of children during the vacation months. Their chances of exposure to bites of animals are increased many-fold. One writer states that the number of applicants for treatment at a Pasteur Institute in the Northwest during the summer months far exceeds the number of persons who apply for treatment during the winter months, but that it is necessary to treat only 25 percent of such applicants since negative results for Negri bodies occur in 75 percent of animal brains examined, while in the winter, it is necessary to treat 60 percent of all applicants. In large cities, the cases of rabies in the dog are more frequent in winter than during the summer months. The idea is prevalent that animals are particularly liable to go mad during the so-called "dog days" which extend from the first of July to the middle of August. The reason these days were so designated was because they covered a period when the dog star, Sirius, was above the horizon. They have no connection or association with the dog or the presence of rabies.

The proportion of persons who, after being bitten, will develop rabies has been variously estimated. Tardieu and Bouley in France collected 855 cases, of which 399 or 46.6 percent died. According to the report of the Pasteur Institute of Kasauli, India, in 1908, 35 percent of untreated cases developed rabies. The statistics of Doebert show a mortality of 14.8 percent in 122 untreated cases; Horsley gives 16 percent; Reifer 15 percent and Högyes 15 to 16.5 percent. In the United States, there are no available statistics; Brawner followed in the newspapers such cases of bites and deaths as were reported to have occurred within the Southern States, and of 80 persons untreated except for the mad stone, there were 16 deaths reported, 20 percent. The ratio 1 to 6 would probably approximate the truth.

RABIES TABLE PERCENTAGE MORTALITY.

| Character and site of bite. | By wolf. | By cat. | By dog. |
|-----------------------------------------------------------------|----------|---------|---------|
| Multiple and deep wounds about eye, nose or lips. | 100 | 70 | 60 |
| Multiple and deep wounds about other parts of face. | 80 | 50 | 50 |
| Multiple and deep wounds on other parts of uncovered body. | 40 | 40 | 30 |
| Single and deep wounds on finger or neck. | 20 | 20 | 15 |
| Deep on well-covered parts of the body. | 15 | 10 | 3 |
| Superficial on uncovered parts of the body. | 10 | 10 | 10 |
| Same with hemorrhage. | 2 | 2 | 2 |
| Contact of recent wounds with infected saliva. | 0.1 | 0.1 | 0.1 |
| Contact of wounds more than 24 hours old. | 0 | 0 | 0 |

This gives a general average of 24 percent after dog bites.

Generally speaking, the more numerous and the deeper the wounds, the greater the danger of rabies developing. The mortality rate is higher when wounds are inflicted on bare parts, due to the fact that the saliva is wiped off when the bite is through clothing and not so much infective material enters the injured part. The nerve supply also determines susceptibility to the development of rabies. Face bites are the most dangerous. Statistics show that 90 percent of face bites are fatal. Bites on the finger tips are next in importance. The mortality from bites on the hands and wrists is 65 to 70 percent; on the arms, 30 to 35 percent; on the limbs (lower), 20 to 25 percent; and on the trunk, 5 to 10 percent.

The incubation period is variable, from ten days to many months. In human cases, the long incubation period enables the individual to avail himself of the prophylactic treatment. The length of the incubation is influenced by a number of factors, such as—the species of animal, the period being longer in man; the site of the injury, the virus travels by way of the nerve paths to the central nervous system and there is a shorter incubation period in cases where the injury sustained is near the brain or large nerve trunks, such as head and face bites; children and females have a shorter incubation, in the former this is probably due to the fact that most of the bites are about the face and hands; severity of wounds, lacerated wounds involving nerve trunks result in a shorter incubation period for they permit the introduction of a greater amount of infective material. The danger increases in direct proportion to the number of bites even though they may be slight; a weakened condition of the nervous system will determine a shorter incubation period, alcoholics and neurasthenics, syphilitics and those suffering from other nervous diseases will exhibit an earlier manifestation of the condition.

Friedberger and Frohner give the following figures for the incubation period in animals: ox, four to eight weeks; horse, four to eight weeks; cats, two to four weeks; sheep, three to four weeks; poultry, six weeks to eleven months. Bauer gives the following periods for human rabies: males, 80 days; females, 65 days; children, 57 days.

There are two clinical types of rabies in animals, the furious, due to excitation or irritation; and the dumb or paralytic, due to rapid degeneration. Many cases present a mixed type and a few are atypical. In the furious type, the most marked symptoms are the change in disposition, either in the direction of increased irritability and ugliness or unnatural playfulness and exhibition of affection; an increased hypersensibility to all external stimuli and the tendency to wander off, returning after several days, ill and emaciated and wounded from engagements

with other animals. He may have traveled a distance of from twenty to twenty-five miles. There is also a marked tendency to snap and bite, this being merely an expression of intense irritability. In some cases, he bites himself, usually at the point where he himself was bitten. The voice is changed, being hoarse and of lower pitch than usual. He does not eat the customary food but betrays an abnormal appetite for sticks, stones, etc. Swallowing becomes difficult and the irritability increases until the animal becomes furious and convulsions appear or paralysis supervenes. Death is caused by the ascent of the paralysis to the respiratory centers.

In the dumb form or the "black tongue," in the vernacular of the South, there is not the frank exhibition of rabies seen in the furious form, and for this reason, it is particularly dangerous to man. Often the most conspicuous symptom is the spasm of deglutition and the paralysis of the throat muscles giving the observer the impression that the animal has a bone in its throat, and often, the attempt on his part to relieve the animal results in exposure to the disease. The animal does not bite, but the saliva is virulent and may cause rabies if it comes in contact with recent wounds or abrasions of the skin. The animal will lie quietly in some secluded spot and appear stupid. The paralysis of the jaw is early, the tongue protrudes and becomes covered with dirt which gives rise to the expression "black tongue." Death usually occurs in about three days, whereas the furious type lasts from six to eight days; 15 to 20 percent of all cases of rabies in dogs are of the dumb type.

The premonitory symptoms of rabies in man resemble those of any infectious disease. irritability, anorexia, insomnia, depression and malaise and some stiffness of the neck and shoulder muscles. In some cases the first intimation the patient has that something is wrong is in the difficulty experienced in taking a drink. There is a constriction of the pharynx which though transitory reappears each time an attempt is made to drink. The healed wound sometimes becomes sensitive with tingling and itching or even pain. There is a moderate rise of temperature. The spasmodic stage is initiated after about twenty-four hours, and spasm result from the slightest stimuli. Mental excitement ensues and the furious stage supervenes within the next forty-eight hours or less with its maniacal delirium. The patient may die at this stage or pass into a paralytic stage in which the muscles relax, the jaw drops and the patient is comatose, the pulse irregular and the temperature high. Death occurs within five or six days and is inevitable. The delirium and mania, the violent spasms with inability to swallow are fearful to observe and physicians no matter how extensive their experience with human suffering find it difficult to erase the horror of these cases from their minds. In neurotic or debilitated subjects or in cases of multiple lacerations, the phenomena of infection are those of paralysis.

Lyssaphobia or fear of rabies is sometimes met with in neurotic individuals, but usually the symptoms, hysterical in character, come on within a few days after the assumed exposure. The occurrence of symptoms like those of rabies at a period less than two weeks after exposure should be regarded as suspicious. The first manifestation may be a hydrophobia, fear of water, and a good imitation of a dog's bark and to some extent its action, the patient going around on all fours and biting at the furniture. It is stated that hypersensitiveness to drafts of air,

which is very common and pronounced in true rabies, is not simulated in hysteria. This may be tested by stepping unobserved behind the patient and fanning him. A convulsive seizure would serve to support a diagnosis of real rabies. Usually other hysterical stigmata are present and the symptoms are amenable to treatment and the patient recovers.

Up to the present time, there has been no cure for rabies after the symptoms have once appeared. Almost every drug in the pharmacopoeia has been suggested as a possible remedy but the cures reported have never been scientifically proved. At present the developed disease must be treated symptomatically.

Preventive treatment consists, first, in the proper care of the wounds inflicted by the biting animal. Bleeding should be encouraged, as a free flow of blood will carry off some of the virus. After thorough cleansing of the wound, it should be cauterized. For this purpose, fuming nitric acid is to be preferred. Cabot in a series of experiments found that he could save 76 percent of animals when nitric acid was applied to wounds inflicted by rabid animals. Other agents used for this purpose are turpentine, hydrogen peroxide and tincture of iodine. The cautery should be applied early, not later than a half to one hour, in order for it to be effective, and it should be thoroughly applied, enlarging the wound if necessary, in order to reach the deeper parts of the wound, exercising, of course, due caution. But it must be remembered that no matter how carefully the local treatment is conducted, this does not obviate the necessity for constitutional treatment, which consists of the injection of a specific vaccine. Immunization with a living virus simulates most closely that produced in the body in overcoming an infection. In man, so far, only attenuated virus has been used. This manner of producing an artificial immunity was first demonstrated by Jenner in prophylaxis against smallpox. Pasteur recognized that Jennerization had other applications and similarly used an attenuated culture of rabies virus to establish protection against rabies.

His method was to modify "street virus" or the virus which occurs in nature, by passing it serially through monkeys and then to bring the virus up to a fixed degree of virulence by serial inoculations of rabbits giving the "fixed virus," a virus which produces the disease constantly within six to eight days after inoculation intracerebrally. Later in his work the first step was omitted and only the rabbits were used to modify and fix the virus. Proper attenuation of the spinal cords of animals dead from fixed virus inoculation was secured by drying them over potassium hydrate. The initial treatments were made with cords that had been drying a long time. Pasteur began with a fourteen-day cord and carried the treatment on for eighteen days, the later treatments being made from cords which had not been hanging over the potassium hydrate for so long a time. The Pasteur treatment depends on the fact that the spinal cord of a rabbit that has been inoculated with "fixed virus" and dead of rabies in six to eight days loses its virulence from day to day so that at the end of fourteen days it is entirely incapable of producing rabies when inoculated into a healthy animal. Beginning treatment with an emulsion of a small piece of cord that is not virulent or only slightly so, the patient is inoculated daily for eighteen to twenty-one days with varying strengths of the virus thus gradually establishing an immunity against the infec-

tion. There is involved the same principle familiar to us all in the establishment of drug toleration.

Thirty-five years ago, Pasteur established the first Pasteur Institute in Paris, and, in the July after its establishment, an Alsace child who had been severely bitten by a known mad dog was admitted for treatment. Pasteur and his associates believed that the child would die anyway and that the treatment which had been a success with animals should be given a trial at least. The inoculations were made for eighteen days and it is said that during that time, and for many weeks after, Pasteur lived in constant terror. On all sides he was severely criticized but he was confident and went ahead. The next patient treated was Julipe, a shepherd who is now a concierge at the Institute, a place which he has held practically since his treatment. The success of the method was soon assured and it was rapidly adopted in many countries, and Pasteur Institutes established. Pasteur Institutes are of two kinds, public and private. Public Pasteur Institutes are established by endowment, such as the Pasteur Institute in Paris, by governments such as those of the United States Public Health and Marine Service at Washington, the New York City Board of Health, Mexico City, and the various State Boards of Health, by universities and the Pasteur Institutes of the Universities of Moscow and Bucharest. Private Pasteur Institutes are what the name implies.

The value of the Pasteur antirabic treatment can not be overestimated. Official records have never been satisfactorily kept and mortality percentages differ but it is safe to estimate the mortality rate in untreated cases at 20 percent. The Institute in Paris was established in 1886. From that time until 1911, 32,397 patients had been treated with 128 deaths, a mortality rate of 0.39 percent. The first Pasteur Institute in the United States was opened in 1890. During the first eleven years, 1,608 persons were treated with a mortality rate of 0.68 percent. In general it may be said that the mortality of treated persons is about one percent, one-half of which could not, from the nature of their wounds, be immunized. The duration of the immunity induced by treatment is apparently variable. Experimental animals show a complete immunity even after eighteen months, but in humans there is no way of determining its duration, but it is probably much shorter than that in animals. Williams reports a case in which the immunity was less than fourteen months. Failure to establish an immunity may be due to the virulence of the infection, proximity of the wound to the nerve centers, or delay in the administration of antirabic treatment.

It is apparent that many animals (rabbits) must be sacrificed to prepare the rabies vaccine, but it is a sacrifice which is necessary to the conservation of human life and even the life of other animals. The words of Charles Eliot tersely state the creed of the scientist: "The humanity which would prevent human suffering is a deeper and truer humanity than the humanity which would save pain or death to animals."

The ill effects from the treatment are, as a rule, of minor importance. Usually during the second week of treatment there is some local reaction, such as slight swelling and tenderness at the sites of injection (the injections are made subcutaneously, the anterior wall of the abdomen by choice) lasting from twenty-four to seventy-two hours. The slight induration remaining, is absorbed slowly. Stim-

son regards this as a manifestation of hypersusceptibility to the foreign nerve tissue which is introduced.

Obese people show more local reaction than do thin people and children. In the latter, various skin rashes, which usually take the form of a mild urticaria (hives), have been observed.

The patient may complain of nervousness or sleeplessness, or, on the other hand, of drowsiness, for the first few days after institution of treatment. There is occasionally some headache or a feeling of malaise, or even slight affections of the nervous system, as restlessness, numbness and tingling of the extremities, but these are of short duration. Paralyses have occurred very infrequently with some of the older modifications of the Pasteur method as well as with the classical Pasteur, cases having been reported from all except those modifications presented by Högyes and Harris. Various explanations have been offered for the occurrence of these paralyses, but none of them is wholly satisfactory. The predisposing factors seem to be alcoholism, syphilis, and neurasthenia, according to some authorities. It must be understood that these cases of paralysis do not impair the value of the antirabic treatment any more than the deaths resulting occasionally from the administration of anesthetics, or from anaphylactic shock after the injection of diphtheria antitoxin, can be considered arguments against their use.

There are no contraindications to the institution of antirabic treatment. As stated, syphilitics, alcoholics and people affected with nervous disorders are more apt to exhibit hypersusceptibility to the injections. Pregnant women have taken the course without any disturbance, and Stimson reports a case of a boy with St. Vitus dance who seemed improved after the injections.

The brilliant results made possible by the Pasteur method have been the marvel of the scientific world and any modifications of the original method which have been devised from time to time are no criticism of the efficacy of the mother method; rather they have been efforts to so simplify the Pasteur technique that it might have a wider application. The Pasteur method requires a long time to complete the treatment and attendance at an institute necessitates considerable inconvenience and expense, and a large amount of laboratory equipment and animal material must be had for the maintenance of treatments.

There are many of these modifications. All make use of the fixed virus, but the method of cord attenuation varies for the purpose of preventing the loss of the immunizing properties, by the use of artificial gastric juice, phenol, mechanical disintegration and antirabic serum, which has been found capable of neutralizing fixed virus outside the body. Some make use of a dilution of the fresh material and all have for their ultimate purpose a shorter treatment period with a vaccine of increased antigenic (immunizing) power.

Among the best known modifications are the following:

1. The dilution of the fresh fixed virus (Högyes).
 2. Fixed virus attenuated by heat (Babes).
 3. Fixed virus attenuated by phenol (Fermi).
 4. A mixed treatment with specific serum and vaccine (Marie and Reinlinger).
- Curative effects with antirabic serum (serum of sheep which have been immunized

against rabies infection) have not been satisfactorily established, but Babes claims that it is useful in combination with the vaccine, a mixture of the two being injected in severe cases.

Among the more recent methods devised and one which has attracted a good deal of attention because of its efficacy, safety, and standardization of dosage, which is not had in the classical method, is that of Harris, of St. Louis. Dr. Harris uses both the brains and cords of animals dead from fixed virus inoculation, grinds them to a paste, freezes and pulverizes and dries *in vacuo*. The resulting fine powder has practically the same infectivity as the fresh material and can be kept indefinitely provided it is properly protected from heat, light and moisture. It is a method which bids fair to still further reduce the small percentage of failures and to lessen the proportion of injurious or untoward results of treatment.

As to the indications for institution of antirabic treatment, a few brief statements may be made. The biting animal is the best witness for the patient and the diagnostician as well as for himself. In every accident, where there is a possibility of rabies infection involved, inquiry should be made as to the circumstances under which it occurred, the actions of the offending animal and the number of persons exposed to possible infection. While a biting dog may not always be a "mad dog," he is still a suspicious character, subject to arrest, but entitled to a trial by jury. The virus is present in the saliva several days before the onset of active symptoms (two to eight days), therefore, it is very unwise to permit the animal to escape or be killed as is so often done. The only exception to this general rule would be in the case of an animal already manifesting symptoms of rabies and so diagnosed by a veterinarian, or one which is "running mad."

Remlinger gives us the most helpful outline referring to indications for antirabic treatment.

| | | |
|----------------------------|----------------------------------------------------------------|----------------------------------------|
| If the biting animal | (1) Has died within 10 days after the biting | } Anti-rabic Treatment Indicated |
| | (2) Has been killed within 10 days after the biting | |
| | (3) Has disappeared within 10 days after the biting | |
| | (4) Is unknown to the individual | } Anti-rabic Treatment Indicated |
| | (A) Becomes ill with rabies | |
| | (B) Dies with suspicious symptoms of rabies or another disease | |
| | (C) Becomes ill but does not die | } No Treatment |
| | (5) Has remained alive and under observation for ten days | |
| | (D) Remains well both during and after the period | |

ABSTRACT OF DISCUSSION.

THE CHAIRMAN: This has been an extremely interesting paper. I believe it is the first time the subject of rabies has been presented in such a brilliant and popular form.

J. N. HURTY: I wish to make a personal acknowledgment of the excellent paper which has been read by Miss Stewart and to ask only one question. Why do you believe, Doctor, that we should take with some doubt the statement "that rabies will develop after ten or eleven months of incubation?" I happen to know an instance where it developed in eleven months without doubt. It seems to me there is no doubt that it will develop within that time, but why should you doubt it? We know that the infection of tuberculosis will lie in the body for years and years and finally develop. Why not so with rabies? I would just like to know why you said that. You seemed to be quite positive about it.

DR. E. G. STEWART: I understand there are only occasional cases. I did not mean to make it so positive that there would never be any, because there might be. I have a case that developed in six months, but such cases are very rare.

JACOB DINER: I am glad to have heard Dr. Stewart bring out the point of the sympathy for dogs and the lack of sympathy for human beings. Some cities are mightily interested in seeing that the poor dogs do not suffer, so they catch them by the hundred and asphyxiate them; but they do not permit the laboratories to obtain an animal for experimental purposes. In New York they have great difficulty in getting dogs for experimental purposes, and daily hundreds of dogs are asphyxiated by the Society for the Prevention of Cruelty to Animals.

VACCINE THERAPY IN THE LIGHT OF FACTS.*

BY ALEXANDER M. ROVIN.*

Skepticism gives no impetus to the progress of science. On the contrary, it has long been recognized as an element of retrogression.

The human race has fought disease always in a spirit of optimism. This made possible what has been accomplished in conquering epidemics. Brilliant, practical and scientific discoveries in Bacteriology and Pathology have given us aid long looked for to clear up many disputed opinions concerning the control and treatment of infectious diseases.

Since the dawn of man, the human race in its struggle has endeavored to overcome many forces in nature and become master of the earth.

Intelligence is the great force in developing and cultivating man's faculties, in his adaptation of nature's forces, in overcoming diseases. Notwithstanding the many misdirected efforts of our civilization, we have made sufficient strides in general knowledge to make bacteriology, the basic science of preventative medicine, possible. By applying the discoveries made in bacteriology, the burden of disease is lightened, sickness becomes less frequent and less prolonged, a greater degree of health is secured, the efficiency of the individual and the nation is increased and life is lengthened and made more enjoyable. The eradication of bacterial infections looks more hopeful than ever, since standard bacterial suspensions have been successfully applied in the prevention and treatment of bacterial diseases. Bacterial vaccines offer the necessary stimulus in raising body resistance, preparing—so to speak—body cells (immunizing mechanism) for the adequate production of antibodies that make germ life and its destructive invasion impossible.

Antibodies are regarded as cell secreted destructive ferments and there are at least several varieties of them, *i. e.*,

- (a) Bacteriocidins, which kill bacteria.
- (b) Bacteriolysins, which dissolve bacteria.
- (c) Agglutinins, which clump bacteria and render them inactive.
- (d) Opsonins, which prepare bacteria for ingestion and digestion

by leucocytes, or so to speak, prepare them for injection by fighting cells that ingest bacteria. If the leucocytes are successful in ingesting all the bacteria, they are victorious and their victory means the overcoming of the infection. If, on the contrary, the leucocytes retreat

* Read before Scientific Section A. Ph. A., Indianapolis meeting, 1917.

or succumb in the struggle, they are destroyed by the poisons excreted or secreted by the bacteria, then the bacteria are victors in the perpetuation of the infection.

Antitoxins, which neutralize the poisonous substances produced by bacteria.

Wright demonstrated that the function of the antibodies called opsonins is to prepare bacteria for ingestion and digestion by the leucocytes. The name opsonin is from the Greek word *opsono* meaning, I prepare food for.

According to the opsonic theory of immunity, there are normally in the blood opsonins for a large variety of disease-producing bacteria. When a germ invasion takes place, tissue cells, if they are not crippled by the virulence of the organism, will immediately produce a large amount of antibodies including opsonins. In the meantime the leucocytes or phagocytic corpuscles of the blood rush to the site of invasion to repel the bacteria thus ingesting and digesting them, or in other words eating them up. This the phagocytes cannot do until the bacteria have been prepared by the opsonins.

Thus, we see that immunity to disease germs is produced in the healthy animal body by the action of the disease germs themselves which have the power of stimulating tissue cells to produce antibodies. Some of these antibodies destroy the bacteria or render them inactive and others aid the phagocytes to ingest them.

The reason such cell activities in antibody production do not always follow germ invasions, is due to the activities of the germ in the involved tissues. If the germs are very virulent, are capable of secreting active ferments which adequately digest the food on which they live, these activities of the germs have such a harmful influence on the vitality of the tissue cells that antibody formation is delayed or inhibited, thus allowing the germs to continue their ravages without hindrance, resulting in tissue destruction, pus formation or death. Antibody formation under such conditions is evidently developed at the periphery of the infected area; in tissues that are influenced by the infection but not too intensely involved. Here is where bacterial vaccines come to the rescue. By injecting organisms into healthy tissues, similar tissue cell activities for antibody production are aroused as when a germ of comparatively low virulence gains possession of the body. These antibodies then opsonize, agglutinate or otherwise influence the living organisms in the infected area and cause their destruction.

It is now well understood that many of the early failures in antibody production from the use of vaccines were due to the use of vaccines composed of but one variety of a certain species of germs, the vaccines not being polyvalent. From prophylactic and therapeutic experience we find that the immunizing power from a bacterial vaccine, composed of selected vigorous organisms of as many varieties of a given bacterial species as possible, possess higher immuno-producing properties (antigens) than single organism vaccines. Notwithstanding this clinico-scientific fact, standardized polyvalent stock vaccines have been most seriously attacked on the ground that they do not contain the precise strains which are actually present in the infection itself. It has been urged that a bacterial examination must be first made, and that then an antogenous vaccine be employed.

These objections sound plausible enough on the surface, but do not stand the test of critical analysis. The clinical results obtained by physicians show that a vaccine need not necessarily contain absolutely the same strain of streptococcus

that is present in the infection. There are real immunizing effects from different types of streptococci toward each other. Experience in the active clinical field, tends to show that even pneumococci will immunize against streptococci and vice versa. This can readily be accounted for on the ground that the pneumococcus and streptococcus are closely allied organisms and may be converted under special conditions from one to the other. The element of time in acute general infections is a far more important factor in the use of vaccines than complete identity of vaccine with infective organisms. If the clinical signs indicate the presence of a streptococcus infection, the results will be far better when a polyvalent stock streptococcus vaccine is promptly injected than when the slow, cumbersome process of taking a culture and making an autogenous vaccine is resorted to. Meanwhile, a culture for the purpose of making an autogenous one may be procured, but it will generally be found that the infection is under control by the time the autogenous vaccine is ready for administration.

It is hard, however, to understand how a great many well-meaning members of the profession do sometimes withhold the acceptance of facts dictated by the teachings of clinical experience, and cling to the opinions of ultra-scientific deductions. Facts and not opinions are the elements that make enlightened knowledge possible in the progress of applied therapeutics. Medical science is regarded as classified knowledge and recognized as such it must be arranged or so worked out that it can be applied to the best service of human society. The progress of any therapeutic agent as a remedial utility is not measured by theoretical conceptions but by its results in practical application. The contention for the advantages of any therapeutic remedy, whether presented by a professor of therapeutics in a medical college or by a humble practitioner, must be equally amenable to proof, and, dealing with vaccine therapy, it must be remembered that nearly a decade has elapsed since the use of bacterial vaccines in the treatment of infectious diseases was first begun; and it may be fairly said that any method of treatment which has passed through so long, so rigid and so thorough a probationary period must be ready for appraisal. The storm of extravagant enthusiasm with which a new remedy is apt to be greeted, has certainly passed after twelve years; there has been sufficient time to ascertain whether theoretical presumptions are borne out by practical experience; and, indeed, there must exist a great mass of actual proofs, tangible and verifiable data, clear and conclusive findings, necessary for a final judgment.

It may be said that in modern medicine no absolutely worthless remedy has had more than a brief existence in the medical armamentarium. When, therefore, a therapeutic procedure is more widely employed day by day, month by month, year by year, when it never loses but gains in appreciation, there is at least a strong presumption in favor of it. All this applies to the standardized polyvalent stock vaccines. They have obtained such support as the law of the survival of the fittest is capable of supplying.

As to the objection that standardized polyvalent stock vaccines contain species of bacteria which are not actually present in the infection, it loses its point also. Standardized polyvalent vaccines are harmless; no injurious result has ever been reported even from doses which far exceed those commonly given. Why not, therefore, give a combined polyvalent stock vaccine which will act prophylactically as well as therapeutically? Diphtheria antitoxin is given on the suspicion that

diphtheria bacillia may be present in the throat; why not, a vaccine containing the other organisms which are likely to make a habitant there? Why not a gonococcus vaccine which contains, in addition to the specific germ, those organisms which are common secondary invaders of the urethra? It is not fair to call this "shot-gun" treatment. The word "shot-gun" was coined for prescriptions which contain therapeutic incompatibilities; the standardized polyvalent vaccines, however, answer the purpose of a synergetic remedy, each constituent playing a definite therapeutic or prophylactic role.

Furthermore, careful study shows that most diseased conditions are due to a comparatively small group of organisms and most of these organisms gain entrance into the body through the mucous membranes. In the respiratory tract the most important invaders are the pneumococcus, streptococcus, staphylococcus, the micrococcus catarrhalis and Friedlander bacillus. In the digestive and urinary tract we find the colon bacillus, streptococcus, pneumococcus, gonococcus and staphylococcus. To vaccines which meet the bacteria usually found in the infections of the respiratory tract or those in the digestive or urinary tracts, the criticism of being unscientific can certainly not be fairly applied. Even in the specific infections such as whooping cough, measles, scarlet fever, influenza, gonorrhoea, etc., these ordinary pus organisms play an important role in the disease process, and for this reason the patients should receive mixed vaccines.

Theoretical preconceptions can not ultimately prevail against the facts of experience. Clinicians and physicians throughout the world are recognizing the importance of standardized polyvalent stock bacterins in medicine, and no amount of opposition can stem the tide. "Surround truth by bitter denial and contradiction," said Carlyle, "and you furnish it with the soil for its permanent growth." No better demonstration of this fact can be found than the gratifying growth of vaccine therapy—even now the subject of intense animosity.

A perusal of medical history, however, shows that every school of practical thought that brings forward new ideas must suffer animosity, suspicion and ridicule.

Polyvalent vaccine therapy, as an applied science, is evolved from all preceding stages of accomplishment and failure, and the research of many unselfish investigators who believed that it is in the actual doing and observing of things that we learn how to make profitable, logical and practical conclusions in conserving, preventing and treating the human race from the ravages of bacterial diseases.

In the words of the great Emil Von Behring "I have no fear that the thought which forms the basis of applied immunity in the prevention and treatment of infectious diseases, will ever disappear out of the practice of medicine." In fact standardized polyvalent bacterial vaccines stand as the keystone of preventative medicine, which is the triumphal arch of modern civilization.

THE POSSIBILITY OF SUBSTITUTING CANNABIS FOR OPIUM.

BY H. C. FULLER.*

The requirements of the Medical Department of our Army have caused an unusual demand for several important drugs. Among these are opium and some of the salts of the alkaloids derived therefrom. The importance of opium preparations for relieving pain is indisputable. A scarcity of the crude material exists and the importation of opium for manufacturing purposes is not sufficient to supply satisfactorily the normal legitimate consumption of the products used by the medical profession. The sudden abnormal demands for the Army have created a critical situation.

Opium for manufacturing purposes came chiefly from Turkey, but to some extent from India. Due to the fortunes of war the Turkish source is no longer available and the British authorities carefully supervise the Indian supply. The cultivation of the opium poppy in China was prohibited several years ago and while diplomatic negotiations might prevail upon the authorities to permit a resumption of the production of the drug for export it is only a possibility at present. The opium poppy will flourish in certain localities in the United States, but up to the present no recent attempts have been made to produce opium in a commercial way. To establish the cultivation of the plant and prepare a marketable drug would require considerable experimental work and it is doubtful if a material supply could be obtained during the coming year.

Opium and the salts of its alkaloids are used for the relief of pain, insomnia, inflammation and irritation, oversecretion and systemic strain. Now from a study of the physiological properties of other drugs it is possible that preparations of *Cannabis indica* might be substituted for those of opium, because Cannabis will do many of the things that opium will do. Hobart H. Hare¹ states that "Cannabis is very valuable for the relief of pain, particularly that depending on nerve disturbances; it produces sleep; that it gives great relief in paralysis agitans to quiet tremors, and in spasm of the bladder due to cystitis or nervousness; that it is used in cough mixtures, and does not constipate or depress the system as does morphine."

H. C. Wood, Jr.,² states that "*Cannabis indica* is used chiefly for the relief of pain; especially of neuralgic character, although it sometimes will palliate even pain of organic origin. It is also at times of service for quieting conditions of restlessness and general discomfort—for instance in neurasthenia—and to relieve the distress of the late stages of incurable diseases, especially advanced phthisis. More rarely it is used as a mild somnifacient."

Finley Ellingwood³ states that:

"It is a remedy for disordered mental action. It is a remedy for disorders of motility, involuntary irregular muscular movements, especially if of a distressing character. It is a remedy to arrest or control pain, often acting advantageously in conjunction with other pain-quieting agents, intensifying, modifying or favorably influencing their action. It is a remedy for excitable and irritable hyperaesthetic

* In charge, Division of Food & Drug Products, The Institute of Industrial Research, Washington, D. C.

¹ Hobart H. Hare—"Practical Therapeutics."

² H. C. Wood, Jr.,—"Pharmacology and Therapeutics."

³ Finley Ellingwood—"Materia Medica, Therapeutics & Pharmacognosy."

conditions of the genito-urinary organs, with increased functional activity and uterine disorders.

"This remedy has received a great deal of attention in its adaptability to cerebro-spinal meningitis, and with varying but encouraging results, especially in the earlier stages of irritation and congestion. It is useful also in hydrophobia, and in large doses it is certainly palliative to the distressing symptoms. Minute doses will cure some cases of tinnitus aurium.

"It is of much use in paralysis agitans, in relief of the lightning pains of locomotor ataxia, and especially in chorea and in general muscular tremblings. In chronic conditions accompanied by persistent pain, it ameliorates the pain.

"It cures many irritable states of the bladder. It is curative in strangury and painful urination with burning and scalding. In spasmodic stricture, with gelsemium or cinicifuga, it relieves quickly.

"It is soothing to irritable bronchial coughs and laryngeal spasm, and in coughs from tickling in the throat; also in whooping cough and in spasmodic coughs of whatever character. It is a common ingredient of cough syrups."

Cannabis is therefore a drug which is well established in the *Materia Medica* and its therapeutic usefulness has been demonstrated. No deaths from its use are on record, which is quite the contrast with opium.

Until recently all of our supply of Cannabis came from abroad but now it is cultivated in the United States. The drug is grown under carefully supervised conditions and its physiological activity is equal to, if not better than, the imported product. The Cannabis industry is now firmly established and sufficient quantities for extraordinary demands can be made available without difficulty.

The pharmacopoeia prescribes that the drug shall consist of the female tops, and a limit has been set on the amount of seed allowed, hence the specifications apply practically to tops which have not been fertilized by the male flowers. This necessitates the removal from the field, of the male plants as soon as the sex can be identified. It has been found that the leaves and tops of the male culs have equal or greater physiological activity than the drug from the female plants. Emphasis must be laid on the fact that this observation applies only to incompletely developed male plants, and whether or not ripe male tops would show less activity has not been determined, insofar as it applies to plants grown in this country. At the present time the important point is that the pharmacopoeia discriminates against the leaves and tops of undeveloped male culs which are just as good from a medicinal standpoint as the female tops.

While the physiological activity of the drug and its preparations will decrease to some extent after a lapse of time, permanent products can undoubtedly be evolved by a more careful study of the chemical properties of the active constituents. Little difficulty is now experienced in making permanent preparations of ergot, and the same results may be expected in the case of Cannabis. There is no reason why sterile, non-irritant, potent solutions of Cannabis analogous to Ergotin and other ergot products of the same type, should not be evolved, and be suitable for hypodermic injection, thereby rendering Cannabis an important remedy in surgical practice.

It is believed that the medical authorities might well consider seriously the possibility of using Cannabis preparations for some of the purposes for which those of opium are usually prescribed.

THE DETERIORATION OF DIGITALIS EXTRACTS.

BY HERBERT C. HAMILTON.

A recent publication on this subject by Pittenger and Mulford Jr.¹ is so revolutionary in character that while it would require a rather long series of experiments to cover the ground fully, a preliminary note on the subject seems called for because these results would lead one to infer that the tincture is practically worthless.

It is a well-known fact that digitalis has not yet been prepared in any absolutely stable form adapted to clinical use. The reason for this instability is still a matter of conjecture. Bourquelet² and Choay³ recognizing the presence of enzymes in the fresh leaves considered them to be the cause of the deterioration, because of enzyme action on the glucosides. The remedy suggested was that of exposing the crude drug before drying, to the action of strong alcohol vapors which killed the enzymes, dehydrated the drug and hastened the drying process, all of which are undoubtedly valuable but also more or less impracticable steps. That this is not the remedy, however, is demonstrated by the deterioration of the fluidextract, the tincture and the extract which have been extracted with alcohol strong enough to kill or to precipitate any enzymes present in the drug.

Some experiments in this laboratory carried over a number of years indicate that the presence of certain constituents of unknown character are largely but not entirely responsible for the observed instability. This, however, is reserved for publication later.

The object of this preliminary note is to call attention to data either already published or accumulated through years of close association with the extraction and testing of digitalis and to pave the way for a further publication of fresh data bearing directly on the point at issue, namely, whether digitalis is really as unstable as these results would indicate. If it were true that this valuable agent is so unstable, in many cases it would be practically worthless before it reaches the shelves of the druggist. This however is inconceivable since clinically the tincture is considered as valuable as any of the digitalis preparations.

Summarizing the data submitted by Pittenger and Mulford Jr., their results are shown in the following table:

| | | | |
|--------------------------------------------|---------------|--------------|--------------|
| Menstruum..... | 50% alcohol. | 50% alcohol. | 80% alcohol. |
| Character of drug..... | Not defatted. | Fat-free. | Fat-free. |
| Average loss on 5 samples in 8 months..... | 47.8% | 22.8% | 40.7% |

NOTE: These percentages of loss are based on the original assay.

From this one might conclude that a tincture is of little value unless made by extracting fat-free leaves with 50 percent alcohol, since the fat-free tincture with 80 percent alcohol is apparently no more stable than that with less alcohol. It seems improbable however, that either the higher percentage of alcohol or the absence of fats is responsible for the great loss in the third series.

Hale⁴ found the official fluidextracts, which are not fat-free, to have lost only an average of 6.6 percent in two years.

Roth⁵ observed an average loss of activity in 7 samples of fat-free tinctures of Digitalis of 14 percent in 6 months. Of this number two showed no loss while two others suffered an exceptionally high loss.

Houghton and Hamilton⁶ published the results of a series of experiments on deterioration which was summarized as follows:

LOSS OF POTENCY OF DIGITALIS PREPARATIONS WITH AGE.

| | No. sample. | Av. No. H. T. U.'s per cc. when mfg. | Years later. | Av. No. H. T. U.'s. | Av. yearly loss, %. |
|---------------------------------|----------------|-----------------------------------------|-----------------|------------------------|------------------------|
| Prep. Extract. | 11 | 260 | 5 | 160 | 8 |
| Fl. Ext. U. S. P. 7th Rev. | 8 | 72 | 6 | 55 | 4 |
| Fl. Ext. U. S. P. 8th Rev. | 11 | 55 | 3½ | 35 | 10 |
| Tincture U. S. P. 8th Rev. | 8 | 7 | 3 | 5 | 9 |

From the results in the above table and some other data not included the authors concluded:

1st. That a maximum average loss of 10 percent a year can be expected in tinctures or fluid extracts of digitalis.

2nd. That an alcoholic content of more than 50 percent in the extracting menstruum not only more completely extracts but also more nearly preserves the activity of digitalis.

This has been demonstrated so conclusively that the 9th Revision of the U. S. P. eliminates the low alcoholic menstruum and some manufacturers discarded it after only a short trial.

It seems improbable therefore that tinctures with this low alcoholic content would be uniformly found more stable than when extracted with 80 percent alcohol whether the drug was fat free or not. One cannot avoid the thought that perhaps each of the investigators quoted, obtained exceptional results due to certain unusual conditions; further, that no data either good or bad should be accepted as representing the average condition of digitalis after any particular period of aging.

Goodall⁷ summarizes some results of his as follows:

"Tincture of digitalis probably retains its full activity for one year but after that period deterioration of its potency to an important extent is likely to take place." This sounds like a reasonable conclusion, which, however, may not be verified by any single set of experiments.

The following data was obtained by my colleague, L. W. Rowe, from retests of six tinctures after an average period of six and one-half months. The tinctures were in every case extracted with 70 percent alcohol and in two cases fat-free drug was used.

These assays were carried out by the M. L. D. Frog-heart Method.⁸

SUMMARY OF ASSAYS OF TINCTURE OF DIGITALIS.
(U. S. P. MENSTRUUM.)

| Number. | Drug. | 1st test. | 2nd test. | Percent loss. | Age. |
|---------|--------------|-----------|-----------|---------------|--------|
| A | Fat-free | St'd | 90 | 10 | 8 mo. |
| B | Not defatted | 110 | 90 | 19 | 7½ mo. |
| C | Not defatted | 200 | 130 | 35 | 5½ mo. |
| D | Not defatted | 160 | 130 | 19 | 5 mo. |
| E | Fat-free | St'd | St'd | 0 | 8 mo. |
| F | Not defatted | 140 | 80 | 43 | 6 mo. |

Average loss on 6 samples—21 percent.

Average loss on fat-free samples—5 percent.

Average loss on other samples—29 percent.

The preceding data show very clearly that:

- 1st. The degree of deterioration varies with different lots.
- 2nd. The fat-free tincture made with 70 percent alcohol—two out of six samples—is apparently less subject to deterioration than that from the original drug.
- 3rd. The deterioration of tincture of digitalis is not so uniformly rapid as isolated experiments would indicate.

ESTIMATIONS OF MINUTE QUANTITIES OF EPINEPHRIN IN ANESTHETIC HYPODERMIC TABLETS.

BY TORALD SOLLMANN.

The chemical assay of such tablets is apt to be unsatisfactory, partly because of the small quantities involved, but mainly because the color-reactions of epinephrin are not always reliable in the presence of other substances.

A biologic assay is much more rapid, and possesses very fair accuracy. The most suitable quantitative method for this purpose consists in the intracutaneous injection of a dilute solution into the skin of the human forearm. The quantity of epinephrin is judged by the extent, intensity and duration of the blanching, as compared with the effects of a known solution, injected at the same time. If the solution contains an anesthetic, the quantity of epinephrin may also be judged by the duration of the anesthesia. This is a useful check on the blanching.

The solution should be very dilute. In my experiments I employed a dilution of epinephrin of 1 : 800,000. This was easily distinguishable from a dilution of 1 : 1,600,000. Other skins may do better with somewhat different concentrations. The dilutions should be made with a boiled 1 percent solution of sodium chloride.

The method of injection is simple. One or 2 Cc. are drawn into a Luer syringe, having a very fine needle. The skin of the inner surface of the forearm is cleansed with a pledget of cotton moistened with alcohol. The point of the needle is thrust *into*, not under, the skin, holding the needle at a very slight angle. Enough of the solution (about 0.2 to 0.4 Cc.) is injected to raise a wheal of about 7 mm. diameter—the exact quantity or size of the wheals is not very important, if all are made nearly alike. Three injections are made of each solution, across the arm. The next solution is then injected in the same manner, about an inch distant. The sensation is tested with a bit of cotton, twisted to a point. A sketch is made of the area of blanching. The observations are repeated at intervals first of 5 minutes, later of 10, 20 and 30 minutes, until a fair comparison is secured. It is advisable to make one of the known solutions of the same strength as the sample to be tested, and another of one-half this strength.

The injections are practically painless, but the skin may remain slightly swollen and hardened for some days.

DEPARTMENT OF PHARMACOLOGY,
MEDICAL SCHOOL, WESTERN RESERVE UNIVERSITY,
CLEVELAND.

SECTION ON EDUCATION AND LEGISLATION

PHARMACOLOGY AND THE RECOGNITION OF PROFESSIONAL PHARMACY BY THE UNITED STATES GOVERNMENT.*

BY FRANCIS EDWARD STEWART.

The failure of the Government to recognize pharmacy by providing a place for a representative on the Council of National Defense, or providing a general pharmaceutical board similar to the General Medical Board of the Council of National Defense or providing a pharmaceutical corps in the United States Army was strongly protested by the pharmaceutical and drug interests of the entire United States. The action of Professor Frederick J. Wulling, President of the American Pharmaceutical Association, in this connection is already a matter of record and is, therefore, well known to the membership of the Association. The Committee on National Defense appointed by Professor Wulling met at Washington, Wednesday, May 2, in conjunction with a similar committee appointed by the National Drug Trade Conference. Mr. Samuel L. Hilton, chairman of the A. Ph. A. Committee, presided.¹

At this meeting the National Retail Drug Association was represented by its legal counsel, Eugene C. Brokmeyer, Esq., Washington, D. C., who proposed an alignment of the entire drug interests of the United States to secure recognition by presenting a bill to Congress on the subject. This suggestion was modified and incorporated in a resolution offered by Professor James H. Beal, suggesting that a plan be adopted, placing before the Government authorities a carefully studied out prospectus showing how pharmacy and the several industries represented by the chemical and drug trade could be of service to the Government during the war, and also suggesting that a representative of the drug interests should be made a member of the Advisory Commission of the Council of National Defense. This motion was seconded and unanimously carried.

Mr. Joseph W. England, secretary of the Council of the A. Ph. A., in a letter addressed to the editor of the *Journal of the American Medical Association*, published June 16, 1917, called attention to the fact that there is no provision whatever for a pharmaceutical corps in the military organization. In the same edition of the *Journal of the A. M. A.* appeared an editorial endorsing the suggestions in regard to the establishment of a pharmaceutical corps in the United States Army. A letter was published in the *Journal of the A. M. A.* June 23rd, by Dr. S. Solis Cohen of Philadelphia, endorsing the editorial and Mr. England's letter, and suggesting that the physicians write the Medical Department of the Army in support of the movement.

The Section on Pharmacology and Therapeutics of the American Medical Association at its recent annual meeting held in New York City, passed a resolution

* Read before Section on Education and Legislation, A. Ph. A., Indianapolis meeting, 1917.

¹ Members of the A. Ph. A. Committee on National Defense: Samuel L. Hilton, Chairman, James H. Beal, J. W. England, Lewis C. Hopp, Caswell A. Mayo, Joseph P. Remington, H. H. Rusby, F. E. Stewart, Henry M. Whelpley.

in favor of establishing such corps and referred it to the House of Delegates. The House of Delegates endorsed the resolution and appointed a committee to consider the subject, of which Dr. Charles H. Mayo, president of the A. M. A., was made chairman.

President Adolph Schmidt of the Pennsylvania Pharmaceutical Association, at the last annual meeting, which was held in Pittsburgh, appointed a Committee on War Defense, of which the following is a list of the members: F. E. Stewart, Phila., Chairman; Julius A. Koch, Pittsburgh; John K. Thum, Phila.; Louis Frank, Wilkes-Barre; and Joseph W. England, Phila.

This committee was appointed in response to a resolution presented by Mr. Joseph England, offered in connection with his paper suggesting the establishment of a pharmaceutical corps in the United States Army.

The various drug interests of Philadelphia assembled at the Philadelphia College of Pharmacy, June 26th, and organized the National Pharmaceutical Service Association, with Mr. Geo. M. Beringer president and Mr. Robert P. Fischelis secretary-treasurer. The Executive Committee appointed consists of the following members of the various associations represented: J. W. England and Walter B. Smith of the Philadelphia Drug Exchange; Ambrose Hunsberger and Eugene G. Eberle of the Philadelphia Branch of the American Pharmaceutical Association; Samuel C. Henry and J. C. Peacock of the Philadelphia Association of Retail Druggists; Henry Kraemer and Robert P. Fischelis of the Philadelphia College of Pharmacy; Dr. W. D. Robinson and Mr. George M. Beringer, ex-officio. This committee is to coöperate with the Committee on War Defense of the Pennsylvania Pharmaceutical Association, of which Dr. F. E. Stewart is chairman, and is now engaged in perfecting a bill for the establishment of a pharmaceutical corps, for presentation to the United States Congress. The title of this bill is "An Act to Increase the Efficiency of the Medical Department of the United States Army, to Provide a Pharmaceutical Corps in the Department and to Improve the Status and Efficiency of the Pharmacists in the Army."

The bill presented by the National Pharmaceutical Service Association is known as the Edmonds Bill. As this bill has been published quite extensively by the pharmaceutical press, you are all familiar with its details. As you know, the bill requires that the membership of the proposed pharmaceutical corps shall consist of graduates of reputable pharmaceutical schools and shall pass a physical and mental examination of a character to insure proper fitness for the service. Also that the proposed pharmaceutical corps shall be a part of the medical corps of the Army. Such requirements place the pharmacist in position to receive a commission in the pharmaceutical corps of the Army, to be promoted to higher rank in accordance with the regulations of the Medical Corps. In the words of the bill:

Any American citizen, graduate of a reputable school of pharmacy, of good moral character and between twenty-one years and forty-five years of age, both inclusive, who can pass the usual physical examination required for appointment in the Medical Corps and the professional examination which shall include tests of skill in practical pharmacy and of proficiency in the usual subjects of a standard school of pharmacy course, may be appointed as a pharmacist in the Pharmaceutical Corps.

An original appointment as pharmacist under this Act shall entitle the appointee to the rank and commission of second lieutenant. After the expiration of the first five years of service, with honorable discharge, the pharmacist may re-enlist at any time within six months from the date

of expiration of such prior service and he may then apply for examination for promotion, and, if his physical examination and the professional examination in subjects of advanced pharmaceutical education are satisfactory he is eligible for promotion to the rank and commission as first lieutenant, Pharmaceutical Corps. After fifteen years of service in the Pharmaceutical Corps, a pharmacist with the rank of first lieutenant Pharmaceutical Corps may apply for examination for promotion. If he successfully pass the necessary examination in post-graduate pharmaceutical studies and, if, in the opinion of the Pharmacist Director such promotion is merited, he shall be promoted to the rank and commission of Captain Pharmaceutical Corps.

The remainder of the proposed Act provides the age limit, necessary physical and educational qualifications for admission to the Corps; states that pharmacist apprentices shall act as assistants to the pharmacists and to the Hospital Corps; provides the method for advancement and promotion of pharmacist-apprentices; authorizes the Secretary of War to appoint boards of three examiners to conduct professional examination described in the Act; provides for the transfer of pharmacists and druggists now ranking as master hospital sergeant, hospital sergeant, sergeant first class and sergeant, by which they may be transferred to the Pharmaceutical Corps; and also provides for as many contract pharmacists as may be necessary for emergencies, said contract pharmacists not being permitted to carry commission or right of retirement in accordance with the Army regulations.

Sections are also included in the proposed Act to fix the rank and precedents of the members of the Pharmaceutical Corps, the same to be in all respects the same as in the case of appointees to the Medical Corps of the Army. The proposed Act also provides for fixing the pay of the members of the Pharmaceutical Corps, the pay of the pharmacist apprentice to be \$33.00 per month; that of the pharmacist apprentice first class, with rank of sergeant to be \$37.00 per month; and for each re-enlistment in this service the usual increase allowed in the Army for honorable discharge and re-enlistment. No section has yet been included to fix the pay of the pharmacist director, deputy director, captain and lieutenants, except that all officers of the Pharmaceutical Corps shall receive the same pay, awards and allowances as the officers of corresponding rank and length of service in the Medical Corps of the Army, and shall be eligible to retirement in the same manner and under the same conditions.

As a member of the Committee on National Defense of the A. Ph. A., and chairman of the Committee on War Defense of the A. Ph. A., I have had occasion to confer with prominent members of the Medical Corps of the Army and Navy and find that the suggestion in regard to the establishing of a pharmaceutical corps is meeting with considerable opposition. This opposition is caused in part by the fear that the establishment of such a corps would give dignity and prestige to the nostrum business and prove of very little benefit to professional pharmacy. The cause of the opposition is also due to the belief on the part of many that the present arrangement in relation to the supply of medicinal products and pharmaceutical service is entirely adequate and satisfactory. The objection to officially recognizing pharmacy by establishing a pharmaceutical corps or by any of the other methods suggested, because that such recognition might give dignity to the nostrum business, is well worthy of the consideration of the American Pharmaceutical Association. It is to this phase of the subject that I now beg to call attention. Let us, therefore, first consider what is meant by the nostrum business.

WHAT IS MEANT BY THE NOSTRUM BUSINESS?

The name "nostrum" is derived from the Latin word, *noster*, ours, and is defined by Webster's Dictionary as "a medicine recommended by its preparer, especially a medicine the ingredients of which are kept secret by the individual or proprietor; a patent medicine; a quack medicine."

The following definition is generally accepted, even by the manufacturers of so-called proprietary medicine, as a correct description of what is meant by a "proprietary or patent medicine."

The expression "proprietary or patent medicine" shall be taken to mean and include every medicine or medicinal compound manufactured, prepared, or intended for the use of man or animal, the name, composition, or definition of which is not to be found in the United States Pharmacopoeia or National Formulary, or which does not bear the name of all of the ingredients to which the therapeutic effects claimed are attributed, and the names of all other ingredients except such as are physiologically inactive, conspicuously, clearly and legibly set forth, on the outside of each bottle, box, or package in which the said medicine or medicinal compound is held, offered for sale, sold, or given away.

According to the above definitions, much of what we are so fond of calling modern pharmacy is in fact the nostrum business, for it certainly partakes of its character. We all recognize under the name "patent medicines" the package goods placed on the market by manufacturing houses and advertised in the newspapers for self-medication, claiming to be specifics, cures or remedies for various diseases. But we have never fully realized the fact that every secret or semi-secret medicinal preparation advertised as a *specific* or *cure* for disease, practically belong to the same category, no matter whether prepared by the manufacturing houses, or retail druggists, or whether advertised in the newspapers, or in the medical journals, or whether advertised (recommended) by word of mouth by druggists to their customers. For when we test such products by the definition given by Webster, we find that they all possess the nostrum characteristics to a greater or less degree, *i. e.*, they are recommended by their preparers as medicines; they are secret or semi-secret in composition or in method of preparation; they are claimed by their manufacturers as proprietary medicines; they are claimed to be therapeutic inventions.

To the extent that nostrums are prescribed by physicians and recommended by pharmacists and pharmaceutical manufacturers, the medical and pharmaceutical professions are engaged in the nostrum business. There is no use for the pot to call the kettle black, and when the physicians condemn manufacturers and pharmacists for preparing, dispensing and advertising nostrums, they should remember that when they prescribe them they are *particeps criminis*. And when pharmacists charge physicians with violating their code of ethics by prescribing nostrums and using them for dispensing to their patients, they in turn should remember the command first to remove the beam from their own eye before attempting to remove the mote from their brother's eye.

WHAT IS MEANT BY TRUE PHARMACY?

Pharmacy, as defined by the Pharmaceutical Syllabus, published by the National Committee representing the American Pharmaceutical Association, American Congress of Pharmaceutical Faculties and the National Association of Boards of Pharmacy, is a branch of pharmacology. "Pharmacy, as a branch of pharmacology, is the science and art of preparing, preserving, compounding and

dispensing medicines." Pharmacology is defined as "The science that treats of drugs and medicines; their nature, preparation, administration and effect; including pharmacognosy, pharmacodynamics, therapy dynamics, pharmaceutical chemistry and pharmacy.

The requirements of true pharmacy demand that the source or genesis, physical, chemical, physiological and therapeutic properties, methods of preparation, standardization and proper dosage of all medicinal drugs and chemicals used for the prevention of disease and for the healing of the sick shall be published for the benefit of science and the use of the medical and pharmaceutical professions in conducting their respective vocations.

Professional requirements demand that this knowledge shall be classified in the forms of science and protected by changeless nomenclature; that the methods of manufacturing each *materia medica* product, and preparation of the same, shall be completely disclosed, and that the manufacture and sale of such article shall be open to free competition.

It is also required that the claims made for the therapeutic properties of the article shall be impartially discussed in the professional societies and press, and verified by competent observers using the same in treating the sick, and that the knowledge thus evolved shall be taught in the medical and pharmaceutical schools and colleges and embodied in scientific medical literature. By scientific medical literature is included pharmacopoeias, dispensaries, text books, monographs, and other literature dealing with *materia medica* products in a scientific manner.

Professional requirements also demand that the entire *materia medica* and its preparations shall be reduced to common standards and the same protected by law, as illustrated by the U. S. Pharmacopoeia and National Formulary, protected by the National and State pure food and drug laws, by which the U. S. Pharmacopoeia and National Formulary have been made legal standards.

It is, therefore, apparent that pharmacy and drug therapeutics are closely related and mutually dependent branches of medical science and practice; that co-operation between the medical and pharmaceutical professions is essential to the development of both, and that such coöperation can only be secured under a professional, fraternal, or coöperative system in which all concerned donate their researches and experiences to the common fund and share in the results of the co-operative work.

THE LEGITIMATE FIELD OF DOMESTIC PRACTICE.

Anyone who has the true welfare of the public at heart will not refuse to endorse the efforts of those who are endeavoring to teach the people how to live in such manner as to prevent disease. Neither would they hesitate to recommend that the public should be instructed in the use of ordinary therapeutic measures. There is, therefore, a legitimate field for domestic practice, the limits of which must be determined by the amount of knowledge possessed by the individual.

The legitimate field of domestic practice is the same as that of professional practice except that it is necessarily more limited than the field of the educated physician.

Knowledge of disease and methods of prevention and cure are still very limited even in the field of professional practice. This knowledge is not fixed but is constantly developing, so that what is accepted to-day may be rejected to-morrow for

something better because of more recent discoveries. Conditions once called diseases are now known to belong to the phenomena of resistance to disease. Cough is an example of this. When obnoxious materials, be they secretions or foreign matters, accumulate in the bronchial tubes cough is necessary for their expulsion, so that in a large proportion of cases no treatment of cough is desirable. The cough is merely an attempt on the part of the irritated mucous membranes to expel substances causing the irritation. Manifestly there are conditions in which the use of a cough remedy is undesirable.

There are two sets of cases in which cough remedies are indicated, namely, when the cough is out of all proportion to the amount of material to be expelled, or when, owing to muscular weakness and lack of irritability of the mucous membrane, the cough is not sufficient for the expelling of the secretions which gradually accumulate in the lungs, fill up the bronchial tubes, and may finally cause death by suffocation. If it were possible to give the patient a cough remedy that would instantly stop his cough, the remedy would kill the patient by permitting him to choke to death. It is evident therefore, that the treatment of cough is dependent upon three factors: First, it must be determined whether the case is one requiring a cough remedy; second, the proper cough remedy must be selected suitable to meet the condition, and third, discrimination as to dosage, frequency of repetition, time to discontinue, nature of complications that may arise (caused for example, by mixed infections), and proper care of the patient during sickness and convalescence. To the extent that the individual possesses this knowledge he is justified in treating himself or one of his family for cough. The druggist who, without this knowledge, recommends a cough medicine to a person equally as ignorant as himself, is in the position of the blind leading the blind. Proper domestic practice in such cases can only be attained when the druggist and the patron are sufficiently educated in therapeutics to make a correct diagnosis, select the right remedy and apply it in the right way.

The pharmacist is constantly called upon to supply cough remedies and information concerning them. He is supposed to be an expert in drugs, that is, expert in the knowledge of drugs and their uses, not an expert in the knowledge of diseases and their treatment. But he must acquire a certain amount of knowledge of the latter to be sufficiently proficient in the former. Unfortunately, he is not taught this knowledge in the pharmaceutical schools.

Wise public policy demands that the practice of medicine and pharmacy shall be conducted by persons who have been properly educated, trained, and licensed by boards of examiners, and that unlicensed practitioners shall not be permitted to invade the field of the physician and pharmacist. Owing to a strange anomaly of law, any person, no matter how ignorant or venal, is permitted to invade the field of the physician and pharmacist and practice both medicine and pharmacy at wholesale and without license. All that is required is the use of a sign "Manufacturing Pharmacist" or "Manufacturing Chemist" and to go into the nostrum business, limiting sales to wholesale transactions. The reason for this anomaly is, the nostrum manufacturers have been sufficiently influential to secure exemption from the medical and pharmacy laws.

What did the so-called pharmaceutical profession do to protect the public against this nostrum invasion? Unfortunately with few exceptions the pharmacists

instead of defending professional pharmaceutical practice and protecting the public from unlicensed practitioners who invaded the field, commercialized their calling and aided in converting the vocation into the nostrum business until it became practically impossible for the medical profession and the lay public and even the pharmacists themselves to recognize the difference between true pharmacy and the so-called "patent," "proprietary" or "quack" medicine business. Will someone please tell me where the line exists that separates true pharmacy from the nostrum business? Where does true pharmacy end and the nostrum business commence?

It has been truly said that the drug business differs from every other business on earth in that the druggist cannot recommend or advertise his wares without becoming a quack and a pretender. The very fact that this is true clearly shows that pharmacy cannot be practiced as a commercial business employing commercial methods of advertising, without ceasing to be pharmacy and becoming a menace to public health. It is not surprising, therefore, that the Surgeon General of the Army and his advisors regard so-called pharmacy as unworthy of recognition by the establishment of a pharmaceutical corps in the Army. The Surgeon General has doubtless conferred with his advisors on the subject and finds that physicians, sanitarians, political economists, philanthropists and the educated lay public quite generally share the opinion that much of what is now called pharmacy is nothing more nor less than the nostrum business.

We believe that the establishment of a pharmaceutical corps in the Army, the same to be conducted in the manner described in the Edmonds Bill, would not only increase the efficiency of the Medical Corps, but also exert a salutary influence on pharmaceutical practice in civil life. We believe that it would aid in separating the pharmaceutical sheep from the nostrum goats that are bleating everywhere. We believe that it would give prestige and influence to the practitioners of true pharmacy in the entire United States. We believe that it would excite interest in pharmaceutical education and thus promote the welfare of our educational institutions. We believe that it would aid in restoring the confidence of the medical profession and the public generally in drugs as remedial agents, and thus materially promote the public health. Therefore, we favor the Edmonds bill as a step toward the separation of true pharmacy from the nostrum business and restoring it to its position as a branch of medical science and practice.

MILITARY RECOGNITION OF PHARMACISTS.*

BY L. E. SAYRE.

So much has been said upon the proper recognition of the pharmacist in military service that it would seem rather rash for one to use this title for a paper at this time without some apology.

However, the importance of national service which our profession is capable of rendering in this hour of our country's need will excuse the use of over-used titles and material.

In the report of the Committee on Drug Reform, presented in this Section, the statement is made that the problem of the proper representation of the pharma-

* Read before Section on Education and Legislation, A. Ph. A., Indianapolis meeting, 1917.

cist in the Army had been squarely faced. President Wulling, it was stated, had been active in representing the Association in the investigation of this subject which, while it is very important for pharmacy as a whole, and important as being among the agencies which will stimulate and activate pharmacy's share in military service—service which pharmacy is capable of rendering—it is of little consequence in stimulating patriotism and loyalty which the profession has already shown through its noble young men. Let it be said at once, if pharmacy, in urging proper recognition, is taking advantage of an opportunity to lift itself beyond the grade it deserves, this should be denounced as a species of cupidity unworthy of our noble calling. This is a time for proving our loyalty, rather than for seeking profit by any process of appeal to our Government whose needs at this time are so desperate.

If, however, the military service of the pharmacist will be made more efficient, leaving out of consideration all other points—important as they may be considered—it is the duty of this body to see to it that the greatest efficiency of the pharmacist in national defense is made possible. If the pharmacist is discriminated against by any antagonistic influence, thus hindering the full measure of efficient service, this influence should be discovered and if possible removed, for this, in a measure we not only owe to the profession but is due to the country we wish to serve.

Notwithstanding this lack of proper recognition, the thing to do above all is to equip ourselves to perform properly the duties in the station we now occupy. If we can show a willingness to take up these duties despite discouragements we shall be in a better position to present our petition for the introduction of pure pharmacy in the various arms of the defense service.

It is gratifying indeed that the medical profession is recognizing the importance of the services of the pharmacist. In an editorial of the *Journal of the American Medical Association* of June 16, 1917, it is stated that,

"It will materially lighten the arduous duties and responsibilities of the physician to have in the army trained pharmacists who will be able to give intelligent coöperation. But it is imposing too great a strain on the patriotism of those whose special knowledge is obviously a large asset to the army, to expect them to enlist as privates without any recognition of their national worth.

"Pharmacists should be given a rank commensurate with their importance, first because it is but simple justice to the pharmacists themselves, secondly, because the usefulness of the medical corps will be greatly augmented and, lastly, and of most importance, because the efficiency of our army demands it."

The report of the Committee on Drug Reform, alluded to before, calls attention to the suggestion of Dr. A. R. L. Dohme, namely: That the six National Drug Associations constitute a Conference, through appointed delegates, to represent the drug trade on all such important questions as this. Would it not be well to have this suggestion discussed at this annual meeting. Such a plan would bring the strength of the whole body of pharmacists to bear upon all such important matters.

In connection with this matter of military recognition it is worthy of note that the Pennsylvania and the Wisconsin Associations have adopted resolutions

which are deserving of special notice. As passed by the latter association, they are as follows:¹

"WHEREAS, The public welfare at all times, especially during the war, demands that the services of both the medical and pharmaceutical profession and of all of the branches of the drug trade be fully utilized,

"WHEREAS, A medical sector has been created in the Advisory Commission of the Council of National Defense, no representation has been provided for pharmacy and no adequate representation for the drug trade; therefore, be it

"Resolved, That it is the sense of the Wisconsin Pharmaceutical Association, in thirty-seventh annual convention assembled at Milwaukee, June 25-29, 1917, that proper representation in the war administration for pharmacy and the drug trade forthwith be provided; and further,

"Resolved, That a copy of this resolution be forwarded to the Secretary of War and the Secretary of the Navy, and to all organizations working to this end."

These resolutions embody, in substance what might well emanate from this Association. Might it not be well for this Section to petition the General Session to adopt some such resolutions? If it were possible to create soon a federation of the principal drug associations as above referred to, would it not be wise for this Association to initiate this movement and petition for this federation to procure a hearing in Washington on this important matter of proper recognition of pharmacists in military service?

THE GREAT DUTY.

As we go about our daily tasks in peace and safety men are dying every minute on the battlefields of Europe to save civilization. Our own gallant soldiers are shedding their blood in France and our sailors engulfed in the waters of the Atlantic as they go in defense of America's rights and honor.

Upon our performance of the work committed to us depend the lives of thousands of men and women, the fate of many nations, the preservation of civilization and humanity itself; and the more efficient and prompt we people of America are in doing our part, the more quickly will this war come to an end and the greater the number of our soldiers and sailors who will be saved from death and suffering and the greater number of the people of other nations released from bondage and saved from death.

To work, to save, to economize, to give financial support to the Government is a duty of the nation and to the world and it is especially a duty to our fighting men who on land and sea are offering their lives for their country and their countrymen.—*The New Age*.

¹ Action was taken thereafter at the meeting in Indianapolis.

HISTORICAL SECTION

THE HISTORY OF MERCURY.*

BY OTTO RAUBENHEIMER.

Owing to the great importance of mercury in medicine, pharmacy, dentistry, chemistry and technology, its history should prove of interest to the members of the American Pharmaceutical Association, and especially those attending the sessions of the Historical Section.

The etymology of the word is worth knowing. The present Latin name *Hydrargyrum* is derived from the Greek *Hydrargyros*, which means "Water Silver" or "Liquid Silver." The English name mercury comes from the Latin *Mercurius*, the god of commerce and special patron of messengers and thieves in Roman mythology. This name was evidently given to the metal on account of its mobility and volatility.

The history of mercury dates back to old China, India and Egypt. It is said that the Chinese already used it as a remedy against syphilis. In old documents mercury is mentioned by the great Greek philosopher Aristoteles (384-322 B. C.) and by Theophrastus, the father of botany about 315 B. C. The name *Argentum Vivum*, that is, "Alive Silver" or "Quicksilver," was given to the mercury found in the liquid state. Mercury obtained from cinnabar was named *Hydrargyros* in Greek or *Hydrargyrum* in Latin by Dioscorides (about 50 A. D.), the father of the old *Materia Medica*, who in his works also points out that cinnabar was frequently confused and adulterated with minium, the red oxide of lead. The Ancients supposed that *Argentum Vivum* and *Hydrargyrum* were not alike and possessed different properties. The alchemists named the metal *Mercurius vivus* on account of its properties.

The name *Mercurius* and the association of the metal with the smallest of all major planets, the planet nearest to the sun, is first authentically mentioned in a list of metals by Stephanus of Alexandria in the 7th century. It is, however, well known that the old Babylonians connected the planets and their gods, and with them "Naba" or Mercury was the god of revelations and priestly wisdom. The star-gods were very prominent in the cultus of Babylon.

Plinius, the Roman historian, and Claudius Galenus, the Roman physician-pharmacist, speak of mercury as a poison! According to Pliny, the Romans obtained about 10,000 pounds of cinnabar every year from Almaden in Spain.

The important use of mercury of extracting gold and silver dates back to the Ancients. Pliny records in his 7th book that quicksilver is employed for separating the noble metals from earthy matter and also in gilding.

Mercury was used by the Venetians in the preparation of tin amalgam for silvering mirrors as early as the 16th century.

The Arabs inherited their medical knowledge from the Greeks, the Arabs

* Read before Section of Historical Pharmacy, A. Ph. A., Atlantic City meeting, 1916.

introduced chemicals into pharmacy and medicine, and the Arabian alchemists enriched chemistry with a great many discoveries. Among the latter, Abu-Musa-Ischafar-al-Sofi, commonly called Geber, which is the translation of his middle name (699-756), was the so-called *Magister Magistorum*. He described and used the metal mercury and was perhaps the first to recognize its valuable property to form amalgams, inasmuch as it softens gold. Geber, furthermore, was the first to prepare red precipitate and to sublime mercuric bichloride or corrosive sublimate.

In connection with the history of mercury it might be well to mention Geber's theory as to the chemical composition of metals, which found universal recognition up to the later Middle Ages. All metals consist of sulphur and mercury, which are present in different proportions and in different degrees of purity. Sulphur, on account of its combustibility, causes the alteration of metals when heated, and mercury imparts lustre, malleability, fusibility and other metallic properties.

Rhazes (850-923), the director of the Bagdad Hospital and the Galen of his time, introduced mercurial ointment and employed bichloride externally against the itch. Mesué (925-1015) used mercury in his *Emplastrum expertum ad scabiem* and in various skin diseases. Avicenna (980-1037), the greatest of all the Moorish physicians, considered corrosive sublimate as the most deadly of all poisons, but was the first to express his doubts as to the poisonous nature of the metal, having observed that it passed through the body unchanged and without any bad effects.

During the medieval period mercury became an internal remedy against worms in cattle and sheep. According to such an authority as Sprengel, Pierandrea Matthioli (1501-1577), the celebrated botanist and physician to Archduke Ferdinand and Emperor Maximilian II of Austria, was the first to administer the metal mercury internally to human beings. The internal administration of mercurials was popularized by Paracelsus (1493-1541), whose full name is Philippus Aureolus Theophrastus Paracelsus Bombastus von Hohenheim. This iconoclast (image-breaker) of medicine became the founder of iatrochemistry or medical chemistry and deserves an everlasting credit for introducing the mercurials into the materia medica as a specific against Morbus Gallicus or syphilis.

"One night with Venus and seven years with Mercury" has been the proverbial adage ever since! Paracelsus administered corrosive sublimate, red precipitate and mercuric nitrate. He also originated the process of preparing red mercuric oxide by heating the nitrate.

As a remedy for syphilis, mercury was employed in the form of fumigations, frictions, ointments and plasters. Mercurial plaster was originated by John de Vigó of Naples, physician to Pope Julius II, when during the summer of 1493 syphilis raged throughout Western Europe.

Beginning with the 15th century, attempts were made to extinguish or "kill" the mercury, that is, to finely subdivide it in preparations containing the metal. It is well acknowledged that mercury in the state of minute subdivision has distinctive physiologic effects and that the more perfectly the mercury is "killed," the more efficient is the compound.

The first mercurial pills were originated about 1540 by Barbarossa II, King of Algiers and admiral to the Turkish fleet. The formula which was sent to Francis I, King of France, contained metallic mercury, which was extinguished with the juice of roses. One of the most recent "killed" mercury preparations is gray powder or mercury with chalk, which was originated by the celebrated London syphilologist, Dr. Jonathan Hutchinson, F.R.S.

Quicksilver girdles or belts were made by the application of mercury with the white of eggs and were at one time employed in the treatment of itch.

In 1759 Prof. Braun, of St. Petersburg, was the first to solidify mercury. During that winter the thermometer registered -34° F. and when Braun placed it into a mixture of snow and nitric acid the mercury sank with great rapidity, owing to its contraction, to -352° F. When the professor took the bulb, he saw what had never been seen before, namely, solid mercury. Instead of the eternal fluid, he had before him a metallic mass, which could be hammered like lead. Since that day mercury was properly classified among the true metals.

A very important markstone in the history of mercury is the performance of Torricelli's Experiment in 1643. It remains an everlasting credit to this pupil of Galileo to determine the pressure of the atmosphere as the equivalent of 30 inches or 760 mm. of mercury. The barometer was the direct result of this experiment.

Gabriel Daniel Fahrenheit, about 1720, introduced the use of mercury in thermometers, in place of alcohol, which was employed by Galileo.

Joseph Priestley (1733-1804) was the first to use metallic mercury as a sealing agent when working with water-soluble gases.

K. W. Hempel (1819-1898), pharmacist and assistant to the great Liebig, originated the volumetric determination of mercury by titrating with Iodine Volumetric Solution.

As an example of the opposition to innovations, even in the enlightened 19th century, let me state that the first dentist who filled teeth with amalgam in New York about 1830, had to flee for his life on account of a rumor that he was poisoning his patients with mercury.

In conclusion, do not let us forget the history of mercury in our own country, which furnishes about one million pounds of mercury annually. The California mines in New Almaden, about 60 miles from San Francisco, have long been known to the Indians, who used the bright red cinnabar as a paint. The commercial value of the mines was first made known by a Mexican named Castilleró, who became the first owner, but at present the mines are in American hands. The California cinnabar yields 70 percent of mercury, while the Spanish ore yields only 30 percent.

This short account of the history of mercury does not pretend to be complete and will be followed by the History of Mercurials. The author, however, will be well repaid if it arouses more interest into that fascinating study of History of Pharmacy and Chemistry, which should be taught in every college of pharmacy, so as to inspire the younger generation with more love for their profession!

LAFITAU'S MEMOIR ON GINSENG.*

BY EDWARD KREMERS.

In 1918 it will be two hundred years that this, possibly the first printed contribution to American materia medica, was dedicated to the Duke of Orleans, Regent of France, by the Jesuit missionary who had been stationed at Sault Saint Louis, near Montreal, where he had discovered what the Indians called *garcentongen* or man-root. The discovery was not accidental but based on diligent search suggested by Father Jartoux, who had recently described the Chinese plant, the collection of which, by the Emperor's root hunters, he had witnessed in Tartary.

Lafitau's original is rare and even a reprint published in 1858 by Verreau is scarce. Hence, though the therapeutic merits of the ginseng are no longer held in the esteem shown it by the Jesuit missionary, the historic significance of the drug is such as warrants a republication of Lafitau's Memoir, together with that of the older literature of Jartoux and other missionaries and naturalists. Moreover, its historic significance in this country is not restricted to its supposed therapeutic merits, believed in by missionary as well as Indians, but is one of great economic imports to the colonies and the early United States. Suffice it to point out in this connection that the first vessel that left an American port for China after peace with the mother country had been established, was laden with a cargo of ginseng, which enabled the early citizens of the newly established United States to secure tea and silk without money, but for a root that grew wild in their forests and that was to be had in quantity for the mere collecting. Somewhat later, ginseng was one of two articles which were of sufficient value to pay wagon freight from Kentucky over the Alleghanies to the Atlantic seaports.

The republication of Lafitau's Memoir, together with other original literature on the subject, has been made possible by the Hollister Pharmaceutical Library Fund of the Wisconsin Historical Society.

THE CHICAGO VETERAN DRUGGISTS' ASSOCIATION.*

BY WILHELM BODEMANN.

Dear friends: Do not get frightened—I shall be brief! Miracles never cease! Constitutional limitations prohibit a surgeon to operate on a patient without the patient's consent, yet, on opening the A. Ph. A. JOURNAL for August, I am down for a paper on "Chicago Veteran Druggists' Association," without my consent or knowledge, or even warning. When such men as E. G. Eberle, Hugh Craig, W. B. Day, J. H. Beal, J. P. Remington, H. M. Whelpley—all valiant A. Ph. A. warriors and C. V. D. A. members—are on the field, certainly the C. V. D. A. is well represented at your historical conclave. All of these members are far superior pen slingers—certainly write more legibly and intelligently—than the writer can say for himself. But—let me say this to the A. Ph. A. Historical Section: I am disappointed, with all the appeals I have made to the A. Ph. A. Historical Section, that no city has so far followed the beacon light held out by

* Read before Section of Historical Pharmacy, A. Ph. A., Indianapolis meeting, 1917.

Chicago. The N. A. R. D. fights for the Retail Drug Trade; the A. Ph. A. fights for the allied branches and furnishes munition to all of them. We of the C. V. D. A. stand for only one thing—"Gemuethlichkeit"—"Brotherly Love," "Reminiscences" and, by our deeds and records, have shown to the world that there is something besides commerce and besides theory and practice, and that is the practice of "Love your neighbor and friend." We prohibit from discussion politics, business and religion. Aside from that we prohibit nothing, not even pure water; we don't delete other beverages, and allow everybody to do anything he wants to promote cheer and good-will.

There is not a city in the world that would not be benefited by a Veteran Association. Think for a minute what a wealth of interesting pharmaceutical lore the home cities of a Joseph Lemberger, John Patton, Joe Remington, L. E. Sayre, H. M. Whelpley, John Uri Lloyd, L. C. Hopp, McElhenie and McIntire and scores of others could draw on. Why not add the missing link—the Veteran Association—to the fame of these men? Why don't they go to it and start something? Will it pay these men? Well—let me cite my experience, if I may be permitted to do so.

My friends: I have had in my fifty years of United States pharmacy life all sorts of ups and downs, victories and defeats (and I am undecided which I enjoyed the most). I am willing to call all of that off—but leave me the C. V. D. A. To have been Recording Secretary of this most democratic as well as aristocratic body is the one thing in my career I don't care to have wiped out. We gather historical data. Our members must furnish the Archives with a photo and an autobiography—a thing which they can do far better before than after the funeral. We gather weekly at a *Tavola Rotunda*. Our Corresponding Secretary, John Blocki, decorates every member for his birthday at the weekly Roundtable. In this way we remind some men that they are born, which some claim they have forgotten. We deposit our red carnation on the bier of our departed friends—just *one*—answering the purpose better than a wash-basketful because it represents Love, Reverence, and a last "Auf Wiedersehen." Call on the officers of the C. V. D. A. for further details—if you are ready to start something in your city. Meantime, whenever you are in Chicago on a Thursday, come to our Roundtable and see. It's a case of *Veni, Vidi, Vici*. There you will see the Venerable Center of the Table, our Honorary President, dear Oliver Franklin Fuller, an inspiration and a benediction; to his left, the Chairman and the Corresponding Secretary, genial John Blocki; to his right, I confess almost in tears of joy, it has been the pride and the joy of the writer to sit for fifteen years, an inheritance I wouldn't swap for all of John D.'s best-paying oil trusts.

HISTORICAL SECTION OF THE A. PH. A.

A circular letter signed by L. E. Sayre, chairman and Hugo Kantrowitz, secretary of the Historical Section of the American Pharmaceutical Association, has been addressed to members of the Association, stating that the committee is very anxious to have this section well supported and requesting articles relating to historical pharmacy. The committee has thus far been greatly encouraged by some volunteers in helping along in this work and desires further contributions. These should be sent to Secretary Hugo Kantrowitz, 104 John St., New York City.

HOUSE OF DELEGATES, AMERICAN PHARMACEUTICAL ASSOCIATION

MINUTES OF THE FIRST SESSION.

The first session of the House of Delegates was called to order at 4.00 P.M., August 29, 1917, in Claypool Hotel, Indianapolis, Ind., by Chairman J. H. Beal, who requested the Secretary to call the roll of Delegates.

Secretary Hostmann announced that credentials had been received from twenty-five state associations and the District of Columbia as well as from forty-seven other non-voting delegate bodies. In attendance were delegates from twenty state associations and the District of Columbia as well as delegates from twenty-three non-voting members.

Chairman Beal then appointed the following committees:

Committee on Resolutions: W. C. Anderson, New York; Frank Schachleiter, Arkansas; W. G. Gregory, New York; C. M. Snow, Illinois; and H. C. Fuller, District of Columbia.

Committee on Nominations: Otto F. Claus, Missouri; John G. Godding, Massachusetts; J. A. Pool, South Dakota; Charles H. LaWall, Pennsylvania; and C. A. Dye, Ohio.

Vice-President S. C. Henry assumed the chair and Chairman J. H. Beal read his address:

ADDRESS OF THE CHAIRMAN OF THE HOUSE OF DELEGATES.

Members of the House of Delegates:

My election as Chairman of the House of Delegates last year placed me in the rather embarrassing position of being the presiding officer of a body of which I was not legally a member, and therefore ineligible to the office, and to which I am still ineligible under the new by-law approved at the last General Session of the Association at Atlantic City, restricting representation in the House to delegates of State pharmaceutical associations.

Unfortunately I was not apprised of my election to this very honorable position until the House of Delegates had adjourned beyond recall, and as there was no *ad interim* body or committee to which I could hand my resignation it has seemed to me best to hold the position in trust until your re-assembly should make possible the selection of a legal presiding officer, to whom I shall gladly turn over the honors, labors and accompanying emoluments.

Before doing so, however, I shall take the liberty of referring briefly to some of the incidents of the last annual meeting of the House and of the parent association, and to some matters collaterally related thereto.

At the second session of the House of Delegates last year Dr. H. H. Rusby, as chairman of a special committee, presented the following report:

"REPORT OF COMMITTEE TO STUDY THE PROPOSED CHANGES IN CONSTITUTION OF HOUSE OF DELEGATES.

"Your committee met this morning at 8.30 and again this afternoon. We have found so many important considerations involved in the pending resolutions that we are not willing to offer any general recommendations on the subject.

"At the same time, we have agreed upon the desirability of certain measures, which we shall recommend.

"We heartily endorse the chairman's opinion that the State associations, as such, should have a representation in this Association. Such associations do at present have the right to send delegates to this Association, who have the privileges of the floor, but the delegations, as representing their associations, do not have a vote in determining the proceedings. It seems to us very logical and consistent that the State associations, as units, should possess membership in this Association, and should so participate in the proceedings, either through the general sessions, or through those of the House of Delegates.

"We see important reasons why this should be done and we see very important benefits of such a plan, both to the State associations and to this body. We believe that there are many thousands of members of the State associations who are not members of this Association, and who for that reason take no interest in our affairs. To make their associations members of this body, with voting powers, would be the first step toward interesting them individually. It seems perfectly feasible to supply to members of State associations which are thus members of this body the publications of the A. Ph. A., for, say, \$3.00 in addition to the \$2.00 paid to their own association. We believe that the receipt of these publications would become the strongest possible incentive leading to their becoming full members. We believe, moreover, that this would go a long way toward bringing about uniformity in regard to legislation, especially affecting the prerequisite law and license laws.

"We therefore recommend that the necessary legislation should be enacted to make State pharmaceutical associations members of the House of Delegates, giving to each association represented at our meetings a single vote.

"We believe and recommend that the same action should be taken with regard to the associations of the District of Columbia and other territories, and to those of foreign States of the American continent.

"We believe that this House of Delegates should meet for the discussion of such business as may be referred to it by the A. Ph. A. and of such other affairs as they desire to discuss, previous to the meetings of this Association, and at the same time and place as the meetings of the A. C. P. F. and the N. A. B. P. in order that its discussions may be deliberate and thorough.

"We are inclined to think, though we make no specific recommendation at this time, that the following things should be done:

"1. That the local branches should not have voting powers in this House of Delegates and at the same time a representation on the Council. We direct particular attention to the fact that every member of a local branch is a member of this Association, so that these branches are not in the same need of representation as are the State associations.

"2. That local associations should not possess voting powers here. It is due the State associations that they should possess a full representation of all local associations and that it is through those State associations that they should have representation here, and not independently.

"3. That the same view should be taken of pharmacy schools, all of which, moreover, possess representation in the Section on Education and Legislation.

"4. That such national associations as the N. A. R. D., N. W. D. A., A. D. M. A., should not have voting powers, although it would be well for them to have representation in this Association. Their position is quite different from that of the other bodies already mentioned. First, they are bodies coordinate with ourselves. We are all members of the Drug Conference, where we have an equal footing. This Association has no voting powers with those bodies, and there is no good reason why they should do so in a house of delegates such as ours.

H. H. RUSBY, *Chairman*,
N. P. HANSEN,
(Signed) L. A. SELTZER,
JEANNOT HOSTMANN,
H. P. HYNSON."

The above report was adopted by unanimous vote.

At the final session of the House of Delegates Secretary Hostmann moved that the Association be recommended to adopt a new by-law as follows: "There shall be and hereby is created a House of Delegates to have and to exercise such functions as may be hereafter specified by the Association," which was carried. (JOURNAL, April 1917, pp. 362-367.)

As required by the by-laws this proposed amendment was presented and read at the second General Session of the Association, Sept. 6th, and on motion was ordered to take the usual course. (JOURNAL, Oct. 1916, pp. 1041-1042.)

The proposed amendment was also, in due course, brought before the Council and approved by that body at its adjourned session Sept. 8. (JOURNAL, Nov. 1916, p. 1283.)

The minutes of this adjourned session of the Council were read before the final General Session of the Association on Sept. 8th, and on motion, duly seconded, were by formal vote approved, so that the amendment is now constitutionally a part of the by-laws of the American Pharmaceuti-

cal Association, though it has not, so far as I have been able to discover, been included in the list of by-laws printed in the Year Book.

At the Atlantic City meeting a new by-law fixing representation in the House of Delegates was also adopted. (JOURNAL, April 1917, pp. 368-369; JOURNAL, Nov. 1916, p. 1283.)

This by-law reads: "Representation. The membership of the House of Delegates shall consist of three regularly appointed delegates from each State pharmaceutical association, from the District of Columbia Association and from similar associations in Porto Rico and the Philippines and any foreign American State.

"Delegates from all other bodies and organizations shall have the privileges of the floor but shall not have the right to vote."

As the Association has not as yet designated any new functions of the House of Delegates, it will be logical to assume that the latter still possesses all of the duties and functions that it possessed at the time the new by-law was adopted, and which will be brought to your attention presently.

The entire code of by-laws of the House of Delegates as printed in Vol. 4 of the Year Book, and which must govern our procedure until amended, is as follows:

"BY-LAWS OF THE HOUSE OF DELEGATES OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

(REVISED TO SEPTEMBER 8, 1916, INCLUSIVE.)

CHAPTER I.

"Article I. Functions. The House of Delegates shall have and exercise the following functions:

"A. To receive and consider the reports of delegates from the bodies which they represent in the House of Delegates.

"B. Consider and report upon such resolutions and upon such other subjects as may be referred to the House of Delegates by the Council or by the Association in general session, or by the various Sections.

"C. Make a final report of the business transacted by the House of Delegates to the final session of the outgoing Council at each meeting.

"D. It shall have the authority to adopt all rules and regulations necessary for the proper conduct of its business and not inconsistent with the Constitution and By-Laws of the Association and the Council.

CHAPTER II.

"Article I. Representation. The membership of the House of Delegates shall consist of three regularly appointed delegates from each State pharmaceutical association, from the District of Columbia Association, and from similar associations in Porto Rico, the Philippines and any other foreign American State.

"Delegates from all other bodies or organizations shall have the privileges of the floor but shall not have the right to vote.

"Article II. Term of Service. The elected or appointed delegates shall hold office for one year, or until the credentials of their successors shall have been approved by the Council.

CHAPTER III.

"Article I. Organization. The first session of the House of Delegates at each annual meeting shall be called to order by the Chairman, or one of the Vice-Chairmen, or the Secretary of the preceding House; or, in the absence of all of these, by the Secretary of the Council.

"Article II. Voting. Each delegate shall be entitled to one vote. No delegate shall act as proxy of another delegate who has not been seated, nor as delegate for more than one association, organization, or institution.

"Article III. Privileges. Any member of the American Pharmaceutical Association may attend any session of the House of Delegates and shall have the privilege of the floor.

CHAPTER IV.

"Article I. Officers. The officers of the House of Delegates shall consist of a Chairman, two Vice-Chairmen and a Secretary, who shall be elected annually by ballot by the House of Delegates.

"Article II. Duties of Chairman and Vice-Chairmen. The Chairman shall preside at all meetings of the House of Delegates; in his absence, or on account of inability from any cause, the First Vice-Chairman; or, in his absence, the Second Vice-Chairman; or in the absence of the three, a Chairman *pro tempore* shall perform the duties of the Chairman.

"Article III. Duties of Secretary. The Secretary shall keep fair and correct minutes of all the proceedings of the meetings and carefully preserve all reports and papers of every description received by the House of Delegates, and deliver the same to the Secretary of the Council at the annual meeting. The Secretary shall read all papers received for the purpose; shall call and record the ayes and nays whenever they are required to be called; shall notify the Chairman of every special committee of his appointment, giving a list of his colleagues, and stating the business on which the committee is to act, and shall give notice of the time and place of each meeting of the House of Delegates.

CHAPTER V.

"Article I. Sessions. The House of Delegates shall hold at least one session during the annual meeting of the Association at an hour previously determined by the Council and such additional sessions as may be necessary for the transaction of its business.

CHAPTER VI.

"Article I. The Committee on Resolutions. The Chairman shall appoint a Committee on Resolutions consisting of five members, to which shall be referred all resolutions, and which shall report to the House the results of its deliberation not later than the last session of the House.

"Article II. Special Committee. The Chairman shall appoint such special Committees as may be directed by the House.

CHAPTER VII.

"Article I. Resolutions. All resolutions shall receive a majority of affirmative votes of those present for adoption.

"Article II. Amendments. Every proposition to amend these by-laws shall be submitted in writing at one session of the House and may be balloted upon at the next session, when upon receiving the affirmative vote of three-fourths of the members present it shall become a part of the by-laws.

CHAPTER VIII.

ORDER OF BUSINESS.

"The following shall be the Order of Business:

"1. Calling Roll of Delegates whose credentials have been approved by the Council.

"2. Appointment of Committee on Resolutions.

"3. Reading of communications from the Association, Sections and Council.

"4. Calling Roll of Delegations for reports, resolutions and communications, all of which shall be in writing.

"5. Miscellaneous business.

"6. Election and Installation of Officers.

"7. Adjournment to a certain time."

It will be perceived that the House of Delegates has hitherto been required to report all of its actions and resolutions to the Council which body can not take final action thereon, but must in turn report them for approval to the Association. The House has therefore been in the form of an appendage to an appendix, which double-jointed arrangement has not been the least of grievances of which delegates have complained. Since the House is now no longer an appendage of the Council, it should be in order to change our by-laws and order of procedure that in the future our reports shall be to the parent body direct, and I shall presently offer some specific recommendations to such effect.

It will be observed from Article I, Chapter II, above quoted, that members of the House of Delegates are not required to be members of the American Pharmaceutical Association. After lengthy consideration, I have come to the conclusion that this is altogether proper. We can not hope to serve American pharmacy as it should be served if we insist that only members of the American Pharmaceutical Association can be delegates to the House of Delegates. Those who once become delegates are very likely to seek permanent affiliation by becoming members of the parent body. The chance of non-members ever being sufficiently numerous in the House to out-

number the members of the Association is so remote as hardly to be worth consideration, and besides the House must, like the Council, bow to the will of the Association, should there ever be a conflict of opinion or authority.

Moreover we have excellent examples for such lack of coincidence of membership in two bodies working together. The qualification of electors for officers of the United States is left to the determination of the individual States, and it is well known that under this rule in some States aliens can thus vote for officers of a country of which they are not citizens. We also permit non-member delegates of this Association to take part in the organization of State nominating committees, and under our old plan of election also permitted them to participate in the election of officers.

And, finally, the House of Delegates acting as such can not elect any officers or committees except its own, nor affect any other action of the Association except through argument and persuasion.

Referring once more to the functions which the House of Delegates should exercise, I have the following to suggest:

Two heavily worked bodies which already have more labor than they can properly perform are the General Sessions and the Council. In both of these the pressure of late years has increased almost to the bursting point. The Council indeed, through midnight and special sessions, manages to discharge the major portion of the work entrusted to it, but it is more than suspected that the General Sessions sometimes pay scant attention to, or even entirely neglect matters of great importance to the interests of the Association.

As a beginning, therefore, I recommend that we recommend the Association to transfer the following duties from the General Sessions and Council to the House of Delegates, beginning with this or with the next annual meeting, changes in the by-laws for this purpose to be made when necessary:

1. Transfer the reception of fraternal delegates from other pharmaceutical or allied organizations, or from departments of the United States Government, from the General Sessions to the sessions of the House of Delegates, thus leaving the first General Session of the meeting solely to the welcoming speeches by our hosts, the President's address, such special addresses as may be arranged for, to announcements which should be made at this time, and to the highly important duty of selecting and organizing the annual Nominating Committee.

2. Abolish the Committee on Resolutions provided for in Articles I and IX, Chapter X, of the Association By-Laws, which so far as I recall has never made a report, and transfer its functions to the House of Delegates.

3. Instruct the Committee on U. S. P. and N. F. to report in the first place to the House of Delegates, except upon financial matters. The national standards affect every portion of the whole country, and a body of representatives of State associations should have the opportunity of passing judgment upon them. If there are matters of special scientific interest in the reports the House will naturally refer such portions to the Section on Practical Pharmacy and Dispensing or to the Scientific Section for their consideration.

4. Make it the duty of the Committee on Patents and Trade-Marks to report to the House of Delegates instead of to the General Sessions. The questions dealt with in these reports are largely trade questions, or questions of law as related to trade, and a nationally representative body is the proper place for their presentation and discussion.

5. Transfer the reports of the Commission on Proprietary Medicines, except such portions as relate to financial questions and election of members, from the Council to the House of Delegates.

No doubt other functions appropriate to the House of Delegates will present themselves or be presented from time to time, the above being intended merely as a suggestive outline of work which might be immediately turned over to the House.

RECOMMENDATIONS FOR CHANGES IN THE BY-LAWS OF THE HOUSE OF DELEGATES.

Chapter I, Article II, add to Clause A, "and to receive the greetings of fraternal delegates to the Association from other organizations or from departments of the United States Government."

Clause B to remain unchanged.

Clause C, change the second line to read, "to the Association not later than the last General Session at each annual meeting."

Clause D to remain unchanged.

Chapter III, Article I. In the last line change "Secretary of the Council" to the "General Secretary of the Association."

Chapter IV, Article I. Change "Secretary" to "Recording Secretary."

Article III. Change the word "Secretary" to "Recording Secretary," and the words "Secretary of the Council" to the "General Secretary of the Association."

Add a new article to Chapter IV to read:

"Article IV. The General Secretary of the Association shall in January of each year send appropriate blank credentials for delegates to the various bodies entitled to representation in the House of Delegates, notify the said associations of the time when the credentials, properly filled out, shall be returned, and on or preceding the first day of the annual convention shall deliver such credentials to the Recording Secretary. All credentials received after the opening of the convention shall be handed directly to the Recording Secretary."

"The General Secretary shall cause all of the proceedings of the House of Delegates annually to be printed in the JOURNAL of the Association, and shall procure a sufficient number of reprints of the same for distribution among the members of the House of Delegates and the officers of the Association. Said reprints shall also contain the by-laws and a list of the members, officers and committees of the House of Delegates."

Chapter V, Article I, change "Council" in the third line to the "Executive Committee."

Chapter VI. Add a new article to read: "Article II. The Chairman, Vice-Chairman and Recording Secretary shall constitute an Executive Committee to pass upon the credentials of representatives to the House of Delegates, to arrange the program for the annual meeting, and to perform such other duties as are commonly discharged by executive committees, or which may be referred to them by the Association or by the House of Delegates."

This executive committee will constitute an *ad interim* body which can represent the House of Delegates whenever the President, acting as such, could not represent it. It will be the committee on credentials which can act incidentally on credentials when presented, a report of which will be ready when the first meeting of the House is called to order; so that there need be no such delay as we have had in the past.

Change the number of the present Article II to III.

Chapter VIII, line three, change the word "Council" to "Executive Committee."

Possibilities of the House of Delegates.—In reviewing the proceedings of former sessions of this body, I have been much impressed by the fact that hitherto the House has spent far more time in complaining about its alleged lack of powers or in discussing the powers it ought to have than in exercising the powers it already possessed.

As the House is now a by-law body, as is the Council, it can no longer be said to be subservient to the latter, but both are co-equal parts of the Association which has created them.

The House now has the possibilities and powers that any other organization of voluntary membership has, namely, the opportunity of discussing and formulating resolutions and policies of interest to the drug trade, and of trying subsequently through argument and persuasion to have them put into practical application.

To the eloquent words of my distinguished predecessor in this office, Dr. H. P. Hynson, concerning the necessity of a national body to represent specifically the State pharmaceutical associations I feel that I can add nothing. For years it has been the thought of many of us that there should be some organization to represent the State associations in a collective capacity, either such an organization as this present House of Delegates, or an entirely separate organization of the representatives of the State associations. Dr. Hynson has been especially persistent in his advocacy of this idea, and as far back as 1896 in an address to the Maryland Association urged that the American Pharmaceutical Association should furnish the rooftree under which such an organization could be assembled, and has since repeatedly advocated the idea both before the American Pharmaceutical Association and elsewhere. (See JOURNAL, Sept. 1916, pp. 951-954, April 1917, p. 365.)

Some have hastily assumed that the creation of the National Drug Trade Conference was the realization of Dr. Hynson's idea, but this is incorrect. The National Drug Trade Conference is composed of representatives of national organizations only, and State associations are not eligible to membership therein.

The resolution calling the constituent bodies of the National Drug Trade Conference together for the first time, was due to the immediate necessity of making some provision for the adequate representation of the drug trade for the consideration of anti-narcotic legislation then pending at Washington. This was the sole object I had in mind when I formulated that resolution, and I had no thought that such a conference would be looked upon as in any manner superseding or as rendering unnecessary an organization of State associations such as Dr. Hynson has so long and so ably contended for.

The organization of a national body representing the State pharmaceutical associations as such has now been consummated by the creation of this House of Delegates under its present by-laws: the responsibility for making it serve the high purposes for which it was brought into existence rests with you.

VICE-CHAIRMAN HENRY: Gentlemen, you have heard the very able, thorough and exhaustive address of your Chairman. Unless there is some objection, the Chair will rule that the address with its recommendations will be referred to a committee of three. Is there any objection? If not, the Chair will appoint as such a committee, Charles H. LaWall, S. L. Hilton and O. F. Claus.

There is just one other matter that I should think should be cleared up in regard to this address. That is the recommendations for changes in the by-laws, and unless there is objection I will rule that the reading of these recommendations by the Chairman shall also constitute the first reading of the proposed changes. Therefore, the matter will be open for final action at the session tomorrow. If there is no objection that ruling will stand.

(Chairman J. H. Beal resumed the chair.)

THE CHAIRMAN: Now, as I confessed at the beginning of my paper, I am not legally your presiding officer, so it will be in order for you to provide for a chairman *pro tem* who can legally preside.

C. H. LAWALL: I will nominate as chairman *pro tem* James H. Beal.

THE CHAIRMAN: I am not a delegate.

VICE-CHAIRMAN HENRY: Mr. Chairman, as I understand it, this matter—the point that you have raised—will be finally determined when this body reorganizes; in other words, when your successor is elected, and it seems to me it is perfectly proper for the Chairman to continue to serve until that point in the program is reached. I raise the point of order.

THE CHAIRMAN: The Vice-President raises the point of order that the old House of Delegates remain as such until it has been replaced by the organization of the new House of Delegates. Under the circumstances I do not like to decide that, so I will put it to a vote. As many as favor sustaining the point of order made by the Vice-President will vote aye, opposed no.

(The question was put and carried.)

THE CHAIRMAN: The next order of business is the report of the Secretary. It follows:

REPORT OF THE SECRETARY OF THE HOUSE OF DELEGATES.

Once again your Secretary must hark back to the same old question "Why a House of Delegates?" Has the change wrought at Atlantic City limiting representation in the House to State and territorial pharmaceutical associations brought forward any advancement? Has the usefulness of the House been increased or decreased?

I feel safe in stating that no one who has studied the question will deny that the idea of having a permanent active central body representing all the State and territorial associations in the country is one full of potential possibilities.

We have our A. Ph. A. and the N. A. R. D., both doing excellent work either individually or through representation in the Drug Trade Conference. I think you will agree that the sum total of pharmacists attending the annual sessions of the State units is much larger than is that ever in attendance at the meetings of the two national bodies mentioned above. But, you will say, the members who can not or do not attend receive all transactions and "goings on" of the meetings in the publications of their respective associations. True, indeed, but many of us, yes,

by far too many, know that a very large number of pharmacists will not read these reports of the meetings although they are of vital interest to their welfare.

Therefore, if it were possible, and I can see no reason why it should not be, to get together at least once a year representatives of all State and territorial pharmaceutical associations and have these delegates report back to their associations the matters that were discussed in annual session, a great step forward would have been taken.

Of course, there are lots of things that must be done before such a conclave might bring forth any direct and tangible results, but personally I feel that in view of the great possibilities the idea suggests that enough workers can be found in our ranks who will take up with the proper spirit and enthusiasm the preliminary work needed to bring about the desired result.

Some will say the idea is good, but the execution is bad. Such a federation to be of any value should be an entirely separate and distinct body without any affiliation whatever with the A. Ph. A. Perhaps this is true. If it is, the work that the House as at present constituted may and can do and ought to do, should show this and if whatever we may accomplish in the House within the next two or three years should blaze the way for the organization of a successful live central federation of State associations, then I claim that that would be but another valuable achievement added to the many the A. Ph. A. now has to its credit.

Representation in the House being limited to associations having many members not members of the A. Ph. A. brings about a more or less chaotic condition which may be remedied temporarily by asking these bodies to send only such delegates as are members of the A. Ph. A.

Of course, there is another way that this can be remedied—make them all join the A. Ph. A.! This brings up the point that as a delegate body the House has only a fly-by-night existence and as the organizations sending delegates are not members, the only way to obtain permanent existence is to make the State associations members of the A. Ph. A. Can this be done? If so, HOW? This is a big question which means a great deal to the A. Ph. A. and should again be taken up.

If we can but interest the delegates and have them create discussion at the State meetings of the happenings at the A. Ph. A. meetings then we, by creating a closer bond between the A. Ph. A. and the other associations are performing an act which perforce must rebound to the benefit of organized pharmacy and everything connected with it.

It is by no means an easy matter to arrange a program for a meeting such as we are attending at this time. Many of the delegates are appointed only a short time before the scheduled time of meeting. It is difficult to know what delegates will be in attendance. If this body were properly organized and the delegations in attendance had been instructed by the bodies they are accredited to, as to introduction of resolutions, etc., after these matters had been duly discussed by their respective associations then something could and would be accomplished.

If the officers of the House acted as a sort of a committee on scope or program and after drawing up a tentative list of important subjects considered worthy of discussion submitted this list to the officers and chairmen of the proper committees of all the State associations many of these bodies would take action and send instructed delegations ready to do real hard work of lasting benefit.

Functions of the House:—Your Chairman in his address has made several recommendations that I am sure you will carefully consider. I would like to ask the members to listen to one more suggestion. Could not the multiplication of Section meetings be somewhat reduced by abolishing the "Section on Education and Legislation?" Many of the matters discussed by this section should be taken care of by the A. C. P. F. and the N. A. B. P., the balance by a properly organized and well-running House of Delegates.

(Signed)

JEANNOT HOSTMANN

THE CHAIRMAN: You have heard the report of the Secretary, what is your pleasure?

W. C. ANDERSON: Does the report carry with it any recommendations?

SECRETARY HOSTMANN: Only a suggestion.

(Upon motion the report was accepted.)

THE CHAIRMAN: Are any committees ready to report or resolutions to be presented?

Secretary Hostmann read resolutions.

(See report of Committee on Resolutions.)

COMMUNICATION OF SPECIAL COMMITTEE OF NATIONAL DRUG TRADE CONFERENCE.

To the President and Members of the American Pharmaceutical Association:

Gentlemen:—

The National Drug Trade Conference has been in existence since 1912, when pursuant to a resolution passed by the A. Ph. A. at its annual meeting it came into being at the New Willard Hotel at Washington, where it has been holding its annual and special meetings ever since. Its purpose at its birth was to be a clearinghouse of opinion and suggestion of all the several National Associations connected with the drug trade, to wit:

American Pharmaceutical Association, American Drug Manufacturers Association, Association of Pharmaceutical Chemists, National Association of Retail Druggists, National Wholesale Druggists Association, Proprietary Association of America.

Up to this time its work has been practically centered upon and limited to the Harrison Anti-Narcotic Law, the passage of which by the Congress of the U. S. A. was its work. If it never did another stroke of work its creation and perpetuation to this time would be much more than justified by that splendid piece of constructive work. It will be many a day before another piece of legislative work as valuable and successful will be done by the National Drug Trade Conference or any other drug association. The saving of human life and above all of human usefulness and efficiency by this law can not in my humble judgment be estimated. Suffice it to say that every day, from the day of its passage on, it has saved and conserved lives of human beings in this country and the number thus saved is increasing daily. Most of us know the untold and unreckonable misery whisky has done to the human race, although probably none of us know the real sum of wrecked lives and unmarked graves that can be accredited to John Barleycorn. Few if any of us, however, have the remotest conception of the extent of the wrecked homes, shattered systems and rotted moral fiber that owe their existence to the abuse of narcotic drugs. It transcends compilation because it is so insidious and hidden that most of it does not see the light of day. In any gathering of men and women anywhere there are an appreciable percentage of narcotic addicts. Brothers do not know that their own sisters are such and parents caress many a child that within the space of an hour thereafter is jabbing the hypodermic, or "shotgun" of the initiated, into his or her body somewhere. No class is exempt, no calling too exalted. It permeates every realm of society and all professions and trades. Wherever it strikes, the moral fiber begins to rot and self-respect prepares to fly out of the window. So much to the credit of the National Drug Trade Conference, and please chalk up that credit in bold letters.

It is known to all the delegates that constitute this Conference that it possesses no real power to do anything. New and splendid things that are to be done by it, knock at the door and after being debated and discussed are of necessity shelved, because each set of delegates can by the by-laws of the Conference only refer any conclusions reached back to their National Association for action. Hence practically all of the time since the passage of the Harrison law has been of the nature of mutual felicitation, friendly debate and practice in parliamentary rule.

Legislation is going on in increased degree and severity every year. Reform legislation, much of it extreme and impractical and almost all of it more or less crack-brained, seems to be the order of the day in halls of legislation. Formula exposure laws, laws requiring registration and payment of charges for each such registration of every medicinal product sold in a State, etc., etc., crop up regularly at State legislatures in forty-eight States. Each branch of the trade and each association, both State and national, endeavors to handle the situation by its own methods and with its own arguments. Some of the latter flatly contradict each other. Few of them carry enough weight to influence legislation and impress legislators. It seems to the National Drug Trade Conference that organized effort is needed to successfully cope with the future problem of preventing bad and creating good legislation bearing upon and affecting the Drug Trade. Can not such organization be effected by having each national association concerned with the drug trade and represented by the six national associations constituting the N. D. T. C., authorize its delegation to that conference to act for it at meetings of the N. D. T. C.? Your legislative committee has power to act in legislative matters and does act, and is thus enabled to accomplish something. Could you not appoint three members of your legislative committee to act as your

delegates to the N. D. T. C., and give them the power to act at its meetings, without having to wait a year perhaps for your annual meeting, and probably thereby lose the opportunity to prevent the passage of some bad law at a legislative session of some State? In cases of new legislation inaugurated by the N. D. T. C., as for instance the Harrison law, we can wait for a year or so for your confirmation, but in cases of laws proposed by legislatures you have no such time to wait and you must act while the legislature is in session or it is too late. It required over two years for the N. D. T. C. to secure the passage of the Harrison law, because the N. D. T. C. had to refer its decisions and acts back to the national associations for confirmation. If the Conference had had the power to act the law would doubtless have been passed much earlier and easier.

Representing the committee appointed by the N. D. T. C. on the subject of powers of its delegates to act upon matters pertaining to drug legislation in State and nation, I am instructed to lay the question before you for your consideration and decision. In other words, permit me to present for your consideration and action the following resolutions:

WHEREAS, in matters pertaining to legislation that affects the drug trade of this country it is desirable that there be organized effort in order to successfully combat undesirable drug legislation and have enacted desirable drug legislation, and

WHEREAS, such organized effort can best be secured through the National Drug Trade Conference representing all branches of the drug trade, and by authorizing our delegates to that Conference to act according to their best judgment when the question of definite action comes up for vote at the meetings of the National Drug Trade Conference,

Now therefore be it

Resolved, that the American Pharmaceutical Association hereby empowers its delegates to the N. D. T. C. to vote upon any and all matters pertaining to drug legislation in State and nation when these come up for decision and action at the meetings of the N. D. T. C.; that such vote be in conformity with the will of this Association when such will has been expressed and in all cases, where action must be taken before this Association can consider the matter, the vote be in conformity with the best judgment of the delegates.

Resolved, that the Legislative Committee of this Association, with the approval of the President, be hereby instructed to elect from among its members or from among the members of this Association the delegates of this Association to the National Drug Trade Conference.

It seems, in conclusion, to me that of all activities of this Association in which there is needed organized effort and cooperation, those activities that pertain to legislation in State and nation affecting us as they do most vitally, require it the most and receive it the least.

If for instance the State of Indiana, which I understand is about to go bone dry, should find it necessary in the opinion of the advocates of prohibition to pass a law preventing the manufacture in or importation of ethyl alcohol in any form into the State, its drug trade would require nationwide help and prompt help to prevent its passage if they hoped to save their drug interests from being compelled to leave Indiana, and Indiana's people from securing the needed medicines that alcohol can only produce in its qualities as a solvent and preservative. The N. D. T. C. legislative committee representing as it would all the drug trade interests of the land would be enabled to take prompt action and bring to bear upon the Indiana legislative influences from every State in the United States of every drug trade interest in the United States. As it is constituted now it could do no more than to express on paper its conviction that the proposed law should be killed. It could not act in the living present and come to Indiana's aid promptly; because that conviction lacks the authority and power to express itself to anyone save the debating society in which it originated.

Very respectfully submitted,

A. R. L. DOHME, *Chairman*.

It was moved that the resolutions contained in the communication from the National Drug Trade Conference be referred to the Committee on Resolutions. Charles M. Woodruff discussed the communication and spoke of the activities of the conference from which it emanated. It was then put to vote and referred in accordance with the motion.

(The first session of the House of Delegates was then adjourned.)

MINUTES OF THE SECOND SESSION.

The second session of the House of Delegates was convened by Chairman J. H. Beal at 4.00 P.M., August 30, 1917.

The minutes of the first session were read and approved.

Vice-Chairman Otto F. Claus assumed the Chair while Chairman J. H. Beal read the report of the Commission on Proprietary Medicines. (See JOURNAL, January 1918, p. 67.)

On motion of W. C. Anderson and a second, the report was received and approved.—Carried.

Chairman Beal stated that the members of the Commission sought advice and suggestions and invited discussion.

(E. G. Eberle brought word that the General Session was considering the report of the Committee on Time and Place and asked for a vote from members in attendance of the House of Delegates. The vote was unanimous for Chicago.)

The Committee on Address of Chairman J. H. Beal reported as follows:

REPORT OF COMMITTEE ON CHAIRMAN'S ADDRESS.

Your committee appointed to consider the address of Chairman Beal have accepted the responsibility and have carefully considered the comprehensive review of the work of this body together with the valuable and timely suggestions for enlarging the scope of its work and making it a valuable constructive factor in the American Pharmaceutical Association.

These facts and recommendations have been so logically and convincingly set forth that your committee's labors have been thereby lightened and the way of decision made easy.

There are five main or principal recommendations in addition to the suggestions for changes in the by-laws which have already been partly acted upon. These we report upon as follows:

No. 1.—The transferring of the reception of fraternal delegates from other bodies from the General Sessions to the House of Delegates.—APPROVED.

No. 2.—The abolishment of the Committee on Resolutions of the A. Ph. A. and the transference of its functions to the House of Delegates.—APPROVED.

No. 3.—The provision for the presentation of reports of the Committees on U. S. P. and N. F. to the House of Delegates except as to financial matters and appointments and the subsequent reference of matters of special interest in these reports to the sections where they properly belong.—APPROVED.

No. 4.—The provision for the presentation of the Report of the Committee on Patents and Trade Marks to the House of Delegates as being a properly representative body especially favorable for this purpose.—APPROVED.

No. 5.—The provision for the transference of the report of the Committee on Proprietary Medicines, except as to financial matters, and election of members, from the Council to the House of Delegates.—APPROVED.

We also approve of all of the recommendations for changes in the by-laws made necessary in order to harmonize them with these new and increased activities of the House of Delegates and urge the final adoption of these changes at the session at which this report is read.

In concurring with all of these recommendations your committee believes that the benefit to be derived by simultaneously lightening the burden of details now considered by the A. Ph. A. and increasing the responsibilities and activities of the House of Delegates, will be made manifest at next year's meeting of the Association and that such changes are in the line harmonizing fully with the aims of President Wulling to build up a strong federation of all allied interests in the body pharmaceutic.

Respectfully submitted

CHARLES H. LAWALL, *Chairman*,
S. L. HILTON,
OTTO F. CLAUS.

(The report was accepted and approved after voting on motion of Harry B. Mason and a second.)

Chairman W. C. Anderson of the Committee on Resolutions reported for that committee as follows:

Approval of the following resolutions:

WHEREAS, the public welfare at all times, especially during the war, demands that the services of both the medical and pharmaceutical professions and of all the branches of the drug trade be fully utilized, and

WHEREAS, a medical sector has been created in the advisory commission of the Council of National Defense and no representation has been provided for pharmacy and no adequate representation for the drug trade, therefore be it

Resolved, that it is the sense of the American Pharmaceutical Association in annual convention assembled, that proper representation in the war administration for pharmacy and the drug trade be provided, and be it furthermore

Resolved, that a copy of these resolutions be forwarded to the Secretary of War and the Secretary of the Navy.

(The House on vote concurred.)

Relative to the next resolution, the Committee reported to have the work assigned to the Executive Committee, to be provided instead of the creation of a special committee. The House voted to adopt the recommendation of the Committee on Resolutions. It follows:

That a committee consisting of three members of this House of Delegates and the Chairman-elect and Secretary-elect be appointed by the Chairman. It shall be the duty of this committee to submit to the proper officers of all State and territorial associations a tentative list of subjects of national importance with an abstract of such discussion on action as may have been taken thereon with the request that such resolved matters be duly considered and such action as the Association may desire brought before the American Pharmaceutical Association through its representatives in the House of Delegates.

The first of the resolutions following was favorably presented by the Committee and approved by the House. The second resolution was disapproved concurring with the recommendations of the Committee. The resolution relative to patents and trademarks was discussed at length; the Committee presented a majority, and minority report thereon, the majority favored the adoption of the resolution, but the House decided adversely. The three resolutions follow:

Resolved, that the American Pharmaceutical Association hereby empowers its delegates to the N. D. T. C. to vote upon any and all matters pertaining to drug legislation in State and nation when these come up for decision and action at the meetings of the N. D. T. C.; that such vote be in conformity with the will of this Association when such will has been expressed and in all cases, where action must be taken before this Association can consider the matter, the vote be in conformity with the best judgment of the delegates.

Resolved, that the Legislative Committee of this Association, with the approval of the President, be hereby instructed to elect from among its members or from among the members of this Association the delegates of this Association to the National Drug Trade Conference.

Resolved, that the American Pharmaceutical Association appeal to Congress asking that all patents and trade mark registrations pertaining to inventions and products of nations now at war with the United States be abrogated or suspended by congressional enactment until such war is ended.

(The discussion concerned with the latter resolution does not differ materially from that brought up when the report of the Committee on Patents and Trade Marks was presented. As this will be printed in a succeeding issue of the JOURNAL, it is omitted in this connection.—Editor.)

Secretary Hostmann moved that the Committee be discharged with the thanks of the House.—Carried.

The Committee on Nominations reported as follows:

To the Chairman and Members of the House of Delegates:

Your committee on nominations submits the following names as officers for the ensuing year and asks your approval: *Chairman*, Samuel C. Henry, Chicago; *First Vice-Chairman*, Otto F. Claus, St. Louis; *Second Vice-Chairman*, Samuel L. Hilton, Washington, D. C.; *Recording Secretary*, Jeannot Hostmann, Hoboken, N. J.

Respectfully,

C. A. DYE,
J. A. POOL,
JOHN G. GODDING,
CHARLES H. LAWALL,
OTTO F. CLAU'S.

W. C. Anderson moved that the Chairman cast one affirmative ballot for the nominees.—Carried.

CHAIRMAN J. H. BEAL: Members of the House of Delegates, you understand the unfavorable circumstances under which we have been compelled to operate this year. I fully believe from my study of the question it is possible to make this House of Delegates a very useful instrumentality for benefiting the American Pharmaceutical Association and pharmacy at large. Unless I am a false prophet, that will eventually be the result of the action of the House. It needs cogent, sympathetic effort on the part of all of us. I hope you will give the new officers that sympathetic support.

After installation of the Officers-elect the House of Delegates was adjourned.

THE NEED OF MEDICAL MEN.

The sweeping demand of Surgeon-General Gorgas for 5000 more doctors, which is only a beginning, by the way, finds the profession and the colleges hard put to it, despite their unqualified patriotism, to meet the grave situation. As a consequence, therefore, all sorts of sacrifices will have to be made to secure the proper number of medical men and to give the service that the army needs. Inevitably, this will react on the civilian life and hospital service, and the impending medical famine can only be saved by the coöperation of all to prevent the waste, as it were, of professional material, which is a much more serious thing than some other wastes which are very much before the public. While there is no use of talking over spilled milk it is very plain that Congress and the executives must now do all that legislation or executive action can to conserve the medical resources of the country and insure that regular and continuous supply of doctors for the military arm and civil life that the educators last spring believed they were about to secure.—From an editorial, Philadelphia *Public Ledger*.

PROCEEDINGS OF THE LOCAL BRANCHES

"All papers presented to the Association and its branches shall become the property of the Association, with the understanding that they are not to be published in any other publication than those of the Association, except by consent of the Committee on Publication."—By-Laws, Chapter X, Art. III.

Reports of the meetings of the Local Branches should be mailed to the Editor on the day following the meeting, if possible. Minutes should be typewritten, with wide spaces between the lines. Care should be taken to give proper names correctly, and manuscript should be signed by the reporter.

CHICAGO.

The ninety-sixth monthly meeting of the Chicago Branch of the American Pharmaceutical Association was held at Kuntz-Remmlers restaurant, Friday evening, April 26, at 8.00, with a good attendance.

Dr. Oliver Smith of Parke, Davis & Co., was introduced by Vice-President Clark and presented a well illustrated lecture on the production of diphtheria antitoxin. Dr. Smith also discussed the use of vaccines and sera in the armies of the present war.

He stated that small-pox vaccine, typhoid vaccine and tetanus antitoxin were almost universally used in these armies. The custom has developed of using all three of these prophylactic agents with good results on the individual simultaneously, that is within one day. Three injections of typhoid vaccine of increasing strength at intervals of about a week, are usually made. The result of this prophylactic treatment has been that small-pox is practically unknown, typhoid is reduced to an exceedingly small percentage and tetanus is much lessened. Immense quantities of these sera and vaccines are being used. The British government has called for 1,250,000 ounces of antitetanic serum for 1918. The increase in the number of horses used for antitoxin production at Parke, Davis & Company is from about 250 to 750 and, of guinea pigs in proportion.

The prophylactic use of typhus vaccine has been demonstrated of much value according to figures given by Professor Smith, especially among doctors, nurses and other attendants in hospitals where typhus is found. It is generally conceded, however, that the disease can be controlled by proper sanitary and disinfectant procedures, especially the elimination of the body louse.

A report was made before the Branch by the committee having in charge the exhibit of U. S. P. & N. F. galenicals at the American

Medical Association convention in June. In addition to a large exhibit of galenicals, ten have been selected, including "tasteless" castor oil, several low-alcoholic elixirs and some syrups, for sampling to physicians who may be interested.

Local Secretary Gathercoal and Mr. Buss and Professor Day of the committee on arrangements discussed the preparations made and planned for the entertainment of the A. Ph. A. Convention in August. The program as outlined sounded very good to all present.

E. N. GATHERCOAL,
Local Secretary.

DETROIT.

The regular meeting of the Detroit Branch of the American Pharmaceutical Association was held at the Wayne County Medical Bldg., April 19. W. L. Scoville reported the death of one of our members, Wilbur F. Jackman, and expressed the loss felt by the branch. F. F. Ingram, Jr., gave a brief talk regarding the memorial portrait of Dr. Schlatterbeck which is being presented to the College of Pharmacy of the University of Michigan by the alumni and asked that all contributions toward the expense be made payable to Dr. A. B. Stevens, but sent to the speaker.

Chas. Barthen, foreman of the Ampoule Department of Parke, Davis & Co., gave a very interesting talk on the method of manufacturing and uses of ampoules. This form of medication was shown to possess all the advantages of hypodermics and to be much simpler for the use of the physician. E. R. Jones, Dean of the Detroit College of Pharmacy, explained the uses of "Hydrogenated Fats as future Ointment Vehicles." Samples of Ointment Zinc Oxide U. S. P., made from a combination of Crisco and wax, were shown in comparison with the product as obtained by the use of Benzoinated Lard. The difficulty of obtaining fats which have been hydrogenated

to the proper degree was discussed, since this is the trouble experienced with the products now on the market.

Hugh Craig, godfather of the Detroit Branch of the American Pharmaceutical Association, was welcomed to this city by President Kimnich on behalf of the local chapter. Mr. Craig is well known in American Pharmaceutical Association branch work having been president of the Chicago Branch for a number of years, resigning when coming to Detroit to become advertising and publicity manager for the Nyal Company. He was also secretary of the New York Branch of the American Pharmaceutical Association for half a dozen years previously.

Mr. Craig expressed his interest in the discussion of the use of hydrogenated fats as ointment vehicles. He said he had served his apprenticeship when manual labor was not a lost art among the druggists, and that he was exceedingly proud of this fact in particular. Although he had been campaigning for the Liberty Loan for the previous ten days, Mr. Craig's well-known sonorous voice was in good trim.

W. A. Hall gave a short talk of appreciation of the papers of the evening which expressed the crystallization of year's work by the authors. A motion was made that a vote of thanks be extended to the speakers. Dr. Hoffmann, member of the State Board of Pharmacy, gave a talk on "Dry Laws of Michigan." Since this is a question which is not as thoroughly understood as it should be, an animated discussion followed.

MAY STRAWN,
Secretary.

NASHVILLE

The Nashville Branch A. Ph. A. held its regular monthly meeting with the Nashville Drug Club, Thursday, March 28, President D. J. Kuhn presided.

Letters were read from Eugene Brokmeyer, giving an account of the Ashley suit, the Edmonds Bill, the Cleveland patent medicine situation and the reorganization of the War Industries Board. He called attention to the classification of rose water and glycerin as a cosmetic, under which the preparation is subject to taxation, and also advised that hydrogen peroxide was not subject to the Explosives License Act.

D. S. Sanders discussed the importance of proper book-keeping, and advised against long credits, he explained his method of handling

cash and personal accounts. D. J. Kuhn, in discussing the subject, stated that he had found no better method than the National Cash Register System. S. C. Davis was in favor of having druggists prepare their soda syrups from fresh fruits when in season and also stated that syrup of pineapple and other syrups were successfully prepared in his store. He discussed the preparation of syrup made by both methods in general use, and pointed out the advantages and disadvantages of one against the other. Mr. Coffey called attention to the increasing scarcity of castor oil, quinine, belladonna and other extensively used drugs.

The April meeting of the Nashville Branch A. Ph. A. was held in conjunction with that of the Nashville Drug Club, Thursday, April 18, when J. O. Burge presided. Harry Eskew, Tennessee Pure Food Drug Commissioner, addressed the meeting on the subject of sanitary service at the soda fountain. He stated that it was the intention of the department to prosecute all violators of the applying law. Dr. E. A. Ruddiman of Vanderbilt University brought attention to the scarcity of drug clerks and expressed his opinion that women should be encouraged to study pharmacy, and that they had proven their ability in laboratory and prescription work. D. S. Sanders spoke of the future of pharmacy and insisted that pharmacists should exact higher fees for dispensing. He compared the charges made for work at the prescription counter with that of other activities. W. R. White spoke of the work of pharmacists in the Army and Navy and said that drug journals should be sent to them, that this was easily possible, if druggists would send the publications they subscribed for to them after they have finished reading.

The Edmonds Bill was freely discussed and unanimously indorsed. The treasurer of the Nashville Branch A. Ph. A. was instructed to invest the surplus of the Branch in Thrift Stamps.

WILLIAM R. WHITE,
Secretary.

NEW YORK.

The April, 1918, meeting of the New York Branch of the American Pharmaceutical Association was called to order by Acting President Turner in the Lecture Hall of the New York College of Pharmacy Building on Monday evening, April 8, at 8.30 o'clock.

One-hundred and forty members and friends were present.

The minutes of the previous meeting were

read by the Secretary and adopted as correct. The Secretary read a letter from President McCartney in which he offered his resignation owing to the fact that he had entered the services of his country and would, therefore, be unable to be officially connected with any organization. It was moved, seconded and carried that the resignation be accepted and that the Secretary write a letter to Captain McCartney voicing the regret of the Branch at his resignation and congratulating him upon his appointment.

The Treasurer submitted his report which showed a balance of \$225.60 on hand. This report was ordered filed.

Membership Committee: The Membership Committee reported that it was about ready to get down to work and that the following applications have been received.

For Membership in the Parent Organization: Edmund D. Pintéi, 100 Sanford Ave., Jersey City, N. J.; Charles J. Chapman, 62 Maiden Lane, New York City.

For Membership in the Local Branch: Lewis E. Warren, 113 West 18th St., New York City; Winfield Scott Hubbard, 113 West 18th St., New York City, and Fred Schaefer, 190 Nassau Ave., Brooklyn, N. Y.

Committee on Legislation and Education: Mr. Lehman gave a detailed report on his trip to Washington in favor of the Edmonds Bill which report was ordered accepted.

Fraternal Relations: Chairman Lasgoff reported that he had appointed Clarence O. Bigelow, Mr. Timmermann and Mr. Walter for his committee and that the work was progressing favorably, which report was ordered filed.

Member of the Council: Professor Hostmann had no report to bring in.

New Business: Chairman Schaefer of the Special Committee on "PHARMACY HONOR MEDAL" brought in a detailed report with recommendations of the Committee. It was moved, seconded and carried that the report be accepted and that the Committee be empowered to obtain the moral support and consent of the Parent Organization to their proposition through the member of the Council and to take steps towards raising the \$1000.00 Fund.

A symposium was now presented on "What we have done towards winning the war."

The Speakers were. Dr. Lovis, K. S. Stoffer, S. E. Penick, Saunders Norvell and Professor H. V. Army. General discussion followed

which was concluded by a vote of thanks offered the speakers.

Under regular procedure the meeting was declared adjourned.

HUGO H. SCHAEFER,
Secretary.

PHILADELPHIA.

The regular monthly meeting of the Philadelphia Branch of the American Pharmaceutical Association was held, Monday evening, April the 22nd, at the Philadelphia College of Pharmacy, with the new President, W. W. McNeary in the chair.

After disposing of business matters, the reading of the minutes, committee reports, etc., the scientific program was opened by Dr. Mitchell Bernstein who read a very interesting paper on "Materia Medica and its relation to Pharmacy." Dr. Bernstein pointed out clearly the precise line of demarcation between the parts of materia medica which should be taught to pharmacists and the branches of the subject which should be left untouched. It is an extremely difficult proposition, so the doctor stated, to know just how much of the subject should be taught pharmacy students and just where to stop. A little knowledge in any subject is acknowledged a dangerous thing, particularly in this subject, and again it is impracticable and unnecessary to take up the subject from every viewpoint. It was agreed upon, however that a consideration of the therapeutic properties, origin, physical properties, doses etc., was quite essential for the student. The speaker did not think that it was necessary or wise, however, to go into minute details regarding the therapeutic value and uses of the drug, that this might have a tendency to make counter prescribers out of pharmacists.

Dr. Bernstein's paper was fully discussed by Dr. Frank White, Dr. Lowe and Messrs. Gershenfeld, Griffith, Fischelis and Cook. Professor Cook then presented a résumé of the articles on Drug Conservation, which have appeared in some of the journals. At the close of his talk, he suggested that the Branch go on record as advocating a campaign of propaganda among the physicians to urge them to prescribe less glycerin, sugar, tinctures, etc., and also to express a willingness to coöperate with the authorities in any conservation program, which they deem necessary to institute. Ambrose Hunsberger, who read the original paper here, on the question of conservation,

and who heads the special committee in charge of this matter, reiterated his former suggestions which concurred with the suggestions offered by Prof. E. F. Cook. Dr. Julius Sturmer also discussed the matter and pointed out the necessity for a conservation of clerks by working out the departmental plan in the drug store, which is perfectly practicable in the city store of fair size. In this way unqualified help could easily handle the sundries, patents, cigars, etc., and the drug work left for the qualified help. Other speakers who participated in this discussion were Messrs. Fischelis, Gershenfeld and Eberle and Dr. E. E. Stewart. Acting on the several speakers' suggestions the following resolutions and recommendations were unqualifiedly endorsed by the Branch.

RESOLVED—First: That we hereby pledge unreserved support to our Government in any proper plan which may be decided upon as necessary for the conservation of glycerin, sugar, alcohol and other drug supplies.

Second: That we do not believe any radical changes in the formulas of the United States Pharmacopoeia or National Formulary will be desirable or necessary as a feature of this conservation program, but that far more effective measures can be devised. Any extensive changes in the formulas of these books would cause complications in the drug standards,

as established by the Pure Food and Drugs Act, would take much time to prove, and would cause endless confusion and unexpected incompatibilities in prescription filling.

Third: That we recommend that effective conservation be accomplished by a Government ruling which will permit the use of only a portion of the amount of these materials required in a former year, say in 1916, and that this ruling apply equally to all users, thus enormously increasing the amount of material conserved and dividing the inconvenience among all users.

Fourth: That we further recommend the appointment of a joint committee of physicians and pharmacists from the National Association to conduct a campaign of information among physicians, urging the prescribing of smaller quantities of medicines containing these ingredients and also more frequent prescribing of such forms of medication as powders, capsules, tablets, pills and infusions and decoctions.

The meeting was well attended and four new members were elected. It is intended that a campaign for new members shall be instituted in the very near future and the cooperation of the present members is solicited.

IVOR GRIFFITH,

Secretary.

COUNCIL BUSINESS

A PH. A. COUNCIL LETTER NO. 13

PHILADELPHIA, PA., April 11, 1918.
To the Members of the Council.

Motion No. 20 (Request of Smithsonian Institution for Journals) and No. 21 (Election of Members) applications Nos. 85 to 114 inclusive have each received a majority of affirmative votes.

In Council Letter No. 11 (February 6, 1918) a tentative program for the Sixty-sixth Annual Meeting of the American Pharmaceutical Association, to be held at Chicago during the week of August 12 to 17th inclusive, was submitted by the Committee on Program and suggestions invited.

The program as finally revised is now submitted, as follows:

MONDAY.

- 9.30 A.M. National Association Boards of Pharmacy
- 2.00 P.M. National Association Boards of Pharmacy
- American Conference of Pharmaceutical Faculties.

- 8.00 P.M. National Association Boards of Pharmacy.
- American Conference of Pharmaceutical Faculties

TUESDAY

- 9.30 A.M. National Association Boards of Pharmacy
- American Conference of Pharmaceutical Faculties
- 2.00 P.M. Joint Session of National Association Boards of Pharmacy and American Conference of Pharmaceutical Faculties
- 7.00 P.M. Council Meeting
- 8.00 P.M. First General Session of Association

WEDNESDAY.

- 9.30 A.M. Scientific Section, first session
- Section on Education and Legislation, first session.
- Women's Section, first session
- 12.30 P.M. Alumni Luncheon

- 2.00 P.M. Commercial Section, first session.
Section on Practical Pharmacy and
Dispensing, first session
- 4.30 P.M. House of Delegates
- 7.00 P.M. Council Meeting
- 8.30 P.M. President's Reception.

THURSDAY.

- 9.30 A.M. Section on Education and Legisla-
tion, second session.
Commercial Section, second ses-
sion
Historical Section, first session.
- 2.00 P.M. Section on Practical Pharmacy and
Dispensing, second session.
Scientific Section, second session.
Women's Section, second session.
- 7.00 P.M. Council Meeting.
- 8.00 P.M. Second General Session of Associa-
tion.

FRIDAY.

- 9.30 A.M. Scientific Section, third session
Section on Practical Pharmacy and
Dispensing, third session.
Joint Session National Association
of Boards of Pharmacy.
American Conference of Pharma-
ceutical Faculties, and the Sec-
tion on Education and Legisla-
tion
- 2.00 P.M. House of Delegates
- 4.00 P.M. Entertainment

SATURDAY.

- 9.00 A.M. Council Meeting.
- 10.00 A.M. Final General Session of Associa-
tion

Do you approve of the above program?
This will be regarded as *Motion No. 22 (Ap-
proval of Program for 1918 Annual Meeting)*

The headquarters of the Association will be
at the Congress Hotel

J. W. ENGLAND,
Secretary.

415 N. 33RD ST.

A. PH. A. COUNCIL LETTER NO. 14

PHILADELPHIA, PA., April 15, 1918

To the Members of the Council:

Jeannot Hostmann submits the following
communication:

At the regular meeting of the New York
Branch of the A. Ph. A. held on the evening
of Monday, April 8th, the following was re-
ceived:

SPECIAL COMMITTEE ON PHARMACY HONOR
MEDAL

Your committee at a meeting held March
19th, decided to make the following recommen-
dations:

That a gold medal to be known as the Joseph
P. Remington Medal, suitably engraved, be
awarded to the man or woman who has done
most for American Pharmacy during the pre-
ceding year or whose efforts during a number
of years have culminated to a point during the
preceding year where the result of these efforts
would be considered as being the most import-
ant and advantageous for American Pharmacy.
That no bar be placed as to the candidate's
profession or kind of work accomplished

That your committee be empowered in
order to make the presentation of this award
permanent and perpetual to raise a fund of
\$1000.00 and in addition sufficient money to
pay the initial expense of the die, postage,
etc. That this money be raised by obtaining
a contribution of \$200.00 from the Branch
treasury and the rest to be made up by volun-
tary contributions from the members and firms
in New York City and vicinity. That the
\$1000.00 fund be invested in Liberty Bonds,
which bonds are to be held in trust by the
Treasurer of the American Pharmaceutical
Association.

That the medal be awarded by a standing
committee consisting of all the past presidents
of the American Pharmaceutical Association
and in case the number of living past presidents
is less than five the senior past vice-presidents
of the American Pharmaceutical Association
are to be drawn upon in sufficient number to
create a committee of five. The Secretary
of the New York Branch is to act as Secretary
for this standing committee.

That the medal be presented by the Senior
Past President of the Local Branch or in his
inability to do so, by other past presidents in
the order of their seniority.

That the New York Local Branch of the
American Pharmaceutical Association take
the matter in hand to the extent of devoting
the regular April meeting annually to the
presentation of this medal.

That the consent and moral support of the
American Pharmaceutical Association be of-
ficially obtained so as to lend a national aspect
to the presentation.

The above report was accepted and the
recommendations of the Committee were con-
curred in.

Upon motion duly seconded and carried the representative of the Branch in the Council was directed to obtain the consent and moral support of the American Pharmaceutical Association so as to lend a national aspect to the presentation.

In accordance with these directions I hereby move "That the Council grant the request of the New York Branch for the consent and moral support of the parent organization in the awarding of the proposed Joseph P. Remington Medal."

Perhaps the following letters might interest some members of the Council:

Dear Mr. Schaefer:

Yours of March 15th just missed me, as I left for Florida on the 12th and only just returned, which accounts for the delay.

I think well of your plan for a Pharmacy Honor Medal and that such a medal will stimulate effort of all kinds looking to the betterment of pharmacy. If your branch raises the money to supply the medal annually, it should undoubtedly have the privilege of awarding it at its meetings and naming the purposes and conditions. I do not see that the A. Ph. A. has any claim to recognition in the matter nor that it should necessarily be consulted. Of course the Branch should not expect to give it as coming from the parent association, in other words, it should not be the A. Ph. A. medal or the "Procter Medal" presented by the A. Ph. A. Rather it should be the "Procter Medal" or whatever name you decide to give it, presented by the New York Branch of the A. Ph. A. If you wish to have the Committee of Awards to consist of ex-presidents of the A. Ph. A. as you suggest, they would doubtless be glad to serve and aid so worthy a purpose. I feel that perhaps the consent and support of the A. Ph. A. could be secured as you suggest, but it could only be awarded as an A. Ph. A. medal under the conditions of the New York Branch supplying it and naming the conditions. You might word your medal and deed of gift as follows:

The American Pharmaceutical Association, through its New York Branch hereby presents to

Medal in token of splendid work done by him in furthering and advancing the progress of pharmacy in the United States of America

New York, March 18, 1918

This would either have to be decided by the

A. Ph. A. at its annual meeting or by its Council in the interim.

I hope you can succeed in making as great a success of this medal as you have of your branch.

Yours very sincerely,

(Signed) A. R. L. DOHME.

Prof. C. H. LaWall writes:

My dear Prof. Schaefer:

I have read with much interest your proposition to establish a Pharmacy Honor Medal and am inclined very favorably toward the idea as outlined.

Such a presentation taking place, as it probably would, during the winter months, would doubtless bring to New York many representative members of the A. Ph. A. from various parts of the country and would, in a way, establish a kind of mid-winter meeting, such as Dr. Walling has recommended in his address at the Indianapolis meeting.

I should think that the A. Ph. A. would be glad to give its authorization to such a project and I will lend my influence in that direction when the time comes to exert it.

Yours very truly,

(Signed) CHARLES H. LAWALL.

At Dr. Arny's request I am enclosing his letter in which he seconds my motion.

H. V. Arny writes:

"Approving most heartily of Professor Hostmann's motion I herewith wish to be recorded as seconding same."

Jeannot Hostmann's motion is: "That the Council grant the request of the New York Branch for the consent and moral support of the parent organization in the awarding of the proposed Joseph P. Remington Medal." The motion is seconded by H. V. Arny.

Discussion is now in order: the vote will be taken later.

Motion No. 23 (Election of Members). You are requested to vote on the following applications for membership:

No. 115. C. Allen Russell, State College, Pa., rec. by Charles H. LaWall and M. R. LaWall.

No. 116. Edward Vernon Kyser, 206 E. 2nd St., Covington, Ky., rec. by Theo. D. Wetterstrom and Louis Werner.

No. 117. Charles Braubach, c/o Merrell Chemical Co., 5th & Butler Sts., Cincinnati, Ohio, rec. by H. W. Jones and Louis Werner.

No. 118. Imaon Cooper Rawls, c/o Rawls & Carter, Inc., Main & Front Sts.,

- Hattiesburg, Miss., rec. by R. F. Grace and Adam Wirth.
- No. 119. James Norman Shirley, Hattiesburg, Miss., rec. by R. F. Grace and Christian Schertz.
- No. 120. Edward J. Hall, 138 Minerva Ave., Jackson, Miss., rec. by R. F. Grace and Adam Wirth.
- No. 121. Mitchell Bernstein, 910 Tasker St., Philadelphia, Pa., rec. by Charles H. LaWall and Ivor Griffith.
- No. 122. William Frederick Haase, Jr., 55 Hanson Place, Brooklyn, N. Y., rec. by Charles H. LaWall and M. R. LaWall.
- No. 123. John M. Williams, 115 W. 68th St., New York, N. Y., rec. by Jeannot Hostmann and Hugo H. Schaefer.
- No. 124. Walter Albert Woehner, 101 S. Third St., Missoula, Mont., rec. by Charles E. F. Mollet and Charles P. Valentine.
- No. 125. Joseph W. Ehman, 145 N. 10th St., Philadelphia, Pa., rec. by Charles H. LaWall and Ivor Griffith.
- No. 126. Donald Witherow Huber, 39 S. 10th St., Philadelphia, Pa., rec. by Charles H. LaWall and F. P. Stroup.
- No. 127. George Findley Stines, 246 Main St., Conneaut, Ohio., rec. by Charles H. LaWall and F. P. Stroup.
- No. 128. John Paul Ladriegen, 321 E. University Ave., Cincinnati, Ohio, rec. by Frank Cain and Theo. D. Westerstroem.
- No. 129. Albert Buengar, 1200 Fifteenth St., Denver, Colo., rec. by F. J. Lord and John A. Martin.
- No. 130. John A. Beard, 205 Main St., McComb, Miss., rec. by Robert F. Grace and Wm. B. Day.
- No. 131. Martial B. Castiex, 339 Bourbon St., New Orleans, La., rec. by Robert F. Grace and W. H. Cousins.
- No. 132. Guillermo Calderon, 700 E. San Antonio St., El Paso, Texas, rec. by Wm. B. Day and E. N. Gathercoal.
- No. 133. Eugene H. Daste, 2529 Bayou Road, New Orleans, La., rec. by R. F. Grace and Philip Asher.

J. W. ENGLAND,
Secretary.

415 N. 33RD ST

COMMITTEE REPORTS

REPORT OF THE COMMITTEE ON NATIONAL LEGISLATION FOR 1916-17.*

TO THE PRESIDENT, OFFICERS AND MEMBERS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION—

Your Committee on National Legislation beg leave to submit the following:

Matters pertaining to National Legislation relating to the Drug Trade have been in a very confused condition during the past year and largely remain so at the present time.

Your Committee do not feel justified in writing a long dissertation on the subject, thereby taking up your time as well as space in the JOURNAL, while the subject matter is still in a chaotic condition and will so remain until the War Revenue Measure and other legislation of vital importance have finally been enacted.

Your Committee or rather, the members thereof with one exception are delegates to the National Drug Trade Conference and matters pertaining to legislation have been referred to them, whereby they had more support and received more consideration.

In order to maintain a Committee on National Legislation and have things pertaining to legislation given constant attention, would require a great amount of time to be given by the members of the committee and the expenditure of a considerable sum of money by the Association. The Committee has at all times been ready to coöperate in all that was of interest to pharmacy.

The recommendations of President Wulling in relation to the recognition of pharmacists in the Government service were referred to the National Drug Trade Conference and a special committee was appointed by that body who have been quite active in relation to the duty assigned them.

* Presented at Indianapolis meeting A. Ph. A., 1917. It will be noted that this report was presented prior to action of some legislation spoken of. No changes are made in the report as this, as presented, constitutes part of the proceedings.—Editor.

The Bill relating to the adoption of the Metric System, to become effective in 1920 and which was referred to in the report at the Atlantic City meeting, still remains unfinished and doubtless will do so until the affairs of the country assume a normal condition.

Senator New, of Indiana, (August, 1917) introduced an amendment, amending Section 317 of the Revenue Bill, so that the Act shall not be construed to levy any tax, in addition to the tax imposed by existing law, upon alcohol used as a solvent or preservative in any medicinal product, or upon alcohol used for other industrial purposes not resulting in a beverage. If this amendment should be adopted, the tax on non-beverage alcohol would be \$1.10 per proof gallon. As the Bill now stands, the tax on non-beverage alcohol will be \$2.20 per proof gallon, and the tax on beverage alcohol will be \$3.20 per proof gallon. As the Finance Committee has already differentiated between beverage and non-beverage alcohol, it has conceded a point which could be used to good advantage in a plea for no additional tax on non-beverage alcohol.

Within the past few days (August, 1917), the Senate Post Office Committee, by unanimous vote, favorably reported the Brossard Amendment to the Post Office Appropriation Act, exempting ethyl alcohol used for non-beverage purposes from that provision of the Act which prohibits the mailing into "dry" territory any advertisement of, or solicitation of an order for, distilled spirits. The Postmaster General declined to express an opinion on the merits of the amendment when invited to do so by the Senate Post Office Committee, stating that this was a matter for Congress to determine.

The Chairman desires to publicly express his appreciation and thanks to Mr. E. C. Brokmeyer of Washington, D. C., for the information contained in the *Bulletins* he has regularly issued in relation to National Legislation. All of which is respectfully submitted.

JOHN C. WALLACE,
S. L. HILTON,
J. H. BEAL,
CASWELL A. MAYO,
Committee.

REPORT OF THE COMMITTEE ON PREREQUISITE ARGUMENTS.*

The presentation of a rather exhaustive report on this subject at the last convention, has left but little for your committee to offer at this time. But brevity does not necessarily indicate lack of interest and may perhaps be forgiven when connected with a program already well filled.

Since success is in itself the best of arguments, it will not be amiss to point to the steady progress of prerequisite legislation during the past year when no less than three states¹—a number greater than any preceding year—have amended their pharmacy laws so as to require graduation from a reputable school of pharmacy. Efforts in several other states, though unsuccessful for one reason or another, strengthened the evidence of the increasing demand for proper professional standards. In Illinois, where twelve years had passed since the subject of establishing the prerequisite was first seriously discussed in the convention of the state pharmaceutical association, the steady growth of sentiment in favor of the measure and its repeated indorsement by the state association led to success. The fortunate presence of four druggists in the state legislature, their activity in its behalf, well seconded by the officers and members of the state pharmaceutical association and by the board of pharmacy, awakened public opinion to the merits of the measure and enabled the passage, during the closing week of the legislature, of amendments to the pharmacy law, establishing the prerequisite and making the usual exemptions for those already enrolled on the lists of the board of pharmacy. This was a notable victory since it was achieved in face of the opposition of an old and well-known drug journal, whose publisher also operates a correspondence school and has fought the prerequisite bitterly since its inception.

In Iowa, success was more rapid and not less complete, but South Carolina furnished the real surprise of the year and demonstrated the professional preparedness of the South by adopting the prerequisite early in the year and with little fuss over it.

The Minnesota pharmacists voted overwhelmingly for prerequisite, but political considerations prevented the passage of their bill.

* Presented at Indianapolis meeting, 1917.

¹ Since then Virginia and New Jersey have passed prerequisite laws.—Editor.

In all these efforts, reprints of our last report were used as campaign material and in at least one instance, Iowa, we were informed with excellent effect.

Prerequisite laws are now in force in eight states including the four largest in population and these eight states contain approximately one-third of the drug stores of the United States. Nowhere have serious attempts been made to repeal these laws. This argues well for the satisfactory working out of the prerequisite principle and is calculated to instill fresh courage into the hearts of those who have fought so well and bravely for real professional requirements.

Credit for the steadily increasing favor with which pharmacists regard the prerequisite must be accorded in large measure to the pharmaceutical journals, the great majority of whom have ably supported the movement for higher educational standards.

Thus the *American Journal of Pharmacy* (Jan. 17, pages 38-42).

"All legislation which is not built on the bed rock of the necessity of prerequisite educational requirements, tends to the multiplication of drug stores and the demoralization of the practice of pharmacy. The failure to see this has been the chief cause in preventing the universal elevation of the apothecary in the United States and has caused the multiplication of evils connected with pharmacy. The time has gone by when any but the thoroughly educated applicant can be considered competent to own and conduct a drug store." * * * * "The sale of drugs and medicines by peddlers and other unqualified merchants, dispensing by physicians, the supply of competent drug clerks, the rapidly increasing number of drug stores, and the methods to be employed for training the future pharmacists are all questions which cannot possibly be satisfactorily adjusted until pharmacy is placed upon a sound professional basis." * * * * "Educational preparedness has brought forth success and prosperity in many fields of endeavor and it will do for pharmacy what it has done for other occupations." * * * * "Legislative bodies should increase the educational qualifications requested by pharmacists and by so doing provide pharmacists for the future who would unquestionably be best fitted to give that protection which the public has a right to demand." * * * * "The real need is not for a larger number of pharmacists, but rather for better pharmacists." * * * * "The profession of pharmacy is gradually going through an evolution similar to that through which medicine has passed. Higher educational requirements for pharmacists will in time reduce the number of drug stores to a point more nearly in accord with the pharmaceutical requirements of the public." * * * * "The public demands professional pharmaceutical service and pharmacy should, therefore, be maintained under such conditions that the public may receive the best expert service."

The Pharmaceutical Era (May 1916, p. 178) says:

"The trend of the times seems to indicate that the future pharmacist who is to perform any professional service must have a professional education, and that the institution which would seek to impart this knowledge must have a substantial foundation and an equipment which can be measured by scientific methods."

Northwestern Druggist (December 1916, p. 23) states:

"Pharmacists are rapidly coming to realize that prerequisite legislation is the only reform that will save the profession of pharmacy and enable them to keep the drug business in the hands of those who are best qualified to serve the public."

The Druggists Circular (Jan. 1915, p. 4) opines:

"High School graduation as a prerequisite to pharmacy college instruction and college instruction as a prerequisite to the board examination are all right, but if these qualifications be demanded, let us take steps similar to those recently inaugurated in Illinois and arrange a special high school course for apprentices in pharmacy."

The Bulletin of Pharmacy (October 1916, p. 391) affirms:

"Pharmacy is advancing all the time, in spite of a wail of pessimism that occasionally disturbs the equilibrium of the atmosphere. Lying directly at the root of the situation is the fact that educational requirements are being made stiffer from year to year; throughout the Union, states are swinging into line in this respect. Viewed as a whole the younger element is better equipped to carry on the work than its predecessors have been."

Midland Druggist (May 1915, p. 185) demands:

"The druggist, whether he be technically educated or not, should recognize that not only in pharmacy but in every other calling, future generations will need an even better educational environment than is needed to-day, and that individual opposition here and there to progressive measures is but a drop in the ocean."

We can conceive of no greater monument which pharmacists of to-day could leave to their posterity in the profession than an educational system walled up on all sides with prerequisite requirements which would prevent the entrance into pharmacy of incompetents who seek only financial returns."

The *Pacific Pharmacist* (December 1912, p. 187) predicts:

"We believe that within five years the graduation prerequisite will prevail in the majority of the states."

If time and space permitted such quotations could be continued indefinitely. Enough have been given, however, to indicate the practical unanimity of the pharmaceutical press of the country in support of the graduation requirement and to account for the fact that its truth and importance are being constantly brought home to an increasing number of pharmacists.

Few questions of public interest can be discussed without a reference to the great war in which our country is now engaged. The recognition of pharmacy as a profession and with it the granting of commissioned rank to pharmacists is now of engrossing interest. Pharmaceutical associations everywhere are urging such recognition and a bill has been introduced into Congress providing for it through the creation of a pharmaceutical corps in the army. Pharmacists are asking why they should be discriminated against in rank as contrasted with physicians, dentists and veterinarians. In this emergency how much stronger the position of pharmacy would be if professional training were required by law throughout the country?

WILLIAM B. DAY, *Chairman.*

LETTER TO THE EDITOR.

The movement to organize the pharmaceutical forces of our country by mobilizing them under the National Pharmaceutical Service Association should meet with prompt response in every part of our much loved land. It should result in most substantial assistance toward assuring for her a just and triumphant end to the great war of the Nations.

The united counsels and action of our pharmacist educators, scientific workers and commercial and manufacturing personnel, would, in moral effect strengthen our civil establishment at Washington, cheer and comfort our brave men in arms, give assurance of unfailing help and sympathy to our gallant soldier surgeons and physicians in camps and hospitals and at the fields of battle and prove an inspiration for patriotic unity and effort to other classes of our citizens in all the states of our Union.

If there have been differences in the past, arising from the friction of conflicting scientific opinions, from clashing mercantile interests or from contending personal ambitions these should all, now, be relegated to oblivion by the new glow of patriotism that should encircle the whole domain of our profession. Every unit of our calling should summon its whole man power to meet in common to reason and consult what can best and most efficiently be done to forward the welfare of our armies and serve the needs of our people at home devising the promptest means for promoting that welfare and supplying those needs.

Unusual quantities of all the items of our Pharmacopeia are urgently required, and the demand will continue to increase. New sources of the materials of manufacture will have to be made available; the best disposition will have to be made of the labor to be had and the talent employed and new changes in methods of packing must be learned and adopted. The causes for conflict and unnecessary differences must be found and eliminated. By no means the least important to our country's best interest and our own proper desert, if we cheerfully and unitedly sustain the objects of this Association, will be the attainment of a proper recognition of pharmacists in the actual service of our Government. The arguments that have been presented to the Committee in Congress in favor of the Edmonds Bill, which gives our graduates proper recognition are unanswerable.

In our great, free country, in private life, in time of peace, our theory is that of equality. The badge of honor is the badge of good citizenship and worthy conduct, but war requires the necessary insignia of distinctive authority, and our trained and educated soldier pharmacists should be distinguished in the behalf of better service, by the usual marks of office.

When victory, followed by a just peace, shall be ours, none will be readier than they to step

into their accustomed places of service and usefulness to society, where "The rank is but the guinea's stamp—The man's the gowd for a' that."

Yours very truly,

JOS. JACOBS.

BALTIMORE, MD., MAY 1, 1918.

JOURNAL AMERICAN PHARMACEUTICAL ASSOCIATION,*
Philadelphia, Pa.

The proposition to conserve supplies of glycerin, sugar and alcohol has been extensively discussed in the journals notably by Mr. F. A. Upshur Smith; but it is evident that much at least of the proposed change of formula is based on theoretical and not practical knowledge. It is easy to recommend and to work out upon paper how these three substances might be reduced or eliminated from the formulas in which they occur. It is much more difficult and requires to a great extent the element of time to determine to what extent even the slightest reduction of any of them may not materially affect both the therapeutic strength and consequent efficiency and the keeping qualities of the preparations in question.

Our orator Mr. Smith affirms in confronting this criticism that extemporaneous preparations would eliminate the needed keeping qualities and that druggists should in the interest of conservation make their own preparations for immediate dispensing rather than buy them as heretofore already prepared. Our orator, overlooks however, the fact that the Pure Food & Drugs Law is fully in force and that its requirements must be met on extemporaneous as well as permanent preparations and he forgets that the mere reduction of ten percent of glycerin or alcohol may change the entire strength or consistency or both of the preparation. The whole propaganda smacks of the notoriety variety and seems to your committee on Standards and Deterioration to be devoid of any value beyond that of suggesting that the formulas of the U. S. P. and N. F. be carefully studied and revised if possible with an eye to conserving these three items whenever and wherever possible. The United States Food Administration, through Mr. Charles W. Merrill, in charge of conservation of chemicals issued a bulletin as the result of the above propaganda and the American Drug Manufacturers' Association, through its executive committee which held a meeting in Detroit on March 2, 1918, instructed its Control Committee of its committee on Standards and Deterioration to proceed at once to Washington and ask for a hearing upon this important subject. Accordingly on Friday, April 12th at 11.00 A.M. there met in Room 410 of the Council of National Defense Building, Messrs. B. E. Reuter, W. C. Hughes and C. W. Merrill of the Food Administration, Mr. L. L. Summers of the War Industries Board, Drs. Alsberg, Kebler and Ewing of the Bureau of Chemistry. Mr. A. Homer Smith of the Medical Section, Council of National Defense, Major J. K. Mitchell of the U. S. Signal Corps and Drs. A. R. L. Dohme and F. R. Eldred of the Committee on Standards and Deterioration of the American Drug Manufacturers' Association.

Mr. Homer Smith presided and Mr. Summers at once pointed out that there was no need or occasion to conserve any alcohol as there was and would be plenty and yet more for a long time to come and that in his opinion, it was unwise to conserve it in medicinal preparations both because it represented but a very small part of the total consumption and this part could and should be conserved, should it become necessary, from uses far less essential and important than medicines. In fact, he went further and urged that the restrictions now placed upon the use of denatured and non-beverage alcohol be revised or made less severe because he had heard from hundreds of sources the difficulty of securing the necessary alcohol for treating the sick or preparing medicines in the pharmacies. This was uncalled for and should be changed by Congress as nurses, patients and pharmacists should be able to get the needed alcohol for treating and healing the sick. Thus the alcohol conservation fell by the wayside.

The same thing developed when sugar was considered and Dr. Dohme stated that the amount of sugar used in medicinal preparations amounts to about \$8,000,000 per year and represents about two-tenths of one percent of the amount used by confectioners and it was agreed that conservation of sugar in medicinal preparations was not to be considered as it is too infinitesimal to affect the consumption of sugar in this country.

* It should perhaps be stated that the Editorial relating to this subject was written before this communication was received.

This then left glycerin as the one item of the three under consideration to be conserved because the total output was less than either of the other two items and its use in war materials was increasingly important. Dr. Dohme pointed out that there were used in medicinal preparations about \$2,000,000 worth of glycerin based upon a fifty cent per pound price or 4,000,000 pounds and Dr. Alsberg pointed out that this represents about one-twentieth of the entire requirements of the country. If we add to this the amount now used in proprietary medicines and in toilet preparations it would make a total of about 10 million pounds of glycerin used in all drugs and toilet preparations and this represents about one-eighth of the country's requirements.

Thus the conservation in medicinal preparations, after a careful study of the situation, has resolved itself into the one item glycerin and regarding this Mr. Merrill advised us that probably no conservation would be necessary this year but probably would be next year. Dr. Alsberg in conclusion stated that we all feel that there are other steps that can be taken to meet the glycerin shortage besides affecting a change in medicinal products. Such other steps should be taken first. Every possible means, said he, of saving this glycerin should be exhausted before the pharmaceutical industry is touched. We feel that at some time, perhaps not this year or next or the year after that, but we don't think this applies to the present, the situation may arise that it will be necessary to touch the pharmaceutical products. He further pointed out that such changes in formulas of the U. S. P. or N. F. could not be made legally as these books were the legal standards by an integral part of our federal law and could not be changed except by Congress and he for one would not advocate any such change at this time.

In conclusion Dr. Dohme on behalf of the Committee on Standards and Deterioration of the American Drug Manufacturers' Association, who brought this hearing about states that that committee would undertake a study of the medicinal preparations of its members both official and unofficial with the purpose and intention of conserving glycerin in them wherever they found it safe and advisable to do so.

A. R. L. DOHME,

Chairman Committee on Standards and Deteriorations.

REPORT OF THE TREASURER OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

JANUARY 1, 1917, TO JANUARY 1, 1918

ST. LOUIS, MO., March 8, 1918.

We have examined the Books and Records of the AMERICAN PHARMACEUTICAL ASSOCIATION in the hands of the Treasurer, for the fiscal year ended December 31, 1917, and WE HEREBY CERTIFY that the foregoing is a correct Statement of the transactions of said Association for the period named and is also in accord with its Books of Account.

RODWAY & STONE,

[Signed]

JEFF K. STONE,

Certified Public Accountant, Missouri.

REPRINTS OF THE HEARING ON THE EDMONDS BILL.

While we have not at this time seen a copy of the printed report of the Hearing on the Edmonds Bill, we are reliably informed they are in print, and those interested should write their Congressman for a copy at once, as the supply is limited.

EDITORIAL NOTES

Editor: E. G. EBERLE, Bourse Building, Philadelphia, Pa.

Committee on Publication: J. W. ENGLAND, *Chairman*; G. M. BERINGER, CASWELL A. MAYO, H. B. MASON, E. L. NEWCOMB, and the Editor-in-Chief of the JOURNAL, General Secretary, Treasurer and Reporter on the Progress of Pharmacy, *ex-officio*.

Editorial Office: 253 Bourse Building, Philadelphia, Pa.

THE VISIT OF MAJOR D. A. COSSAR.

We regret that on account of duties Major Cossar could not accept of the hospitalities of the American Pharmaceutical Association. Part of a day was given to New York pharmacists, who were hastily brought together by Ex-President Caswell A. Mayo. A more extended visit was made in Toronto, where the Major made a three days' stay. It is reported that after leaving New York City, he was going to Washington and would soon thereafter return home.

The trip is said to be made in the interests of the Australian Army Medical Corps. While in Toronto he visited the Provincial "Salvarsan" laboratory and was also guest of the faculty members of the Ontario College of Pharmacy. According to the *Canadian Pharmaceutical Journal* the most interesting feature at a luncheon party of Mr. Graham, of the College, Mr. Jury and the Editor of the latter, was Major Cossar's narrative, outlining the incidents leading up to, and the establishment of the Australian Pharmacy Department of the A. M. C.

"Similar to British and Canadian experience, the utter incompetency of the old system and its antiquated methods produced the inevitable breakdown of this department. An independent member of parliament (a *rara avis* in Canadian politics) turned the spotlight on the situation, and a vigorous Minister of Defense wisely called to his aid a competent pharmacist.

"The aid afforded and advice tendered led to the organization of a department which has proved itself one of the most valuable adjuncts of the Army, and saved the Commonwealth many thousands of pounds in purchase of medical supplies."

In another article we give an outline of this department, its organization and work.

"While in Great Britain, Major Cossar was in conference with the British pharmacy authorities, and the information he imparted of the total inadequacy of the present methods, as also its gross and criminal wastefulness, was

coincident with the appointment of Mr. Glynn Jones, M. P., a special commissioner to investigate the conditions in the British A. M. C. both in France and Great Britain. Major Cossar's information is to the effect that the report of Mr. Glynn Jones, a competent pharmacist, so impressed the War Office that a reform is almost inevitable in the near future. Should this anticipation be realized, the whole problem of 'the pharmacist in the Army' will be solved for the Empire."

THE PHARMACY DEPARTMENT OF A. A. M. C.

The members of the Australian Pharmacy Corps are exclusively qualified pharmacists, enlisted under conditions similar to those which prevail with the other units of the A. M. C., physicians and veterinaries. The officers are: Senior Major, who ranks as staff officer of pharmacy service on the staff of the Director-General of the A. M. C. This position is now held by Major Cossar, who was first appointed Hon. Captain, promoted to Hon. Major, and again to full ranking Major.

Next in rank is Captain: the chief senior pharmacy officer of each state. Lieutenants are qualified pharmacists, head dispensers in general hospitals, base hospitals, and forward casualty stations. Staff-Sergeant is the lowest rank of any member of the unit, and is held by all assistant dispensers, and men in charge of medical stores.

Senior Major, the officer commanding, is responsible for all medical supplies, and through him all recommendations for purchases must be made. Captain, as chief senior officer of the State, has charge and supervision of all medical stores and supplies for his state. Lieutenant has charge of medical supplies of hospitals, casualty stations and is chief dispenser for such institutions. Staff-Sergeant is assistant dispenser under command of the Lieutenant and A. M. C. Quartermaster.

All officers in the pharmacy department must be regularly qualified pharmacists, and draw pay according to rank, as in all other units.

GASES GERMAN'S ARE USING.

According to *Drug Topics*, the following gases are or have been employed in the present war. Commenting, this publication says that both sides are now searching for a new type of poisonous gas that will be odorless, colorless and invisible. Such a discovery with practical means for application would contribute largely toward winning the war. Out of the resourceful head of some thoughtful pharmacist may come the discovery. Twenty of the gases now employed, are:

- 1—Allyl-isothiocyanate (allyl mustard oil), C_3H_5NCS (shell).
- 2—Benzyl bromide, $C_6H_5CH_2Br$ (shell).
- 3—Bromo-acetone, $CH_2Br.CO.CH_3$ (hand grenades).
- 4—Bromated methyl-ethyl-ketone (bromo-ketone), $CH_3Br.CO.C_2H_5$ or $CH_3.CO.CHBr.CH_3$ (shell). Dibromoketone, $CH_3.CO.CHBr.CH_2Br$ (shell).
- 5—Bromine, Br_2 (hand grenades).
- 6—Chloro-acetone, $CH_3Cl.CO.CH_3$ (hand grenades).
- 7—Chlorine, Cl_2 (cloud).
- 8—Chloromethyl-chloroformate (palite), $ClCOOCH_2Cl$ (shell).
- 9—Nitro-trichloro-methane (chloropierin or nitrochloroform), CCl_3NO_2 (shell).
- 10—Chlorosulphonic acid, $SO_3.H.Cl$ (hand grenades and "smoke pots").
- 11—Dichloro-diethylsulphide (mustard gas), $(CH_3CH_2)_2S$ (shell).
- 12—Dimethyl sulphate, $(CH_3)_2SO_4$ (hand grenades).
- 13—Diphenyl - chloro - arsine, $(C_6H_5)_2AsCl$ (shell).
- 14—Dichloromethyl ether, $(CH_2Cl)_2O$ (shell).
- 15—Methyl-chlorosulphonate, CH_3ClSO_3 (hand grenades).
- 16—Phenyl-carbylamine chloride, $C_6H_5NC.Cl_2$ (shell).
- 17—Phosgene (carbonyl chloride), $COCl_2$ (cloud and shell).
- 18—Sulphur trioxide, SO_3 (hand grenades and shell).
- 19—Trichloromethyl-chloroformate (diphosgene, superpalite), $ClCOOCCl_2$ (shell).
- 20—Xylyl bromide (tolyl bromide), $CH_3C_6H_4CH_2Br$ (shell).

ETHICAL PRESCRIPTION BLANK.

Edward V. Sheely, member of the A. Ph. A., has sent us a pad of prescription blanks, which he has named "Liberty Prescription Blank."

The Memphis Medical Association opposed the use of blanks bearing the name of pharmacists. The movement was favored by Memphis pharmacists who requested that ethical American drugs be used as far as possible, and this statement occurs on the blank with the name indicated above and two flags. The blanks are enclosed in cover with the name of the pharmacist, in this case that of Mr. Sheely and also bears the insignia of the A. Ph. A. The suggestion might well be generally followed.

SACCHARIN AS A SUGAR SUBSTITUTE.

According to the *Lancet*, the only interpretation of the very general use nowadays of saccharin is that a large section of the public value sugar merely for its sweetness and not for its food value or for its high calorific position. If the inherent property of sugar did not happen to be sweetness the employment of saccharin in its stead would be meaningless. This is an important point, because if a large proportion of the public seeks only a sweetener in using sugar in their beverages, then their demand can readily be satisfied by a sweetener substitute such as saccharin. In that case a considerable amount of sugar will be saved for those who use it for its real food purposes, and particularly for young growing people, to whom its energy value is of considerable importance. Sugar cannot be replaced by saccharin in the preservation of milk or in the preparation of jam, and the use of saccharin in beverages like tea and coffee will afford an important saving of sugar for such purposes. It remains to consider whether the use of saccharin for sweetening purposes is likely to disturb the health of the consumer. The evidence that saccharin did not appear to produce any harm in the organism was summed up in the *Lancet* last September and there is still no ground for thinking that it is in any way harmful, while its sweetening power is so great that only minute quantities suffice to satisfy the palate. It should be remembered that the use of saccharin has been prohibited in those cases where, by replacing sugar, the consumer would lose the food value contributed by that substance. Saccharin has no food value whatever.

Great Britain has taken control of the entire output of British saccharin and is to be distributed by or under supervision of the British Food Ministry.

LIBERTY LOAN SUBSCRIPTIONS THROUGH DRUG AND CHEMICAL INDUSTRIES.

When this is read the subscriptions to the Third Liberty Loan will have been closed and beyond a question in excess of the minimum. Every indication shows that the drug and chemical industries have contributed their part as heretofore and in excess of contributions to former loans.

MAKE OUR SODA FOUNTAINS SAFE FOR THIRSTY HUMANITY.

The *New York Herald* of April 7 has an article on the above subject, which is timely, not only because sanitary conditions should obtain about the soda fountain but also because the continued success of the business demands it. A boycott has been declared, according to the *White Plains (N. Y.) Record*, against dirty soda fountains and service. By educating the people to the importance of sanitary conditions it is hoped to hasten the day when no owner of a soda fountain can expect to attract patronage unless he maintains a high degree of cleanliness in his service.

SHOULDER STRAPS FOR WOMEN NURSES.

According to a recent issue of the *Official Bulletin* Mrs. Helen Hoy Greely of New York

City, before the Military Affairs Committee, advocated shoulder straps for women military nurses. She urged that medical women and women workers in military hospitals abroad should receive commissions. Military nurses, she contended, need rank of some sort to compel obedience in the hospitals.

We quite agree and again we repeat pharmacists should be given rank for this and equally important other reasons which have frequently been urged, so far without results.

Richard Edward White, associate editor of the *Pacific Pharmacist*, a pioneer druggist of San Francisco and known as a poet and prose writer, died on March 14 after an illness of six weeks. One of his poems, "The Midnight Mass," a legend of Carmelo Mission at Monterey, won fame for him as a poet. He published a volume of poems and some songs, and he belonged to a circle of men and women active in literary and art work in San Francisco. He was born in Dublin in 1843.

Powers-Weightman-Rosengarten Co., chemical manufacturers, are celebrating the 100th anniversary of the founding of the business. In a handsome souvenir the faces of the founders appear as well as pictures of the successive buildings of the firm, which show great expansion. The founders were John Farr, Thomas H. Powers, William Weightman, and George D. Rosengarten.

SOCIETIES AND COLLEGES.

THE CHICAGO MEETING OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

The time for the next annual convention of the A. Ph. A., to be held in Chicago during the week beginning August 12, is fast approaching. Officers of the different Sections have been busy and the Local Secretary, with the cooperation of druggists generally in Chicago, is actively engaged in preparation for the event. As far as possible papers to be read before the Sections should be accompanied by abstracts. It would add materially, if the programs of the Sections, listing these papers, would in a briefer abstract convey to the members an idea of their substance. Papers should be typewritten, double space between lines. It would be advantageous if the July and August issues of the *JOURNAL* could present the programs to the readers. Writers of the

papers should realize that the officers must have time to look over them so as to arrange the programs for the different sessions.

A FEDERATED AMERICAN PHARMA- CEUTICAL ASSOCIATION.

President A. R. L. Dohme has prepared a tentative plan for federating the American Pharmaceutical Association. This federation provides for a House of Delegates, a Council and a Board of Control. The first body is to be made of duly selected and elected delegates of the respective sections represented in the House of Delegates. In this tentative provision there are to be five delegates from each of the following organizations: N. A. R. D., N. W. D. A., A. D. M. A., P. A. of A., A. A. of Ph. C., N. A. B. P., A. C. of P. F., N. D. C. A., and U. S. Government Departments. Each State Pharmaceutical Association is to be

represented by two delegates, and each Local Branch of the A. Ph. A., consolidated with that of the N. A. R. D. branch by one delegate. Individual members not attached to any of these sections shall be entitled to the services and publications of the Association by paying their membership fee, but will not be entitled to a vote. All general business of the association is to be transacted by the House of Delegates, such as legislation, reception of delegates of sister associations, education, finances and association funds and prizes, reports of bureaus of the association, officers of the association and all matters bearing upon the relations of the drug trade and pharmacy to all outside interests and agencies such as government of nation and state and foreign nations and associations, other associations and agencies shall be discussed and acted upon. Its delegates shall be made up of five official delegates duly appointed or elected by each section so that each division of the drug industries, through its accredited association, is represented and also the interested departments of the U. S. Government, and the State Pharmaceutical Associations.

The Council is to be elected by the House of Delegates and to consist of two members from each of the Sections represented, except the local branches.

The Board of Control is to be elected by the Council and to consist of three members—a chemist, a pharmacist and a lawyer—all with pharmaceutical knowledge to act as executive committee of Council and House of Delegates and to have charge of association affairs and laboratories, bureaus and offices all through the year.

The details are further explained in President Dohme's presentation of the plan.

COUNCIL—The Council shall be elected annually by the House of Delegates but its members need not necessarily be members of the House of Delegates, although they must be members of the Association. Each trade section shall be represented in the Council by two Councillors, making eighteen Councillors, to which should be added three Councillors at large elected by the House of Delegates, who shall be chosen from the State Pharmaceutical Associations and Local Branches. One Councillor shall be elected by each section for a term of three years and one for two years, and the three Councillors at large shall be elected for one, two and three years, respectively. This will change the personnel of the Council every

year to some extent but still permit the average Councillor to serve long enough to become fully acquainted with the work of the Association. Councillors are eligible for re-election, but it is not intended that the Council shall be a self-perpetuating body. All business shall originate in the House of Delegates. The general secretary of the Association shall be secretary of the Council.

BOARD OF CONTROL—This shall consist of three members annually elected by the Council of the Association and shall have charge of the active management of its affairs during the year. They are to occupy the permanent offices and have charge of the bureaus and laboratories of the Association and shall reside in the city where these offices and laboratories are located, although they need not necessarily be residents of that city. They are to be paid salaries sufficiently large to justify them in devoting all their time to the work of the Association. One of them shall be an expert chemist and have charge of the chemical work and laboratories, one an expert pharmacist and business man to have charge of the business and pharmaceutical work of the Association, and one a legal expert with drug experience to have charge of the legal affairs of the Association. It is intended that they shall be permanently in office but it is thought advisable to elect them annually so as to provide for removal or replacement for any cause that may justify such action in the opinion of the Council. They shall be the executive and judicial side of the Association and shall have all reports, papers and addresses submitted to them before the annual meeting and with the assistance of the secretary shall prepare a proper digest of same to be presented by them to the meetings of the Association so as to save time and thus devote more time to the discussion rather than to the reading in full of such reports, addresses, etc.

They shall also act as the committee upon publication and publicity of the Association, in which capacity they shall have as associates the editor of the JOURNAL of the Association and the general secretary. The editor of the JOURNAL shall, however, have complete charge of the JOURNAL editorially, although the decision as to publication and general publicity of all matters pertaining to the Association shall be vested in the Publication Committee.

TRADE SECTIONS—These are the leading features of the federation idea, for without them it would manifestly be impossible to federate

such distinctly different interests as retailer, wholesaler, manufacturer, physicians' supply houses, colleges of pharmacy, proprietary manufacturers, etc., etc. They represent the present national associations interested in the drug trade and the plan is to have these associations retain their present organization and activities in so far as these pertain specifically to the branch of the trade covered by the respective association. Thus the N. W. D. A. will continue to discuss, decide and act upon all questions pertaining to the wholesale drug trade as they have heretofore handled them, and the same for the N. A. R. D., representing the retailer; the A. D. M. A., representing the manufacturer; the A. A. of Ph. C., representing the physicians' supply business; the Proprietary Association, the proprietary medicine business; the A. C. of P. F., the system of pharmaceutical education; the N. A. B. P., the preliminary and prerequisite requirements, examinations, etc., etc.

All matters of all of them that pertain to legislation, ethics, education, research, relations to city, state and federal governments, bureaus, agencies, etc., shall come up in the general sessions and be acted upon there. They shall have their own officers if they so decide and their president shall be, by virtue of his election, also a vice-president of the Association.

MEETINGS—It is expected and hoped that each and every such trade section shall hold its annual meeting if possible at the same time and place as the parent body, the federated A. Ph. A., but in a separate hall, as does the A. M. A. and its numerous sections. In this way all the various branches of the trade will have an opportunity of seeing and meeting one another and perhaps thereby saving each other special trips for that purpose. While it is preferable to hold such meetings at the place where the permanent offices of the Association are located, this is not necessary, and it is thought that this could be done every other year, thus holding every other meeting in some other section of the country.

A. PH. A. SECTIONS—These shall consist of the same sections as at present existing in the A. Ph. A., viz., Scientific, Historical, Practical Pharmacy and Dispensing, etc., and shall each be presided over by a chairman and officers annually elected by the sections. They shall hold these meetings as heretofore and as provided for by the Committee of Arrangements

consisting of the Board of Control, the local secretary and the general secretary.

BUREAUS—There shall be provided in the General Offices of the Association at its permanent home certain bureaus all to be under the direction and management of the Board of Control, with power to employ such clerical help and expert assistants as they may deem desirable and necessary with and by consent of the Association acting through its House of Delegates and Council.

a—Bureau of Chemistry and Pharmacy:

This shall have facilities for testing and examining and passing upon all products or preparations sent it by any members to determine their compliance with law, their label and in general get the Bureau's stamp of approval of the product without of course involving any legal responsibility whatsoever for such advice and examination. This Bureau shall also do such testing and assays for members as may come before it and also any research work of its own that its director may deem advisable upon approval by the Board of Control.

b—Bureau of Registration of Trademarks and Patents:

This Bureau shall keep a registration of all trademarks and patents granted to or belonging to members and issue in the Association JOURNAL reports upon same at such times as may be desirable. It shall also investigate trademarks and patents and secure same for members upon payment of the actual expense involved in same.

c—Bureau of Law, Accounting, Cost Price Systems, Advertising and Freight:

This Bureau shall be the legal bureau of the Association and shall advise membership upon all legal questions or other matters embraced in the subjects covered by the title.

d—Bureau of Exchange of Unsalable Goods:

This Bureau shall be a clearing house for exchanging of unsalable goods for members for salable ones provided the Bureau by being and keeping in touch with markets in the various sections of the country, can place them successfully in a part of the country to a member where they are salable. This will reduce extent of capital in business by reducing unnecessary stocks and will save manufacturers much annoyance by reducing the amount of returned goods.

e—Bureau of Employment and Registration of Employees: This Bureau, by developing a system of records of employees who may be seeking employment through it, will serve not only to secure employees for employers needing same, but will be able eventually to supply some useful data concerning the employee's record by writing to prior employers and gathering together the facts.

FINANCES—There will doubtless be some funds necessary to insure the rent of the offices and laboratories for a year and to furnish said offices and laboratories with furniture, apparatus and supplies. Perhaps some of the various "Funds" of the A. Ph. A., of which the majority are now serving little or no purpose except to accumulate interest, may be made the nucleus of the funds necessary to furnish and equip the offices and laboratories. The remainder can be secured by voluntary cash contributions of members. We had better rent such offices for the first few years to feel along our way before putting a large sum of money into real estate. It will then be time to decide if, as in case of the A. M. A., such rented quarters will be found to meet all our requirements, as I think they will. To maintain the expenses of the salary list, rent, bureaus, journals, publicity, legislative work, etc., it will require and justify a membership fee of ten dollars per year, which the services rendered will fully warrant for any member. We should secure at least 15,000 members and I think we can secure fully 20,000, and perhaps 25,000 members, because we have something real and valuable to offer the members in service, protection and information. On the basis of 15,000 members the plan will be self-sustaining, as will the journal or journals be, representing as they do the interests of a united industry which will practically unanimously respond in advertising and subscription to membership. Firms and corporations may as such be members of their trade sections as at present, but only individuals may be members of the Federated A. Ph. A.

THE NATIONAL PHARMACEUTICAL SERVICE ASSOCIATION.

At the regular monthly meeting of the National Pharmaceutical Service Association held April 9th, 121 applications for membership were acted upon, bringing the total membership in the association well above the 1200 mark.

Although less than one year old, this asso-

ciation has made great progress, and one of the very encouraging reports at the April meeting was that of the President, who stated that Congressman Edmonds had notified him that the propaganda work which had been done, was bearing fruit, in that the number of Congressmen who were interested in seeing the Edmonds Bill passed was constantly increasing. Instead of being urged to vote for the measure, many of them are coming to Congressman Edmonds and offering their aid in having the bill pass the House.

E. G. Eberle reported for the delegation which had been sent by the association to attend the Conference on the Edmonds Bill at Baltimore, March 18th, and the hearing at Washington, March 10th. A proposition from Mr. C. A. Mayo of New York to have petitions signed by members of the families of soldiers, asking that the Edmonds Bill be passed, was laid before the association, and it was decided to bring this matter before every member at an early date, so as to get the greatest value from this propaganda while the Committee on Military Affairs has the Edmonds Bill under consideration.

Ambrose Hunsberger reported that the support of the Philadelphia County Medical Society has been enlisted in this measure, and that they have appointed a committee of five physicians to cooperate in having the bill passed. The matter of sending literature on the newer antiseptic products to pharmacists now in the service was then discussed, and the committee which had been appointed for that purpose was instructed to consider it further.

Plans are being made by the Executive Committee to make the annual meeting of the association, which will be held some time during the second week of June, as comprehensive as possible.

OHIO BRANCH OF NATIONAL PHARMACEUTICAL SERVICE ASSOCIATION.

Prof. W. P. Rogers, former dean of the Cincinnati University Law School, at a meeting of the Ohio Branch of the National Pharmaceutical Service Association at the Hotel Gibson, Cincinnati, April 5th, made a patriotic plea for the recognition of pharmacists by the United States Government. Prof. John Uri Lloyd and Dr. Frank Cain were the other speakers, both urging a continuation of organized effort to secure the establishment of Pharmaceutical Corps in the American army. President Louis Werner, Sr., appointed the following committees:

Executive Committee—O. B. Thuma, F. W. Kisker, B. J. Pardick, Milton Franken, E. L. Pieck, Theodore D. Wetterstroem, Henry B. Waltermann, Theodore Rosenthal and E. C. Widrig.

Pharmacy Committee—Louis Heister, R. H. Cox, William L. B. Brittain, A. J. Doering, Alfred DeLang, Victor Muhlberg, Edwin Heinemann, E. A. Stuntebeck.

Advisory Medical Committee—Dr. E. O. Smith, Dr. B. Merrill Ricketts, Dr. E. W. Mitchell.

Advisory Legal Committee—Judge Smith Hickenlooper, Max Levy, Chester R. Shook.

Citizens' Committee—Judge David Davis, D. C. Keller, Charles G. Merrell.

STATE ASSOCIATION MEETINGS.

The following State Pharmaceutical Associations have held or will hold meetings during May, the dates and names of secretaries are given: Arkansas at Little Rock, 8-10, Miss Mary A. Fein; Kansas at Kansas City, 14-16, D. von Riesen, Maryville; Louisiana at New Iberia, 14-16, G. W. McDuff, New Orleans; Texas at Waco, 21-23, W. H. Cousins, Dallas.

The June meetings are: Alabama at Huntsville, 19-20, W. E. Bingham, Tuscaloosa. Colorado at Manitou, 18-20, Chas. J. Clayton, Denver; Delaware at Wilmington, 6, Miss Nora V. Brendle, Wilmington; Florida at Tampa, 12-13, J. H. Haughton, Palatka; Georgia at Tybee Island, 18-19, T. A. Cheatham, Atlanta; Idaho at Nampa, 12-13, Vic. Stolle, Boise; Illinois at LaSalle, 19-22, W. B. Day, Chicago; Indiana at Lafayette, 25-27, Wm. F. Werner, Indianapolis; Iowa at Fort Dodge, 25-27, Al. Falkenhainer, Algona; Kentucky

at Cerulean Springs, 18-20, J. W. Gayle, Frankfort; Maine, at Portland, 27-28, Dr. M. L. Porter, Danforth; Massachusetts at Swampscott, 17-19, James F. Guerin, Worcester; Michigan at Detroit, 25-27, F. J. Wheaton, Jackson; Missouri at Excelsior Springs, 11-14, Dr. H. M. Whelpley, St. Louis; Nebraska at Lincoln, 11-13, J. G. McBride, University Place; New Jersey at Spring Lake, 18-21, Jeannot Hostmann, Hoboken; New York at Catskill, 25-28, E. S. Dawson, Syracuse; North Carolina at Raleigh, 19-21, J. G. Beard, Chapel Hill; Ohio, Steamer at Toledo, 21-26, Theo. D. Wetterstroem, Cincinnati; Pennsylvania at Wilkes-Barre, 25-27, Robert P. Fischelis, Philadelphia; Utah at Provo, 19-20, F. J. Folland, Salt Lake City; Wisconsin, Elkhart Lake, 25-28, E. G. Rauber, Milwaukee.

NATIONAL ASSOCIATION OF MANUFACTURERS OF FRUIT AND FLAVORING SYRUPS.

An association of syrup manufacturers has been organized, representing nearly all of the establishments engaged in this growing industry. The first officers of the association are: *President*, M. E. Murray, president of the Murray Company, Boston; *Vice-President*, H. T. Cumming, secretary of J. Hungerford-Smith Company, Rochester; *Treasurer*, Edward H. Clark, treasurer of Richardson Corporation, Rochester; *Secretary*, W. W. Maltby of the Liquid Carbonic Company, Chicago. *Delegates-at-large*: A. H. Van Gorder, of the Cleveland Fruit Juice Company; K. H. Kalbfleisch, of the Joseph Middleby Company; Mr. Davidson, of Armour & Co., Chicago.

THE PHARMACIST AND THE LAW.

LABELS BEARING GUARANTY AND SERIAL NUMBER MAY BE USED UNTIL SUPPLY IS EXHAUSTED.

The Bureau of Chemistry of the Department of Agriculture, by an informal ruling authorizes manufacturers having stocks of labels bearing the guaranty and serial number, the employment of which after May 1, 1918, has heretofore been prohibited, to continue to use such labels after May 1, until their stocks are exhausted. The Department will expect, however, that manufacturers will abandon the use of the guaranty and serial number on all new labels and will assume that all labels upon

which the guaranty and serial number appear were printed prior to the issuance of the order prohibiting the use of such labels after May 1, 1918.

WHITNEY BILL TO BECOME A LAW OF NEW YORK.

Governor Whitman of New York has intimated (April 26) that he would sign the Whitney Committee bill and gives these reasons:

Because as district attorney of New York he had seen thousands of men and women

brought to a miserable end through the use of narcotics, and

Because, in his opinion, the bill is needed as a war measure and is designed as a co-operative measure to aid the government in regulating the control of habit-forming drugs, not alone in New York but elsewhere.

At a hearing granted by Governor Whitman there was present a large representation of physicians. Two general arguments were advanced, unconstitutionality of the law because it interfered with the professional relationship of physicians and patients and further because under the measure the control of the medical profession would be vested in a State body officered by laymen.

One point brought out strongly by several of the speakers was the charge that under the new law the criminal addict would be removed from the jurisdiction of the legal and police departments.

UNWARRANTED POSSESSION OF DRUG BY ANYONE IN MILITARY SERVICE CALLS FOR COURT-MARTIAL.

A drastic regulation designed to stamp out the drug evil in the United States army has been approved by the War Department as a part of a campaign to eradicate the habit-forming drugs.

By the order just issued it is provided that the possession of such a drug by any person subject to military law, unless ordered by a medical officer, will be considered prejudicial to military discipline, and the person so offending will be court-martialed for violation of the ninety-sixth article of war.

Examination of the men called in the draft has shown that an unexpected percentage are addicted to use of drugs in some form, and it is the purpose of the War Department to remedy this condition as rapidly as possible.

CHANGES OF ADDRESS.

All changes of address of members should be sent to the General Secretary promptly

The Association will not be responsible for non-delivery of the Annual Volume or Year Book, or of the JOURNAL unless notice of the change of address is received before shipment or mailing.

Both the old and the new address should be given thus.

HENRY MILTON,

From 2342 Albion Place, St. Louis, Mo

To 278 Dartmouth St., Boston, Mass.

Titles or degrees to be used in publications or in the official records should be given, and names should be *plainly* written, or typewritten.

BOOK NOTICES AND REVIEWS.

Principles of General Pharmacy and Chemistry, Parts I to VIII, 160 pp., by Charles T. P. Fennel, Ph.G., Phar.D., professor of Theoretical and Applied Chemistry in the Cincinnati College of Pharmacy, professor of Materia Medica in the Medical Department of the University of Cincinnati. The book is arranged for the student in pharmacy. The subjects are treated concisely, but sufficiently explicit for following the lecturer and to encourage further study.

There are quite a number of illustrations and the author has been successful in having

these bring out the essential points of the explanatory text. Nothing essentially new has been introduced but the author impresses the principles of his subject in a way that leads the student to think instead of memorizing facts.

Publications Received.

Bulletin of Purdue University, circular of information concerning the School of Pharmacy, illustrated.

The Lilly Scientific Bulletin, series 1, No. 9, Pharmacological studies of the Ipecac Alkaloids and some synthetic derivatives of cephaeline.

FIRST FORMAL FINDING BY FEDERAL TRADE COMMISSION AGAINST RESALE PRICE FIXING BY CONTRACT.

For a considerable time there has been a controversy throughout the country over the question of the right of manufacturers, wholesalers, etc., fixing resale prices at which their articles could be sold, and the right to maintain such resale prices has been contended for by them, and the question whether such right exists has been brought before the Federal Trade Commission numerous times.

Many hearings have been had, many complaints have been made, and much consideration has been given to the subject by that commission. Many business concerns have been refusing to sell to customers who would not agree to maintain the resale price fixed by the seller.

The Federal Trade Commission has just disposed of the first of these cases in which complaints have been issued, charging violations of law through fixing the resale price of articles, and an order to cease and desist from this practice has just been issued by it in the case of Chester Ken & Co., Inc., of Boston, manufacturers of proprietary medicines.

Attorneys for the company admitted that in the past the practices complained of had been in use. The order, the first in cases of this character, forbids the company to:

(a) Indicate to dealers the prices for which its proprietary or patent medicines shall be resold.

(b) Securing agreements from dealers to adhere to such prices.

(c) Refusing to sell to dealers who fail to adhere to such prices.

(d) Refusing to sell to dealers who fail to adhere to such prices upon the same terms as dealers who do so adhere.

(e) Furnishing any advantage to dealers who adhere to the resale prices, while refusing similar treatment to dealers who do not adhere to the prices.

This order of the commission follows the decision of the Supreme Court of the United States in the American Graphophone Company case lately decided by it.

Some of the most distinguished lawyers in the United States have appeared before the commission to argue this question, as well as many of the leading business concerns of the country, some of whom have insisted that the maintenance of resale prices was proper, and others who have contended that it was not. Almost all of the large department stores of the country have been heard in opposition to it.

JOURNAL OF THE

JOURNAL ANNOUNCEMENTS.

Subscriptions: Annual subscriptions in advance, including postage: United States and Mexico, \$4.00; Canada, \$4.35; foreign countries, \$4.50. Single copies, 35 cents. Remittances should be made payable to Treasurer H. M. Whelpley, but mailed to JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 211 Church St., Easton, Pa., or 253 Bourse Building, Philadelphia, Pa. Under the rules of the Post Office the JOURNAL can be regularly mailed only to bona-fide paid subscribers.

Requests for Back and Missing Numbers: Requests for back and missing numbers should be typewritten and sent to the Editor. Claims will not be allowed if sufficient notice has not been given of change of address, and in no case if received later than sixty days from date of issue. Notice of change of address should give old and new address.

Contributions: The JOURNAL accepts no responsibility for the opinion of its contributors. Contributions should be typewritten and sent to the Editor; use only one side of the sheet for writing, and double-space the lines. Articles are accepted for publication on condition that they are contributed solely to this JOURNAL; and "all papers presented to the Association and its Branches shall become the property of the Association, with the understanding that they are not to be published in any other publications than those of the Association, except by consent of the Committee on Publication." (By-Laws, Chapter X, Article 11.)

Reprints: Authors may obtain reprints of the Eschenbach Printing Company, Easton, Pa., at the prices attached to the proof sent

them, provided the order is received with the returned proof. The prices are also given on this page. Otherwise type is distributed as soon as the JOURNAL is printed.

Advertisements: Communications relating to advertising should be sent to the Editor. Forms close on the first of each month, and copy should be in by the fifteenth of the month preceding date of issue, to receive proof. Date of issue—the fifteenth of the month. Advertising rates sent on request.

Membership: Applications for membership in the American Pharmaceutical Association may be made of any of the officials. The annual payment of five dollars covers the annual dues and subscription to the JOURNAL. Members receive, also, the publications of the Association that are distributed free of charge.

Further information will gladly be furnished by any of the officers of the Association and members.

Cost of Reprints: Reprints will be furnished at the following prices:

SCHEDULE OF RATES FOR REPRINTS, INCLUDING POSTAGE.

| No. copies. | 4 pp. | 8 pp. | 12 pp. | 16 pp. | Covers. |
|-------------|-------|-------|--------|--------|---------|
| 50 . . . | 1.54 | 3.08 | 4.62 | 6.16 | 1.27 |
| 100 . . . | 1.76 | 3.52 | 5.28 | 7.04 | 1.54 |
| 150 . . . | 1.98 | 3.96 | 5.94 | 7.92 | 1.82 |

Orders may be sent to JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION, 211 Church St., Easton, Pa., or 253 Bourse Building, Philadelphia, Pa.

OFFICERS OF THE AMERICAN PHARMACEUTICAL ASSOCIATION 1917-1918.

President—Charles Holzhauer,* Newark, N. J.

Acting President—Alfred R. L. Dohme, Baltimore, Md.

Honorary President—W. L. Dewoody, Pine Bluff, Ark.

Second Vice-President—Leonard A. Seltzer, 32 Adams St., W. Detroit, Mich.

Third Vice-President—Theodore J. Bradley, 70 St. Botolph St., Boston, Mass.

General Secretary—William B. Day, 701 So. Wood St., Chicago, Ill.

Treasurer—Henry M. Whelpley, 2342 Albion Place, St. Louis, Mo.

Reporter on the Progress of Pharmacy—H. V. Army, 115 West 68th St., New York, N. Y.

Editor of the Journal—E. G. Eberle, 253 Bourse Bldg., Philadelphia, Pa.

Local Secretary—E. N. Gathercoal, 701 So. Wood St., Chicago, Ill.

Chairman of the Council—Lewis C. Hopp, 1104 Euclid Ave., Cleveland, Ohio.

Secretary of the Council—J. W. England, 415 North Thirty-third St., Philadelphia, Pa.

*Deceased November 19, 1917.

WILLIAM PERRY PORTERFIELD

FARGO, NORTH DAKOTA

President, National Association of Boards of Pharmacy, 1917-1918

W. P. POTTER

JOURNAL OF THE AMERICAN PHARMACEUTICAL ASSOCIATION

VOL. VII

JUNE, 1918

NO. 6

WILLIAM PERRY PORTERFIELD.

W. P. Porterfield, president of the National Association of Boards of Pharmacy is a native of West Virginia. He was born at Martinsburg, December 20, 1856, and received his early education in the public schools of this city. In 1878, he graduated from the Philadelphia College of Pharmacy.

In 1882, Mr. Porterfield moved to Dakota, before the division of the territory and when the population was less than 150,000. He located in Fargo and here opened a drug store under the firm name of Fout and Porterfield. Eleven years ago he was appointed member of the North Dakota Board of Pharmacy. He was twice elected president of the State Pharmaceutical Association and has served on the Executive Committee of the N. A. B. P. for three years and at the Indianapolis meeting was elected president.

Mr. Porterfield is a farmer as well as pharmacist, and on an extensive scale, farming nearly two thousand acres. He is deeply interested in municipal and state affairs, has been a member of the Fargo Park Board for the last ten years, and State Senator for four years. He is director of one of Fargo's banks and is secretary of the Red Cross in his home city and Inspector of Explosives for the State of North Dakota.

EDITORIAL

E. G. EBERLE, Editor

253 Bourse Bldg., PHILADELPHIA

THE INTERDEPENDENCE OF MEDICINE AND PHARMACY IN WINNING THE WAR.

THERE is a disposition among some army medical men, and others, to underestimate the importance of pharmacy, and yet they must admit that pharmaceutical skill and knowledge are significant in the treatment and surgical procedure for the rehabilitation of their patients. In civil practice some doctors prepare and dispense the medicines employed by them, but even then the constituents or finished preparations are made by pharmacists. Such practitioners assume privileges for which they are unwilling to grant druggists the reciprocity of counter-prescribing, and rightly so. Two wrongs never make a right.

In providing a reliable materia medica for the medical profession pharmacists perform a responsible and inherent duty. They are willing to work in their particular sphere of activity; they do not expect undeserved distinction, but they fail to appreciate why the degree of their importance should now be less, when the exigency for the kind of service they are qualified for is greater. Reason indicates to us that the functions of pharmacy have not changed, but simply have not been adapted to our military organization. Dr. Philander P. Claxton, U. S. Commissioner of Education, said in an address last month that the greatest danger to the Allies is not in the exhaustion of man power but the loss of technical and scientific men. Because there has been no provision in the Army for pharmacists, in the capacity for which training and education have qualified them, many have secured commissions in other departments of the Service, and thus the ranks of available pharmacists have to that extent been depleted. It is reasonable to assume that unless provision is made for them, those in the succeeding drafts will do likewise. It is admitted that if commissions are granted to pharmacists it will improve the general status of pharmacy, but surely this is desirable and in the interest of public health.

The devotion of medical men speaks for their splendid citizenship, but there is a serious doubt as to whether the Medical Department will be able to enroll a sufficient number of doctors for the needs of the growing army unless the services of pharmacists are utilized. Preparedness has attained to a higher valuation than formerly. Pharmacists desire to help in winning the war as loyal citizens and as participants in the best medical service possible for the men engaged in making the world a safer and better place to live in. They contend that organized pharmaceutical service is essential to the Medical Department of the U. S. Army because there is an interdependence between medicine and pharmacy. Even in

civil life this has not been strongly enough impressed nor fully appreciated by either profession. Pharmacists on the one hand realize that compelling necessity has added many non-pharmaceutical lines to the drug stocks, and this makes them reluctant in vigorously asserting their rights to professional recognition, notwithstanding that the services rendered by them are so determined by law and practice, the Government in its several departments and the medical profession by accepting of their products and standards. Physicians, on the other hand, are not fully responsive to the claims of pharmacy, chiefly because of the conditions in the average drug store; their perspective is the stock, whereas it should be the department and the service which is concerned with and contributes to the progress of medicine.

Development proceeds along the lines of least resistance, and hence the conditions of pharmacy are responsive to environments, but this should not inhibit coöperation of physicians and pharmacists in efforts which, if successful, will unquestionably redound to the advance and benefit of both professions. Medicine can only hope to continue its forward strides if pharmacy is progressive, and if the services of pharmacy are not most efficiently utilized now, when it seems almost imperative that they should be, both professions will suffer as a result, after the war. The future progress of medicine is largely dependent on that of professional pharmacy, and the sooner the interdependence and interrelation of these professions is recognized the better for them and for the public. Disparagement to the least of these will do damage and injury to both.

The armamentarium of the doctors has been made possible by pharmacists and is a prerequisite in the successful treatment of the sick and wounded. Pharmacists have, under trying conditions, solved the problems of drug production and supply; their suggestions in a number of important matters have been accepted and practically applied by the Government; they have loyally and patriotically given their money, time and places of business for carrying into effect the beginnings of several of the great preliminary promotions of the country; they have labored under difficulties to meet the demands for medicines; they have cheerfully accepted restrictive buying and selling orders; relatively more reports whereby they might be and are taxed were required of them. They are convinced by past military history and knowledge and the experience of other countries that properly organized pharmaceutical service is essential for the Medical Department of the U. S. Army.

There is a possibility of bringing pharmacy into more active and efficient coöperation with medicine for the common weal of the men in arms. Medical men can convert the possibility into achievement if they are sincerely desirous for the advancement of pharmacy. They have heretofore voiced their support; will they now more actively impress their views and aid in the endeavor to es-

establish an organized Pharmaceutical Corps as an integral part of the Medical Department of the U. S. Army? Thereby they will advance professional pharmacy—one of their often-expressed desires—and bring into more hearty accord the efforts of physicians and pharmacists in purposes for which they are united, but above all they will render an invaluable service to the soldiers and to the enlisted medical men.

E. G. E.

THE PREPAREDNESS OF PHARMACISTS FOR SERVING THEIR COUNTRY.

HERETOFORE references have been made to suggestions and resolutions offered by Branches of the American Pharmaceutical Association, which were of such value that they were subsequently embodied in related war measures.

On May 18, 1917, President Frederick J. Wulling, of the American Pharmaceutical Association, addressed His Excellency, President Wilson, as follows:

MR. PRESIDENT: As president of the American Pharmaceutical Association and with the concurrence of Mr. Lewis C. Hopp, Cleveland, Ohio, chairman of the Council of the Association, I hereby pledge the loyal support of the Association and tender to you and the Government such services as the Association can give in the present crisis of the country. Many of the members of the Association have already offered their individual services, but the Association may be able to give a service as an organization. It is ready and willing to help the country in any way it can and holds itself in readiness to be advised by you or by your orders.

President R. A. Lyman, of the American Conference of Pharmaceutical Faculties, addressed the President in a communication of May 1, 1917, wherein it was more specifically stated how this body could be helpful to the country. The letter reads:

MR. PRESIDENT: The Executive Committee of the American Conference of Pharmaceutical Faculties, representing forty leading Colleges of Pharmacy of the United States, has authorized me to inform you that the services of the schools belonging to this Conference are at your command. This organization wishes to render to the country any and every possible service. Some of the special services which these schools can render are suggested below:

1. The manufacture of pharmaceutical preparations, official or non-official, in such quantities as the Government needs.
2. The microscopical and chemical examination of purchases of crude drugs, for the purpose of identification, and the detection of adulterations.
3. The physiological and chemical standardization of medicinal products.
4. The manufacture of medicinal synthetics.
5. The chemical, microscopical and bacteriological examination of food-stuffs.
6. The supplying of crude medicinal plants, such as *Digitalis* and *Belladonna*, which are now on hand, or are now growing in our drug plant gardens. The latter will be available this fall.
7. The growing of crude drugs upon a larger scale than is now attempted and the supplying of information or trained men to those who wish to engage in the cultivation of medicinal plants.

Work along the lines indicated has been done for the Government on quite an extensive scale. Some of the schools offered their teaching and laboratory facilities and extended preparatory courses for those enlisting in the Hospital Service. The Department of Pharmacy of the Oregon Agricultural College directed the collection of native *Digitalis* by farmers.

At the April meeting of the New York Branch of the American Pharmaceutical Association, Dr. H. C. Lovis, as chairman of the Committee on Military Preparedness of the American Drug Manufacturers' Association, told of the work which has been done by that committee beginning on *February 4, 1916*, when resolutions were adopted by the Association as follows:

WHEREAS, The President of the United States has made an appeal to its citizens on behalf of military preparedness, and

WHEREAS, Adequate military preparedness involves not only the training of citizens as soldiers and the provision of ships, of arms, and of munitions, but also the organization of all the vast industries of the country with a view to their prompt and effective mobilization in case of war, and

WHEREAS, The provision of medical and surgical supplies promptly and in adequate quantities is a most important phase of such preparedness; therefore be it

Resolved, That in the opinion of the National Association of Manufacturers of Medicinal Products* definite plans for the mobilization of all private resources for the manufacturing and delivery of medical and surgical supplies for the Army and Navy of the United States in case of war should be formulated and promulgated at once by the Government; and be it further

Resolved, That the Members of the National Association of Manufacturers of Medicinal products hereby pledge their hearty coöperation in the formulation and promulgation of such plans of mobilization to the end that in the event of war the resources of the United States, for the preparation of medical and surgical supplies, could be made use of by the Government with the least possible delay, confusion and expense.

These and prior editorial comments and the symposium of the New York Branch of the American Pharmaceutical Association on "What the Drug Trade Has Done to Win the War" indicate the possibilities of pharmaceutical service, give an idea of what has been done by the allied interests and emphasize that pharmacists realize the importance of their work and have a vision of things necessary for winning the war that extends beyond the limits of their immediate activities. These same Interests are convinced that a Pharmaceutical Corps is necessary for the U. S. Army.

Write your Congressmen and persuade some of their other constituents, especially those of the medical profession, to do likewise. E. G. E.

* Now American Drug Manufacturers' Association.

MICROCHEMISTRY OF THE ALKALOIDS OF DATURA.*

BY CHARLES O. LEE.†

Atropine was discovered in roots of belladonna in 1831. As it occurs in commerce it usually contains some hyoscyamine. Atropine appears in the form of white auricular crystals or a more or less amorphous white powder. It is colorless but has a bitter, acrid taste, and gradually assumes a yellowish tint upon exposure to air. It is soluble at 15° C. in 130 parts of water, 3 parts of alcohol, 16 parts of ether, 4 parts of chloroform, 50 parts of glycerin and melts at 115° C., forming a colorless liquid. Atropine volatilizes above 115° C. and condenses into little colorless drops which will crystallize in contact with water, or by the addition of a crystal. Aqueous solutions of atropine are strongly alkaline and as a base atropine forms many soluble salts with acids, solutions of which decompose upon standing. For extemporaneous use, solutions of atropine sulphate may be heated to 100° C. with only a slight decomposition.

Chemical Properties.—Ladenberg who studied the mydriatic alkaloids found that the alkaloids atropine, hyoscyamine, and hyoscyne possess a common formula $C_{17}H_{23}NO_3$. Other authorities give hyoscyne the formula $C_{17}H_{23}NO_4$. It was found also that these three alkaloids formed salts with gold chloride with varying fusing points. The atropine gold salt fuses at 135° C. The hyoscyamine gold salt fuses at 160° C. and the hyoscyne gold salt fuses at 190° C.

Atropine is an ester and on hydrolysis yields a basic substance tropine, a pyridine compound, and optically inactive tropic acid, which is an aromatic acid. Hyoscyamine has been shown to be the ester of tropine with two tropic acids. Atropine therefore appears to be racemic hyoscyamine. Dextro hyoscyamine has also been prepared by the union of tropine with dextro-tropic acid.

Ladenberg obtained hyoscyamine from tropic acid and tropine as he did atropine, hence they must be isomers. In condensing the split products of hyoscyamine, atropine was obtained. Bauer⁵ states that atropine is optically inactive but that hyoscyamine is levo-rotatory. Merck saponified hyoscyamine with hot water and got tropine and levoactive tropic acid. This active tropic acid is converted into the inactive state by the action of an alkaline solution. The same will happen with hyoscyamine. If hyoscyamine is melted alone or with small amounts of an alkali it changes to atropine. The change of one isomer into another goes on in alcoholic solution, without interfering with contemporary reactions according to Gadamar. Tunmann² also states that hyoscyamine goes over into atropine during the process of extracting from plants.

In his further researches Ladenberg succeeded in converting the inactive tropic acid into the two optical isomers by the aid of quinine salts and with the

*Read by title, Scientific Section A. Ph. A., Indianapolis meeting, 1917. The article also included a classification of alkaloids, their occurrence, general properties and reactions, pharmacological action and therapeutic uses. These divisions are omitted with consent of the author.
—EDITOR.

† Purdue University School of Pharmacy, Lafayette, Ind.

synthesis of tropine; hyoscyamine may be made synthetically. Amenomiya got tropine from atropine and by treating tropine with 1-tropic acid he got 1-hyoscyamine. Bauer¹ considers atropine a tropine of tropic acid. Willstätter synthesized both tropine and atropine as successfully as tropic acid had been synthesized. In 1883 Ladenberg obtained atropine by condensing tropic acid and tropine in the presence of dilute hydrochloric acid, with a yield of 17.7 percent of the theoretical yield of levo- and dextro-hyoscyamine. The former is considered more active than the latter.

Molisch⁶ says that hyoscyamine resembles atropine very much and can be easily changed into atropine. He also considers that atropine forms the basis of the Solanaceous alkaloids, and is bicyclic and tertiary and of an alcoholic character. Tunmann suggests that hyoscyamine is the principal alkaloid of this group but goes over into atropine in the process of extraction.

The investigation of Willstätter showed that a similar ring system was at the base of the alkaloids of the tropan group. In 1863 Kraut first split atropine into tropine and tropic acid by boiling it with baryta water. This meant much regarding the constitution of atropine. This splitting of atropine is considered a saponification process in which atropine is considered the ester of tropine and tropic acid. From this the constitution of tropine and tropic acid can be obtained.

Gompel and Henri¹⁴ found that atropine has 3 absorption bands at (λ)—2645, 2580 and 2505, respectively, with general absorption, rapidly below 2493. The three bands are apparently those of the benzene ring replaced at about 30 units toward the red. The remaining benzene bands are marked by the strong absorption of the rest of the molecule. Five milligrammes may be detected in 10 mls of solution.

It has also been found that atropine and hyoscyamine, when treated with anhydrous agents, go over into atropamine and belladonnin, two probable stereoisomeric bases.

PLANTS OF THE SOLANACEAE.

This group of plants includes, *Atropa belladonna*, *Scopola carniolica*, *Hyoscyamus niger* and *Datura Stramonium*.

Alkaloidal Yield—Tunmann suggests that both soil and temperature conditions have a great deal to do with the alkaloidal content of this group of plants, and that there is only little difference in the alkaloidal yield of cultivated and wild plants. In the years 1907 to 1911 Burman obtained, respectively, 0.097, 0.082, 0.045, 0.046 and 0.099 percent of atropine from atropa grown in the same spot. These variations are supposedly due to climatic conditions which he considers affect the alkaloidal yield of plants markedly. It has been found that nitrogen has some relation to the formation of alkaloids in plants. Also tests have been made which show that temperature is a considerable factor and as the temperature increases the percentage of alkaloid decreases, and *vice versa*.

It has been shown that leaves exposed to the sun have somewhat more alkaloid than the shaded leaves. In other cases it is reported to be more abundant in the mesophyll of the leaf and in shaded parts of the plants and deeper tissues.

In cultivated plants of *Datura* the yield of alkaloid from fertilized soil was 0.342 percent, from the unfertilized soil 0.325 percent. Seeds of these plants yielded, respectively, 0.283 and 0.279 percent of alkaloid. Chevalier reports that the alkaloidal yield was increased by the use of nitrogenous fertilizer.

Feldhaus found in the seed of *Datura* 0.333 percent of alkaloid, in the root 0.1, in the leaves 0.39, in the stems 0.54, in the corolla 0.439, and in seedling 0.67 percent total alkaloids. In three-year cultivated plants of California, Sayre reports 0.519 percent total alkaloid. The leaves of these plants yielded 0.642 percent, younger stems 0.431 percent, older stems 0.167, roots up to 0.5 and seeds up to 0.8 percent.

The individual differences of the alkaloid yield of the *Daturas* is small, *Datura stramonium* yielding 0.46–0.55 percent as compared with *Datura tatula* yielding 0.47–0.63 percent.

Ciamician¹⁶ states that the alkaloidal content of *Datura* can be considerably increased by inoculation with such organic substances as pyridine tartrate, asparigin, dextrose, benzoic acid and quinol.

In *hyoscyamus* the alkaloidal yield is said to vary greatly, averaging in the fresh leaves about 0.15 percent and in the fresh seeds about 0.30 to 0.50 percent total alkaloids and a yield of hyoscyamine for 0.04 to 0.07 percent.

MICROCHEMISTRY OF THE SOLANACEOUS ALKALOIDS.

Localization.—*Atropa*, *Hyoscyamus* and *Datura* have been studied microchemically. In the main most of the microchemical studies agree.

The seeds have been most thoroughly investigated. Here the alkaloid is found in the storage tissue, the epidermis being alkaloid-free. Barth claims there are only traces of alkaloid in the endosperm and embryo of unripe seed.

Hyoscyamus was investigated thoroughly by Siim Jensen. He reports that alkaloid is found in the epidermis of the ovary, less in the parenchyma and placenta. In the calyx, the parenchyma next to the sieve tubes contains the alkaloid, in the corolla tube it is found in the parenchyma surrounding the vessels. In the leaf the alkaloid was found in the phloem parenchyma and in the mesophyll. In the stem it was found in the parenchyma, the sieve tubes, pith, cortex and wood. In the root the alkaloid was present in the cork layer, the phellogen, phelloderm, phloem parenchyma and pith rays.

In germinating seeds the alkaloid was found in the cotyledons, then in the stalk, the bases of the leaves, then in the entire plant. It appears greatest at flowering time and decreases thereafter.

Since the pith of the flower stalk is richest in alkaloid it is thought that its formation is not dependent upon light. This is contrary, however, to some other theories regarding the effect of light upon alkaloid formation.

Tröggelle states that the pollen is free from alkaloid and that the unripe seed is richer in alkaloid than the ripe seed. The pericarp decreases in alkaloid content during fruit formation and the endosperm and embryo are alkaloid-free. The alkaloids of seedlings arise through new formations. Von Anema and Clautriau, in working upon the seeds of *Atropa*, found the alkaloid between the integument and albumen but never in the albumen or the embryo.

The Solanaceous alkaloids offer good material for the study of the translocation of the alkaloids since they are not confined to any one part of the plant or to any particular tissue. It is thought, however, that they follow the conductive parenchyma. They are also found more abundant near wounded tissue which may strengthen the theory that alkaloids are not only destructive protein products but are also protective substances.

ATROPINE AND HYOSCYAMINE.

According to Putt¹⁸ there would be no necessity for tests for alkaloids other than color reactions if such reactions were always distinctive and satisfactory. In the first place, to get a good color reaction the alkaloid must be relatively pure. Again the amount of material required to perform a series of color tests is often many times greater than the entire available sample. Then, too, many colorations are due to the metallic nature of the reagent rather than to the alkaloid.

In microchemical tests with pure alkaloids Putt recommends the addition of $\frac{N}{10}$ hydrochloric acid before adding the reagent. If a precipitate fails use less reagent or more alkaloid. In all cases, except with iodine solution, use excess of the precipitant. If alkaloidal solutions are concentrated the precipitate is at first amorphous and forms crystals slowly, if dilute, crystals form at once.

REAGENTS.

| 8. Phosphomolybdic acid solution. | 17. Alcoholic solution 50-75% and 95%. |
| 9. Tannic acid solution, 10%. | |

REAGENTS AS REPORTED AND COLLECTED FROM MANY SOURCES.

- Atropine with $\frac{N}{10}$ Iodine solution first gives a field of minute red, oily globules, which soon form minute crystals of fairly uniform size, with a tendency to form small clusters.
- Atropine with platinic chloride gives an amorphous precipitate.
- Atropine with gold chloride forms a precipitate of yellow drops which crystallize upon standing. Behrens says this reaction has no value for microchemical analysis.
- Alkaloids with simple solution of iodine give a reaction which may be aided by the use of hydrogen peroxide. In this reaction iodoatropin is formed.
- Atropine with acid chlorine water or hydriodic acid solution gives a brownish precipitate which collects in oily drops, which form monoclinic prismatic crystals in 5 or 10 minutes with yellowish brown to straw-yellowish color. The hydrochloride crystals are 30-60 μ and sharply defined with extinction angle of 20° 30'. The hydroiodide crystals are less well formed prisms and are colorless to dark yellow.
- Atropine with tartaric, oxalic, citric, chromic, and sulphuric acids, crystallizes into short, rhomboid, irregular, six-cornered crystals. With acetic acid and nitric acid spear-like, arrow-pointed crystals develop, often forming oblique crosses. All these salts have a reddish brown coloring, and weak polarization. Of these the nitrates give the most conspicuous and well-formed crystals (Behrens).
- Atropine salts in neutral solution form a bluish precipitate with iodoplatinate.
- Atropine from alcohol crystallizes in needle-like crystals, often spear-like and in star-shaped rosettes.

9. Hyoscyamine will crystallize from alcohol in about the same manner as atropine.
10. Many alkaloids are precipitated by a neutral solution of uranium acetate, first as amorphous, then becoming crystalline. Such crystals are insoluble in alcohol and water (J. Alloy).
11. Atropine crystallizes from aqueous alcohol into prisms (Perkin and Kipping).
12. Section of *Atropa belladonna* to which a solution of iodine and potassium iodide has been added after a time gives starlike crystals with a metallic appearance (Molisch).
13. Atropine with solution of iodine and potassium iodide give dark violet-brown crystals with a double refraction but hard to see on account of dark color. Hyoscyamine gave a light brown crystal which showed a distinct double refraction (Feldhaus).
14. Alkaloids give distinctive crystals with saturated solution of picrolonic acid (Schmidt 25).
15. Alkaloids form yellow precipitate as alkaloidal picrates with picric acid.
16. Atropine with phosphomolybdic acid gives a yellowish precipitate (Tunmann).
17. Potassium mercuric iodide gives a whitish precipitate that is hard to see (Tunmann).
18. Bromine water gives small crystals or yellow amorphous lumps (Tunmann).
19. Sections of tissue treated with gold chloride or potassium mercuric iodide then washed with hydrogen sulphide solution, will give a black coloring of the alkaloidal cells (Barth).
20. Crystals of atropine sulphate, chromate, and nitrate are a dark brown color with a strong silvery gleam in reflected light (Behrens).
21. Sodium bicarbonate will not cause a precipitate of atropine from solution except upon long standing (Behrens).

MICROCHEMICAL TESTS UPON ATROPINE, HYOSCYAMINE AND UPON THE ALKALOIDS IN DATURA.

Microchemical tests were made upon atropine and hyoscyamine because they largely represent the alkaloids of the Solanaceae. *Datura* was selected as the plant for our studies because it contains the alkaloids desired and is easily obtained.

TESTS.

1. Atropine was found to crystallize from solution in absolute alcohol into fan-shaped, feathery-like crystals.
2. Atropine treated with a solution of iodine and potassium gave a precipitate with a yellowish color, which soon formed needle-like crystals (*a*—upon long standing only crystals of potassium iodide remained, *b*—the same test was made adding a little potassium nitrate solution but plate-like crystals formed indicative of the nitrate together with formation of starlike needles and feathery atropine crystals).
3. Atropine was treated with iodine and potassium iodide solution to which a little hydrogen peroxide had been added. Fan-like feathery crystals together with needle-like crystals in clusters appeared. The addition of hydrogen peroxide seemed to hasten the formation of crystals. Crystals of an entirely different kind resulted when the test was made without the alkaloid.
4. Atropine with HCl and gold chloride gave a precipitate of oily globules which, after a few moments, formed large feathery fan-like crystals, quite stable upon exposure to air.
5. Atropine with hydrochloric acid solution to which iodine potassium iodide was added formed a precipitate of reddish brown globules, which accumulated near the edge of the coverslip and after a few moments formed long, clear crystals and many in rosettes.
6. Hyoscyamine hydrochloride solution treated with iodine and potassium iodide formed a yellowish precipitate which at once formed pale yellow to brownish triangular-shaped crystals. A few were narrower and formed rosettes.
7. Hyoscyamine hydrochloride solution treated with gold chloride gave a yellowish precipitate of oily globules which, after a few moments, formed irregular plate-like crystals.
8. Sections of *Datura* with hydro-alcohol in many cases resulted in the formation of star-like and needle-like crystals as described for atropine. This test cannot be controlled sufficiently to confirm the crystals as atropine.
9. Section of *Datura* treated with gold chloride, iodine and potassium iodide, picric acid, uranium acetate, picrolonic acid gave negative results concerning the presence of alkaloids.

DISCUSSION.

In many of the reported tests for these alkaloids, the work has been done upon the alkaloids as groups. Many of the microchemical reactions are reported upon the basis of the pure alkaloid with no confirmation upon the same results by working with plant tissues. The fact that other plant products are precipitated with these reagents makes the detection of the presence of alkaloids in a cell very uncertain, unless confirmatory tests can be made.

In numerous tests upon sections of roots, stems and leaves of *Datura* we have been able to obtain crystals, corresponding to atropine or hyoscyamine, by treating the sections with hydrochloric solution. Our efforts to prove that such crystals were atropine by use of alkaloidal reagents failed to prove successful, and in each case the crystals found by use of hydro-alcohol were lost when iodine potassium iodide or any other of the reagents suggested was used, but in one or two cases were recovered by hydro-alcoholic solution though in lesser quantities. We believe this was due largely to the presence of much other material in the tissue that tends to take up or possibly disguise the alkaloidal precipitate which undoubtedly, if present, was only in minute quantities.

In our work further we found that atropine crystals were just as readily obtained from sections which had remained in water for 24 hours as from freshly cut sections. Behrens suggests that such tissue should not be allowed to remain in water.

Regarding the localization of these crystals which we termed atropine, they were usually found in the parenchyma cells. If they had any connection or relation to calcium oxalate crystals or cells containing calcium oxalate we were unable to detect it.

These crystals that formed upon treating the sections with hydro-alcohol were markedly distinct from any other crystals in the tissues. They appeared as needle-like crystals pointed at both ends usually; sometimes these appeared as sheaf-like. These crystals while quite regular varied in size in various sections.

CONCLUSIONS.

From our studies we are led to conclude:

1. That alkaloids free from vegetable tissue give microchemical reactions of a very characteristic nature with many of the alkaloidal reagents.
2. That alkaloidal reagents applied to plant tissues, precipitate substances other than alkaloids, making the detection of the presence of alkaloids very difficult.
3. That the reagents that form crystalline precipitates are more satisfactory than those forming amorphous precipitates.
4. That the application of reagents must be made with care, avoiding the use of excess amounts of same because a precipitate cannot be seen if the solution is too dilute.
5. (a) That the most successful reagent with plant tissues containing atropine is hydro-alcohol; (b) the best results with the pure alkaloids were obtained with alcohol, and solutions of gold chloride and iodine and potassium iodide.
6. That it is possible to determine alkaloid crystals in plant tissue by the use of the polarization microscope.

UNIVERSITY OF CHICAGO.

EUPATORIUM GLUTINOSUM LAM., AN ADULTERANT OF MATICO, N. F. (PIPER ANGUSTIFOLIUM RUIZ ET PAVON).*

BY CLARE OLIN EWING AND JOSEPH F. CLEVINGER.

NOTE.—During the course of the supervision of crude drug inspection, the Pharmacognosy Laboratory frequently examines new or unusual products, which are of such general interest that it seems advisable to make note of them from time to time. This is especially true at the present time when the unsettled war conditions have demoralized the ordinary channels of trade. With the resulting higher prices there has been a tendency toward increased substitution in the cases of crude drugs which are only obtainable with difficulty.

In the past, references to such products have been included in reports submitted to the American Pharmaceutical Association or the Association of Official Agricultural Chemists, or published by the Chief of the Bureau of Chemistry in his Annual Report, or as separate Press Notices or items appearing in the *Service and Regulatory Announcements* of the Bureau. It is now proposed to publish somewhat more detailed notes regarding adulterants, substitutes, or new products which appear of sufficient importance to justify more extended notice than can be accorded them in the brief reports of publications above referred to.—A. VIERHOEVER.

Among recent adulterations which have come to our attention is one which is especially noteworthy, because of the fact that it illustrates how errors may arise through application of unspecific common names to medicinal plants.

The material in question was offered for importation as "Matico Leaves," a

* Contribution from the Pharmacognosy Laboratory, Bureau of Chemistry, Department of Agriculture, Washington, D. C.

drug obtained from *Piper angustifolium* Ruiz et Pavon (family *Piperaceae*), a plant indigenous to Peru and Bolivia. Examination of the sample showed it to have been derived from another plant growing in the same regions, namely, *Eupatorium glutinosum* Lamarck,¹ a plant belonging to the family *Compositae*. Dragendorff² mentions it as one of the matico plants. Wijk³ refers to it as the "Matico of the Peruvians." The National Standard Dispensatory⁴ also states that among "other leaves to which the name (Matico) has been applied are those of *Eupatorium glutinosum* * * *"

At a first glance the leaves have an appearance somewhat resembling those of matico, due to the fact that both species have leaves scabrous and bullate on the upper surface, but comparison with authentic material readily discloses obvious differences. The leaves of *Eupatorium glutinosum* pack together in rather a gummy, spongy fashion, and are much less brittle than those of the recognized matico. The following tabulation shows the most striking characteristics wherein the sample differed from authentic matico:

| Matico. | Matico substitute. |
|---------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <i>Piper angustifolium</i> Ruiz et Pavon. | <i>Eupatorium glutinosum</i> Lam. |
| Leaves: | Leaves: |
| Alternate. | Opposite. |
| Margin finely crenulate. | Margin serrate. |
| Base unequal, oblique, subcordate. | Base cordate. |
| Venation palmate-pinnate, prominent below. | Venation pinnate. |
| Upper surface scabrous and finely bullate. | Upper surface scabrous and coarsely bullate. |
| Lower surface pubescent; simple hairs; glandular hairs absent. | Lower surface very wooly, due to numerous, long, simple, much twisted hairs; numerous short glandular hairs. |
| Subsessile or short-petiolate. | Petiole one to three cm. long. |
| Length ten to twenty cm. | Length five to fourteen cm. |
| Breadth two to five cm. | Breadth one to three cm. |
| Flowers: | Flowers: |
| Long spikes. | Cymose-paniculate composite heads. |
| Fruit: | Fruit: |
| Drupe, reddish brown; containing reddish brown and distinctly reticulate seeds. | Achene; five-angled, truncate; pappus of numerous capillary scabrous bristles. |

Inasmuch as we have been unable to find any data in the literature regarding the chemistry of *Eupatorium glutinosum*, the following data obtained with the meager material at our disposal may be of interest:

The amount of extract yielded to petroleum ether was about 14 percent. This is a large percentage for a leaf drug and, together with the large number of glandular hairs, affords an explanation of the manner in which the sample packed together.

While the presence of alkaloids has never been positively reported in any species of *Eupatorium*, Shamel⁵ reports some inconclusive tests for the presence

¹ *Encyclopédie Méthodique Botanique*, 11 (1876), 408.

² *Heilpflanzen* (1898), 9, 661.

³ *Dictionary of Plant Names*, 1911, 1, 521.

⁴ Hare, Caspari, Rusby: *National Standard Dispensatory*, 1916, 1007.

⁵ *American Chemical Journal*, Vol. 14 (1892), 224.

of an alkaloid in the related species *Eupatorium perfoliatum*. Tests for alkaloids made upon a 5 gramme sample of our material, using Wagner's and Mayer's reagents, gave negative results.

Tannins have been reported in a number of *Eupatorium* species and inasmuch as astringent and haemostatic properties are reported for the recognized matico, it was thought that the presence of tannin in the leaves of *Eupatorium glutinosum*, and their consequent use for similar purposes, might account for the term "Matico" having been applied to them. However, not more than a mere trace of tannin could be detected in an aqueous extract from 25 grammes of the powdered leaves.

FIG. 1.—EUPATORIUM GLUTINOSUM LAM.

A. Inflorescence. B. Upper surface of leaves; C. Lower surface of leaves.

The taste and flavor of the leaves did not closely resemble those of the recognized matico. A steam distillation showed the presence of about 0.15 percent of a volatile oil resembling in odor that of boneset (*Eupatorium perfoliatum*) of the National Formulary IV (1916). When heated, the oil had a strong odor reminiscent of acetic and a higher fatty acid. It is of interest in this connection that Miller⁶ reports the presence of acetic and probably another higher fatty acid in the volatile oil of *Eupatorium capillifolium* (Lam.) Small. Unfortunately, the amount of material available was insufficient to obtain the amount of oil necessary for further work.

AN IMPROVED APPARATUS FOR TESTING THE ACTIVITY OF DRUGS ON THE ISOLATED UTERUS.*

BY PAUL S. PITTENGER.

The importance of biologic assay methods as a means of securing uniformity in the action of drug preparations not amenable to chemical standardization is just beginning to be fully appreciated. The incorporation of a chapter on "Bio-

⁶ "A Chemical Study of the Oils of Several Species of *Eupatorium*," E. R. Miller, University of Wisconsin, *Bull.* No. 693, p. 1-41 (1914).

* Read before the Scientific Section, A. Ph. A., Indianapolis meeting, 1917.

logic Assays" in the present ninth edition of the U. S. P. is an epoch in the history of standardization and it is to be hoped that with this start a much wider publicity and experience will be gained so that the next Committee of Revision will readily be able to select from the proposed methods and make official the methods which prove to be the most satisfactory and convenient for each drug. Many methods used for the biologic standardization of drugs are not new but merely *quantitative* applications of methods used to elucidate the drugs' physiologic action. The principal task of the biologic chemist, therefore, is the selecting of the most suitable method for the particular drug under consideration.

Second in importance to the selection of the most suitable methods for this work is the *selection and improvement of the apparatus* employed. This is particularly true in experiments upon isolated organs where it is necessary to simulate the normal conditions within the animal from which the organ has been excised. Very often the importance of details of apparatus employed has been lost sight of and only too frequently have papers been written criticizing or condemning methods because concordant results could not be obtained when in fact the principal cause of the non-concordant results was not a faulty method but a *variation in the apparatus employed or in the inexperience of the operator*.

Frequently one operator will read an article on the assay of a particular drug or preparation in which the author of the paper gives detailed descriptions of the apparatus as well as the method employed and without going to the necessary expense and labor of duplicating the author's apparatus will carry out the test suggested on the nearest "thing" which happens to be in the laboratory. After a possible eight or ten experiments a marked variation is found in the results obtained and a paper is written criticizing the original method when in fact due to the difference in apparatus employed the experimenter has never really carried out the original method or performed enough experiments to become sufficiently experienced to pass an opinion upon the subject.

The above comments particularly apply to apparatus employed in making tests upon the isolated uterus. For example, the author in two different papers¹ as well as in his text-book on *Biochemic Drug Assay Methods* describes in detail and recommends an apparatus and method for making *quantitative* determinations of the action of drugs on the isolated uterus. These articles all state that the particular advantage of the apparatus described lies in the fact that the interference with the test produced by spontaneous contractions and increased sensitiveness of the uterus are practically overcome by replacing the Harvard light muscle lever, which was generally employed for recording uterine contractions, by an *escapement wheel and stylet* and the use of the *entire one horn* of the uterus in place of a segment; the free end of the uterus to be attached by means of a silk thread to one side of the wheel while from the other side is suspended a counterpoise bucket for holding shot. It was further explained that "By adding the proper amount of shot to this bucket the operator is enabled to weight the uterus down and thus reduce the amplitude of the spontaneous movements so they can

¹ "The Application of Some Muscular Tissues Adapted to Physiological Standardization" *Monthly Cyclopedic and Medical Bulletin*, Sept. 1913.

"A New Uterus-Contracting Method of Testing Ergot, with Comparison with the Blood-Pressure Method." *JOURNAL A. PH. A.*, July 1914.

be controlled. Thus, the marked spontaneous contractions can be reduced until the uterus is just able to contract under the increased load or, in other words, shot is added until the maximum amount of work that the uterus is normally capable of performing is counterbalanced. Any increase in the amplitude of the contraction after the addition of a given drug can now be produced only by that drug." It was also suggested that the uterus be suspended in a cylinder containing about 250 mils of Loche's solution.²

Several workers later claimed that Pituitary Extract could not be satisfactorily assayed by the uterine method because of marked spontaneous contractions present normally in many uteri and of the increased sensitiveness after a few doses of the drug. After an investigation the writer discovered that the authors of these criticisms had employed the "old style" isolated uterus apparatus consisting of a Harvard light muscle lever and a muscle warmer of about 40 mil capacity when the link between success and failure in carrying out *quantitative* tests upon the isolated uterus lies in the use of an *escapement wheel and bucket* for shot and the suspension of the entire one horn of the uterus in a relatively large quantity of Loche's solution preferably about 250 mils.

The above comments are made before describing the apparatus which forms the subject of this paper in order to bring out the point that in biologic assays where the most accurate *quantitative* results are desired it is just as essential to pay attention to details and strive to improve the apparatus as it is to improve the methods themselves. The form of apparatus recommended for a particular test is as much a part of the method as the animal employed.

Fortunately, in the majority of cases the foregoing statements do not apply to workers who have given the subject serious thought and have devoted a considerable amount of time to practical experimental and research work, in an endeavor to improve and determine the limitations of the various methods proposed, but to those who devote practically all of their time to allied subjects and merely dabble in biologic standardization.

The former all agree that wonderful strides have been made within the last few years and that the value of physiologic standardization as a means of securing *uniformity* in the strength of drugs and their preparations can not be over-estimated. The importance of this work is admirably set forth by Vanderkleed³ in the following words:

"Is it after all so necessary, so important, that preparations of digitalis, ergot, pituitary, etc., be standardized? In answer to that I would only say that we must all agree that it is the duty of our profession to render the best service to humanity of which we are capable. Now if we did not know that preparations of potent drugs like digitalis, strophanthus, ergot, etc., vary hundreds of percent in activity, when prepared indiscriminately and without physiologic control, we might be justified in continuing to market such variable products with the hope that after all the physician will be able to feel his way—and in many cases succeed in hitting the bull's eye, even with the handicap of poor weapons. But now that, thanks to pharmacodynamic investigation, we do know that digitalis tinctures or ergot fluidextracts may, and often do, without such control, vary

² "Biochemic Drug Assay Methods," pages 73 to 82.

³ "Physiologically Standardized Pharmaceuticals," by C. E. Vanderkleed, read before Ohio Pharmaceutical Association, July 1916.

all the way from practical inactivity to several times the normal strength, I personally feel that I could never conscientiously send out any such preparations unless I knew it had been physiologically tested and standardized."

It is gratifying to note that practically all objections made to physiologic assay methods are of the same general order, *i. e.*:

"Is the sample of drug that has been found to possess the greatest power to kill a cat the one that will prove the most efficient in curing a man?"

"Is the physiologic effect of the drug that is measured the one that gives it its therapeutic value?"

"The result of the assay depends upon *toxic* effects."

"The animal chosen is biologically much different than man."

"How can we calculate from the amount of drug necessary to produce a certain effect upon a dog how much will be required to produce the same effect upon man?"

The above questions clearly indicate a lack of conception on the part of these critics of the real purpose of the physiologic test, namely, to secure *uniformity*. The determination of the real value of a drug in the treatment of disease in man is another matter entirely. It is not the object of Biologic Standardization to attempt to show from the effect of a certain drug upon the cat how it will act upon man; or to calculate from the amount of drug necessary to produce a certain effect upon the dog how much will be required to produce the same effect upon man; or from the amount necessary to kill a guinea-pig how much will kill a man. These are all questions which concern the experimental physiologist and not the physiologic assayist except indirectly. Biologic assays are recommended in the U. S. P. IX only for drugs of *well-known physiologic effect and therapeutic efficiency*. It is not the object, therefore, to attempt from the results of our experiments on cats or dogs to tell the practitioner how these drugs will act on man because he knows the effects of these drugs from the results of thousands of clinical tests *on man*. Neither is it the intent to tell the practitioner how much tincture of digitalis, for example, will be required to produce a certain effect on man from the amount which produces the same effect on frogs or guinea-pigs because the practitioner's experience has taught him the proper dosage of these well-known drugs. As before stated, the sole object of biologic assaying is to devise and perfect methods whereby it is possible to produce *uniform* preparations. Therefore, if we always adjust a preparation to the same strength upon the same animal it will always produce the same effect upon man regardless of the relation between the two. Obviously, however, some more or less definite ratio must be shown to exist between the result obtained from the physiologic test and the therapeutic activity of the preparation, but to claim that because a frog is not comparable to a man, it should not be employed in physiologic testing, is as illogical as to deny that a chemical assay is of value because a chemical balance and a set of weights are not related to the human circulatory system.

To return to the subject of the paper, the author in his text-book and two papers previously mentioned describes in detail an apparatus and method for testing the activity of drugs upon the isolated uterus. A brief description of this apparatus follows:

The uterus is suspended in about 250 mls of Loche's solution contained in a cylindrical glass vessel (*G*) (Figure 1), the lower end of which is plugged with a rubber stopper (*O*) having a central bore. Through the latter passes one arm of a

wide glass "T" tube (*I*) which ends flush with the upper surface of the stopper, so that the cylindrical vessel may be completely emptied. This tube passes through a second rubber stopper (*L*) which fills an opening in the bottom of an outer metallic vessel (*F*) which forms a constant temperature water jacket.

The temperature of the water in the jacket is kept constant by means of a metallic rod (*E*) which penetrates the wall of the jacket, passes through the water, and is soldered to the opposite side of the jacket. The portion of the rod external to the jacket is heated by a protected Bunsen burner (*C*) which slides on the rod. The temperature is regulated by sliding this burner backward and forward until that point is reached where the amount of heat transmitted by the rod to the water inside is sufficient to keep the thermometer (*T*) suspended in the water at the proper degree (38° to 39° C.).

FIGURE 1. —A graphic drawing of the original apparatus and will serve to illustrate the description given in text. —From Pittenger's "Biochemic Drug Assay Methods."

One of the other arms of the "T" tube is connected by a rubber junction (*X*) armed with spring clamps (*S*) to a waste pipe by which the cylindrical glass vessel may be emptied.

The remaining arm is connected by a syphon tube (*P*) to a flask (*B*) which holds a small amount of Loche's solution for refilling the cylindrical vessel. This flask is kept at a temperature between 40° and 45° C. by means of a steam bath (*Z*). The main supply of Loche's solution is contained in a large aspirator bottle (*A*) connected with the small flask by a rubber tube (*H*), the object being to avoid exposing the reserved solution to prolonged heat. Heat causes Loche's solution to gradually decompose and lose CO_2 .

The Loche's solution in the small flask should be reduced to 39° C. immediately before admitting it to the cylindrical vessel by allowing sufficient cold solution to run into it from the aspirator bottle.

Into the cylindrical vessel containing the Loche's solution dips a narrow glass tube (*Y*). This tube is turned at right angles about half an inch from its lower end. Into this is sealed a platinum pin (*N*) for attaching the *lower end of the isolated uterus*. The upper end of this tube is connected by means of rubber tubing (*P*) to an oxygen reservoir (*R*). A constant stream of oxygen is allowed to bubble through a small vent at the lower end of the tube, thus preserving the muscular irritability of the uterus and at the same time stirring the Loche's solution.

The other end of the uterus is fastened to a small platinum hook (*I*) connected to a silk thread (*V*) which passes over an escapement wheel (*H*) and is attached to a pin on the opposite side of the wheel. A counterpoise bucket for holding shot (*U*) is attached to the opposite side of the wheel. To this wheel is soldered a stylet of aluminum (*K*), the axle of the wheel serving as a fulcrum. To the end of this stylet a pen point is fixed (*Q*) for recording the contractions of the uterus on the revolving drum of the kymograph.

FIGURE 2.—Improved apparatus for testing the activity of drugs upon the isolated uterus.

This apparatus was in continuous use in the laboratory for two and a half years and gave very satisfactory results in testing Ergot and Pituitary Extracts. During this time, however, its limitations were carefully studied with the result that several details were noted in which marked improvements could be made.

First. The uterus was subjected to more or less shock at times due to the fact that it was impossible to always have the temperature of the Loche's solution in *B* at exactly 38° C. the instant it was necessary to use the same for refilling *G*. It was thought advisable, therefore, to make the constant temperature bath *F* of sufficient capacity to accommodate the bottle containing the warm Loche's solution for refilling *G*. With this stock solution in the same water bath as the cylinder containing the uterus it must necessarily be of the same temperature and thus produce no shock to the uterus when the drugged solution is run off and fresh solution run in.

Second. The metal tank was replaced by glass which enables the operator to observe to a better advantage the rate at which the oxygen is flowing, the amount of solution in stock bottle and the temperature of the bath.

Third. The brass rod and bunsen burner for heating the water in bath was replaced by an electric immersion heater, the temperature of the water being automatically regulated by means of a toluol-mercury thermostat or an Eberbach Bimetallic electric thermo-regulator.

Fourth. The escapement wheel was improved so that the writing point can be raised or lowered without destroying the tension on the uterus or changing the clamps on the stand.

Fifth. An elevator was added to accommodate two aspirator bottles of water for furnishing air pressure to force the Loche's solution from the stock bottle into the cylinder containing the uterus.

FIGURE 3.—Graphic drawing showing the arrangement of apparatus within the constant temperature bath and method of connecting batteries (B), condensers (C) and relay (S) with the thermo regulator (7) and heater (H).

The complete improved apparatus is shown in Figure 2. Figure 3 is a graphic drawing showing the arrangement of the stock bottle, thermostat, heater, cylin-

dricul vessel and stirrer, within the constant temperature bath. The labeling of corresponding parts is the same in both figures and will serve to illustrate the following detailed description:

The uterus is suspended in about 250 mils of Loche's solution contained in a cylindrical vessel (1), the lower end of which is plugged with a rubber stopper (2) having a central bore. Through the latter passes one arm of a wide glass "T" tube (3) which ends flush with the upper surface of the stopper, so that the cylindrical vessel may be completely emptied. This tube passes through a second rubber stopper (4) which fills an opening in the bottom of the outer glass vessel (5) which, when filled with water, forms a constant temperature water bath.

The water in the bath is heated by means of a "Universal" electric immersion heater (6). The temperature of the water is automatically kept at 38° C. by means of a toluol-mercury regulator (7) which makes and breaks the circuit from the batteries (B) to the relay (8) which in turn makes and breaks the electric current (110 or 220 volt) from plug (9) to the heater. The heat is evenly distributed throughout the water by the stirrer (10) which is driven by a small water or electric motor. The condensers (C) are used to prevent sparking when the relay (8) makes and breaks the electric current and thus prevents the contacts from burning off. For a 110-volt circuit only one condenser is necessary.

One of the other arms of the "T" tube is connected by a rubber junction (11) armed with a spring clamp (12) to a waste pipe by which the cylindrical glass vessel may be emptied.

The remaining arm is connected by rubber tubing (13) to one branch (14) of a "3-way" stopcock (15). One of the other branches of the stopcock passes through a rubber stopper (16) which fills an opening in the side of the glass water jacket. The end of this branch projects on the inside of the water jacket and is connected by means of a rubber tube (17) to the outlet of aspirator bottle (18) which contains unmedicated Loche's solution. Therefore, when the stopcock is turned to the proper position the unmedicated solution from the aspirator bottle (18) is forced through the connections just described by air pressure into the cylindrical vessel (1) containing the uterus.

The air pressure is supplied by allowing water to flow from an elevated aspirator bottle (19) through rubber tubing (20) into lower aspirator bottle (21). The air thus compressed above the liquid in the lower aspirator bottle is lead by means of pressure tubing (22) to the one branch of a "3-way" stopcock (23). One of the other arms of the stopcock (24) passes through a rubber stopper which tightly fits into the neck of the aspirator bottle (18) containing the Loche's solution. The remaining arm (25) of stopcock (23) permits air to escape when aspirator bottle (18) is refilled from flask (26) on steam-bath by means of siphon tube (27).

It will be noted, therefore, that when stopcocks numbers (15) and (23) are turned to the proper position the air pressure passes through stopcock (23) and forces Loche's solution from bottle (18) through tubing (17), stopcock (15) and tubing (13) to cylindrical glass vessel (1) containing the uterus. When the two stopcocks are turned in the opposite direction the Loche's solution in flask (26) siphons through tubing (27), stopcock (15) and tubing (17) and refills bottle (18) while the air in (18) escapes through stopcock (23).

The flask on the steam bath (29) is kept at a temperature between 40 and 45° C. A supply of Loche's solution is kept in the large aspirator bottle (28) connected with the flask by a rubber tube armed with a screw clamp, the object being to avoid exposing the reserved solution to prolonged heat. The Loche's solution in the flask is reduced to approximately 39° C. before siphoning into bottle (18) where the water bath adjusts it to exactly 39° C.

The neck of the large aspirator bottle is closed by a tight-fitting rubber stopper, through which pass two glass tubes. The one tube (30) is connected with a 20,000 mil bottle underneath the table which contains the reserve sterile Loche's

solution while the other (31) is connected with a water vacuum pump. Thus, by merely turning on the water to the pump the large aspirator bottle (28) is refilled with the sterile solution from the reserve bottle underneath the table without exposing the same to the air.

The method of suspending the uterus, supplying the oxygen and recording the contraction, are the same as with the original apparatus (see page 515) except that a marked improvement has been made in the construction of the escapement wheel.

It often happens that after suspending a uterus in the oxygenated Locke's solution it will relax to a greater extent than was expected by the operator and the writing point will fall below the smoked paper. Occasionally a uterus will make apparently normal contractions and react readily to the drug, but after two or three doses will suddenly relax to a much greater extent and establish a new normal far below the original. It is not convenient to lower the paper on the double drum kymograph to bring the writing point into proper position.

In the above cases it was necessary, therefore, with the original apparatus, to either shorten the thread which attaches the uterus to the wheel or to lower the tube to which the lower end of the uterus is attached. Both of these methods destroy the tension on the uterus and spoil the tracing.

The wheel on the improved apparatus consists of two parts (*A* and *B*, Figure 4). (*A*) is soldered to the axle while (*B*) is free and may be rotated independent of the axle. The stylet and writing pen are also soldered to (*A*). In (*B*) there is a

FIGURE 4.—Shows the construction of the improved escapement wheel. 1. Side view. 2. Front view.

crenate-shaped perforation (*C*) through which passes a small rod. The one end of this rod is soldered to (*A*) while the other end is threaded and supplied with a thumb nut (*D*) which when tightened acts as a set screw and holds *B* in any desired position. *A* is also supplied with a series of small pegs (*E*) which support the thread holding the bucket for shot. The rim of (*B*) contains a small groove (*F*) in which the thread from the uterus passes around the wheel. The end of this thread is fastened to a small peg (*G*).

This construction makes it possible, by simply loosening the thumb screw and holding (*B*), to rotate (*A*) and thus raise or lower the writing pen without moving (*B*) or disturbing the tension on the uterus. After adjusting the pen to the desired position the thumb screw is tightened and the wheel again acts as if it were constructed of but one piece.

Figure 5 shows the construction of the toluol-mercury thermostat. That portion of the glass tube which is lightly shaded represents toluol (*I*) and the black

portion (2) represents mercury. The platinum point of battery wire (6) is so arranged that it may be raised or lowered through stopper (9) and is connected directly with the zinc pole of the dry batteries. The platinum end of battery wire (5) is constantly in contact with the mercury and the other end is connected to one "battery pole" of the relay. The other "battery pole" of the relay is connected with the carbon pole of the batteries thus completing the circuit when the relay is closed. The relay must be of the type which breaks a contact when the battery circuit is closed by the thermostat and makes the contact when the battery is broken. The switch (S) in Figure 3 is to disconnect thermostat when not in use in order to save batteries.

In order to adjust the thermostat so that it will throw the relay at a given temperature, say, for example, 39°C. , it is only necessary to place the bulb (1) in the water bath, bring the temperature of the water to exactly 39°C. and adjust battery wire (6) so that it merely touches the surface of the mercury. After connecting with the relay, condensers and batteries, this apparatus will then automatically keep the water in the bath at a uniform temperature of 38.5 to 39°C. as follows:

Arrange the apparatus as shown in Figure 3; regulate thermostat as already outlined under Figure 5; start stirrer (10); close switch (S) and insert plug (9) in socket.

The heater produces a gradual increase in the temperature of the water which causes the toluol in the thermostat to expand and the mercury to rise. When the temperature of the water reaches exactly 39°C. the mercury touches the platinum point of wire (6), which completes the battery circuit and allows the current from the batteries to run through the coil of the relay, thus forming an electro magnet which lifts the armature of the relay and in turn breaks the contact which stops the strong current from passing to the heater from socket (9).

With the gradual lowering of the temperature of the water the Toluol contracts and causes the mercury to fall away from the platinum wire (6), thus breaking the battery current which is passing through the relay. This break allows the armature of the relay to fall away from the magnet and make the contact which allows the strong current to again pass from the socket to the heater. The heater gradually increases the temperature of the water until at 22°C. the mercury in the thermostat again makes a contact and the whole operation repeats itself. The toluol-mercury regulator, relay and batteries may be replaced, if desired, by an Eberbach bimetallic electric thermo-regulator.

The aspirator bottles (19 and 21) for furnishing air pressure are of eight-liter capacity and are placed in the small boxes which form the carriages of the elevator which may be raised or lowered by means of a rope passing over pulleys

FIGURE 5

FIGURE 6.—Shows method of connecting thermostat (7); relay (8); condensers (C); batteries (B); switch (S) and heater (6) with the electric plug (9)

underneath the table to an awning cleat (Figure 2, 33) which serves to hold the elevators at any desired position. The method of connecting these bottles and carrying the air pressure to the small aspirator bottle in the water bath is shown by Figure 7.

FIGURE 7.—Shows method of connecting aspirator bottles for making air pressure.

It will be noted that each bottle is closed by a rubber stopper containing two holes. One hole of each stopper is fitted with a glass stopcock (A and A-1) while through the other hole of each stopper passes a glass tube which in turn is attached to rubber pressure tubing (22 and 32) leading to two arms of a "three-way" stopcock (B). The other arm of the stopcock is connected by pressure tubing (Figs. 2, 3 and 7, 22) with the small aspirator bottle in the water bath.

The pressure tubes (22) and (32) are fastened to the wall at a point (C) midway between the upper and lower bottle and are of sufficient length to permit the free movement of the bottles from the upper to the lower position.

With the above arrangement the stoppers may be "wired in" and when all the water has passed from the upper to the lower bottle it is only necessary to reverse the position of the two bottles and the three stopcocks. The stopcock in the upper bottle should be open and the one in the lower bottle should be closed. The "three-way" cock should be turned so that the tubing (22) is in direct connection with the air pressure in the lower bottle. With the old method in which the neck of the lower bottle alone is supplied with a stopper and tubing it was necessary to change the stopper and tubing from one bottle to the other each time the positions of the bottles were reversed.

In conclusion, I would state that when an *escapement wheel and counterpoise bucket*, as described in Figure 4, is employed and the *entire one horn* of the uterus is used much more active quantitative results are obtained than when only a slender segment is taken and attached to a light heart lever.

FIGURE 8.—Illustrates the variation in muscular structure in different uteri. The above uteri were all taken from guinea pigs weighing from 280 to 320 grams.—From Pittenger's "Biochemie Drug Assay Methods."

Only sensitive uteri, however, should be employed as different uteri vary greatly in their mutual relation and to power and muscular structure (see Figure 8). Some specimens are greatly deficient in muscular substance and act feebly while other specimens show greater muscular development and contract strongly. Some specimens prove absolutely inert and will not respond at all. The normal activity, however, practically runs parallel with the amount of muscular tissue present; the "stringy" uteri like No. 1 (Figure 8) are all deficient in normal ac-

tivity and in response to stimuli, while the thick, more muscular uteri are practically all active and sensitive. This knowledge enables the operator to save considerable amounts of time, as it renders it possible for him to distinguish between active and inactive uteri before connecting them with the apparatus.

AUGUST 1, 1917.

WATER DROPS AND WATER DROPLETS.

BY A. B. LYONS.

There has been much discussion regarding a standard dropper for accurate measuring of small quantities of fluid. It has been shown that the size of the drop depends—other things being equal—on the diameter of the delivery tube at its orifice, and that when that diameter is 3 millimeters the dropper will deliver at standard temperature 20 drops of distilled water to the mil.

Obviously the usefulness of such a dropper would be very limited, since for different liquids, including aqueous solutions of different substances, the count of the drops per mil varies greatly. We have indeed occasion often in the laboratory to measure small quantities of a liquid by drops, but for such purpose we use an ordinary pipette, ascertaining by experiment how many drops per mil it will deliver of the particular liquid we propose to measure with it. Even so, we make our measurement only from the middle third of the pipette, or from the enlarged portion of the same.

In the use of such extemporized standard droppers we have been accustomed to keep in mind the effect of temperature on the size of the drops, using them only at temperatures not more than 5 degrees centigrade above or below that at which the dropper was standardized. Inasmuch, however, as the quantities measured in this way are never large, the effect of temperature, even in cases where the coefficient of expansion is large, is almost negligible as long as measurements are made at room temperature.

There is, on the other hand, an important possible cause of variation in the size of drops delivered from a pipette or dropper which has been very generally overlooked. This is *the character of the atmosphere in which the drop is formed*. The important factors governing the size (*i. e.*, the weight) of the drop are the surface tension of the fluid and the attraction between the fluid and the surface with which it is in contact. The first of these factors may be influenced enormously by the presence in the atmosphere of certain gases or vapors.

A few simple experiments will illustrate. Deliver into an empty flask from a pipette a certain volume of water, measured by the interval between two fixed lines on the pipette, counting the drops. Now put into the flask a little ether and repeat the count. The number of drops will be more than twice as great as in the first experiment. If the flask contains some strong alcohol the number of drops will be 25 or 30 percent greater than when it is empty, or contains only water. You are no longer getting standard drops, although the pipette is delivering the same fluid as before—contaminated at most with no more than a trace

of foreign substance. You may call them droplets if you choose, but as units of measure they have ceased to have value.

It is not necessary to go into detail, showing precisely how much variation is occasioned by this or that particular vapor. Little or no practical use could be made of such data. The important thing is to keep in mind the possibility of such disturbing influences in any use made of the dropper for exact measurements.

HYDROGENATED OILS AS FUTURE OINTMENT VEHICLES.*

BY ERNEST R. JONES.

INTRODUCTION.

For many years oil chemists had been searching for a simple means of changing oleic acid into stearic acid in order to convert relatively cheap raw material into more valuable fats.

While the matter would seem very simple because of the closeness of their empirical formulae, *i. e.*, $C_{18}H_{34}O_2$ or oleic acid and $C_{18}H_{36}O_2$ or stearic acid, a difference of only two hydrogen atoms, it was not until a suitable hydrogen carrier or catalyzer was found at the very close of the nineteenth century that the changing of oleic acid into the harder stearic acid was commercially accomplished. A German patent in 1901 is probably the first one recorded having to do with the reduction of organic bodies by hydrogen in the presence of nickel catalyzers. Since that time many improvements and patents have followed rapidly.

It is not the intention of this paper to go into the technique and processes used for the hydrogenation of oils and fats, but briefly, the process consists of converting a soft fat or oil into a harder one by causing the unsaturated acids or glycerides to take on more hydrogen. To do this the fat is heated in a suitable container to about $160^\circ C$. (temperature varies in different processes) a suitable catalyzer is added, usually a salt of nickel or palladium, or the finely divided metals themselves, and hydrogen is run in under pressure, the process being continued for several hours or until the desired degree of hardness is obtained. The catalyzer is then filtered out, the product cooled and is ready for use unless further bleaching or deodorizing is desirable.¹

CHEMISTRY OF PROCESS.

Although the hydrogenation process is essentially one of reduction it will be easier understood if we consider the new product as obtained by "addition." To

explain—the graphic formula for ethane is written
$$\begin{array}{c} \text{H} \quad \text{H} \\ | \quad | \\ \text{H} - \text{C} - \text{C} - \text{H} \\ | \quad | \\ \text{H} \quad \text{H} \end{array}$$
 The

graphic formula for ethylene is written
$$\begin{array}{c} \text{H} \quad \text{H} \\ | \quad | \\ \text{C} = \text{C} \\ | \quad | \\ \text{H} \quad \text{H} \end{array}$$
 It will be noticed that in the latter

* Read before Detroit Branch A. Ph. A., April meeting, 1918.

¹ For a more extended discourse on these processes see "Hydrogenation of Oils," by Ellis.

compound the linkage between the two carbon atoms is double whereas in the former compound the linkage is single. Compounds in which the linkage between the carbon atoms is single are called "saturated" compounds and can only form new compounds by "substitution," that is by substituting a different atom or group of atoms for one of the H atoms which is present.

A double bond or linkage in the structural formula of any compound, as in ethylene, is merely a convenient expression of certain facts which have been established experimentally, namely, that the compound is "unsaturated" and has the power of combining directly with certain other atoms or groups. In such cases the double linkage between the carbon atoms is changed to single and the new compound is said to have been formed by "addition."

Compounds which are unsaturated are the only ones then which are susceptible to hydrogenation. Thus its application to fats, now that suitable catalyzers have been found, is limited to those which contain unsaturated acids or glycerides.

Oleic acid, formula $\text{CH}_3(\text{CH}_2)_{14}\text{CH} : \text{CH}.\text{COOH}$, is a familiar example of an unsaturated acid. (Note the double linkage indicated by the two dots.) Therefore it is capable of being hydrogenated or converted into stearic acid, which is a saturated acid. The following equation represents the change which takes place:

From the molecular weights you will see that 282 pounds of oleic acid will yield 284 pounds of stearic acid by the addition of two pounds of hydrogen.

As the individual molecules of oleic acid are changed to stearic acid they of course exhibit the properties of that acid. The chief physical difference between oleic and stearic acids is that the former is a liquid and the latter a solid. If the process of hydrogenation is carried to completion, a hard, solid stearic acid would result on cooling, but as the process is entirely within our control we may stop it when any desired consistency has been obtained. This brings the possibility of using these fats for pharmaceuticals close to our own doors and one which we are not yet alive to the advantages obtainable. In pharmacy we have little use for either oleic or stearic acids, but the glycerides of the acids, namely, olein and stearin, are natural constituents of every fat or fixed oil we use in ointments, and this is where they seem destined for a great future use, in my opinion, as the glycerides can also be hydrogenated and thus yield us an entirely new set of ointment vehicles devoid of some of the objections of the present ones.

AN APPLICATION TO PHARMACY.

The most unsatisfactory ointment which pharmacists have to dispense is Zinc Oxide Ointment, U. S. P. In a paper, which I read before the A. Ph. A. convention in Detroit in 1914, it was plainly shown that the granulation and unsightly appearance of this ointment was due to the physical characteristics of the lard and could not be corrected. A hardened petrolatum vehicle was suggested and the Section on Pharmacopoeias and Formularies passed a motion suggesting that such a change be made in the U. S. P. IX formula for this ointment. The

sub-committee on ointments rejected the suggestion saying that "leading dermatologists favored the retention of the old formula." The reason was because benzoinated lard is absorbed by the skin, whereas petrolatum is not or only very slow. I doubt whether this ointment is intended to be absorbed when used, but that is a question of therapeutics which we will not consider at this time. If we can supply a substitute for lard, which will satisfy dermatologists from the standpoint of absorption and satisfy pharmacists at the same time, such a move would seem desirable to every fair-minded person. Such a thing can be accomplished with a hydrogenated cottonseed oil vehicle stiffened with wax as I have samples here to prove. These samples are all from two to four years old, have been kept at room temperature and are as perfect as when made.

It is not the intention of this paper to recommend any particular manufacturer's hydrogenated products, but as Crisco, a hydrogenated cottonseed oil, is quite a popular article particularly in the home, the experiments were conducted with that product. If such a product were marketed under a scientific name indicating its composition, it would, of course, be more desirable for our work. Also Crisco is a little too soft to replace lard entirely in our ointments and is open to the further objection that when melted alone it cannot be cooled to a smooth product by any practicable means. If the hydrogenation process were carried further these deficiencies could probably be eliminated. For this reason, I found it necessary to use wax to stiffen the ointments, which at the same time gives a smooth product.

The following formula is proposed:

| | |
|-------------------------------------------|---------|
| Zinc oxide..... | 200 Gm. |
| White wax..... | 125 Gm. |
| Hydrogenated cottonseed oil (Crisco)..... | 675 Gm. |

Melt the wax and hydrogenated cottonseed oil, add a small portion of the melted mixture and triturate with the zinc oxide till a smooth paste is obtained, then add the balance of the melted mixture and triturate till cool.

It may be found desirable to increase or decrease slightly the amount of wax, but this will be found out in time. Also it may be desirable to benzoinate the fat before making the ointment.

While I do not intend that such an ointment should be kept that long, I know from my experiments that it will keep perfectly for two years at least.

AS TO THE FUTURE.

Of course, at present such an ointment could not be dispensed as U. S. P. without the consent of the physicians. Most physicians will be open to such a suggestion when you tell them it is as quickly absorbed as lard, is cleaner, less liable to become rancid and is a more stable product in every way. I hope the demand will be such that it will eventually displace the present U. S. P. formula. Perhaps the demand for a hydrogenated fat suitable for pharmacy will cause manufacturers of such products to take notice of our wants and make one suitable to our needs. When they do, I predict an extensive future for such a product. We can use it to replace lard in all our ointments and thus eliminate some of our troubles.

Although I started to experiment with hydrogenated oils on an extensive scale two years ago, a change in positions has kept me so busy that I have not had time to continue the work since, consequently my experiments have been confined to only Zinc Oxide Ointment.

Acknowledgment is made to Parke, Davis & Company, in whose laboratories this work was conducted.

DETROIT COLLEGE OF PHARMACY,

April 19, 1918.

WHAT THE DRUG TRADE HAS DONE TO WIN THE WAR.*

The first paper of the symposium under above title and presented at the April meeting of the New York Branch, A. Ph. A. was by Mr. R. C. Stofer, who in his preliminary remarks referred to some of the orders that their firm had completed. He also stated that, in his opinion, pharmacy should disregard its characteristic modesty and take due credit for its achievements, many of which are the result of the marked degree of coöperation at present existing, by reason of the fluxing process which is going on between educators in pharmacy, retail pharmacists, and the excellently equipped scientific and research laboratories of progressive pharmaceutical manufacturers. Parts of his paper follow:

Digitalis: Through the intelligent direction of its collection and preparation for the market, American growers have succeeded in supplying digitalis much superior to the European article. We have received American-grown digitalis, which tested nearly two and a half times the U. S. P. standard. Experiments have been conducted in the scientific department with a view of determining the best physiological method for the estimation of the strength of digitalis preparations. Comparative tests are now being made by the one-hour frog method, the twelve-hour frog method, the cat method of Dr. Hatcher, and also the guineapig method. It is hoped from the results of these experiments a definite, scientific conclusion may be drawn as to which is the best method for testing digitalis and its preparations.

Mexican Scammony: Owing to the world war, true scammony became unobtainable in commercial quantities. Experiments, both chemical and physiological, have been made with the resin obtained from true scammony and that from the Mexican scammony. From the results of experimental work, data is now in the hands of the U. S. P. Revision Committee and they have been requested to permit the use of Mexican scammony as a source of resin scammony, as is done at the present time by the British Pharmacopoeia.

Aconite: It has been definitely shown by many investigators, that the present chemical method for the assay of aconite and its preparations is entirely unsatisfactory, as the results obtained do not indicate the therapeutic activity of the drug and its preparations. Experiments are being made, looking to the isolation of aconitine from benz-aconine and aconine, as it is claimed that these two alkaloids are not therapeutically active, to any great extent. Much research work is being performed upon the physiological method, in an endeavor to improve the new semi-official guineapig method of the Pharmacopoeia.

Belladonna Leaves: The leaves of Hungarian and German growth which we formerly received were oftentimes brown, of low assay, probably due to improper collection and preparation for the market. Much attention has been given in various sections of the United States to the cultivation, upon a commercial scale, of belladonna, and the American growers have been quick to grasp the advantage of high assay. By efficient methods, proper selection of seeds

* A symposium of the New York Branch, American Pharmaceutical Association, April meeting, 1918. Abstracts from papers by R. C. Stofer of Norwich Pharmacal Company; Saunders Norvell of McKesson & Robbins; H. C. Lovis of Seabury and Johnson, and S. B. Penick of S. B. Penick & Co.

from high assay plants, etc., there has been produced in this country belladonna assaying as high as 0.8 percent, or nearly three times the assay of the average European leaves. We now, by preference, purchase American-grown leaves as against even the good quality cultivated French leaves which reach the country in goodly quantities.

Hyoscyamus: Before the war, Russia was the principal source of supply, but the drug was notorious for its low assay and its generally poor physical condition, and it was practically impossible to obtain an article complying with the Pharmacopoeial requirements, except for occasional small lots of cultivated drug, which came over from England or Germany. America is making slow progress with the production of hyoscyamus, as successful cultivation is conceded to be difficult, however, Michigan, Maryland and Virginia produced limited quantities of this drug last year, which assayed about three times the U. S. P. standard. Therefore, we are confident that in time the American drug will be available in greater abundance.

The scarcity of belladonna and hyoscyamus led to many experiments with such combinations as pills and tablets, wherein stramonium was used in place of belladonna. As a result of clinical investigation, it was demonstrated that in many cases stramonium was entirely satisfactory to the medical profession and we have therefore been able to continue supplying such combinations as were in urgent demand with the full approval of the medical profession. By the way, stramonium grows abundantly in many sections of the country, but prior to the war, was collected only in a limited way. The cheaper labor abroad made it more profitable to import supplies from Europe, than to purchase here. Now, however, the collection in this country is enormous and we are entirely independent of outside sources. Generally speaking, American stramonium, though not cultivated, is of higher assay than the European article.

Cannabis: The U. S. P. IX recognizes American-grown cannabis, in addition to the Indian variety. This recognition has given a tremendous impetus to the growth and sale of American cannabis. Comparative tests demonstrate that the therapeutic action of the two varieties is similar, although, as a general rule, the Indian cannabis is considerably stronger than the American. This comparative difference in strength, however, can be well regulated by a proper consideration of dosage. The Pharmacopoeia requires that cannabis be standardized by determining the amount of drug sufficient to produce incoordination when administered to dogs, and by this test it is possible to select *Cannabis sativa*, which produced the desired clinical results; although as investigators, we realize that there is usually a difference in strength between the American and the Indian-grown drug. Under present-day conditions, it is practically impossible to secure sufficient quantities of the Indian variety to meet the demand, though, thanks to American initiative, the proper collection of the native drug again enables us to proclaim our independence. The biological assay of cannabis has, in all probability been more severely criticized than any other test in the Pharmacopoeia. The basic principle of test is fundamentally correct. With some slight modification, it will eventually be made more satisfactory. An investigation of the method has been under way for about six months and as this subject is in the hands of exceptionally capable men, we may expect satisfactory results at an early date.

Styrax: Before the war, all the styrax of the U. S. P. was imported into this country. The closing of this source of supply caused us to endeavor to find a product which would be similar in action. We are now in possession of an American styrax which, experiments indicate, is in every way as satisfactory as the European article, and, in the near future, this information will be compiled and placed in the hands of the U. S. P. Revision Committee. This is another triumph for American resourcefulness.

Pituitary Extract: After several years of almost constant experimental work, we have been able to assemble an apparatus which will physiologically estimate the strength of pituitary preparations within very narrow limits. The method employed is a modification of the isolated uterus method. Preparations so standardized have been exhaustively tested in maternity hospitals, and, we are pleased to say, it is now possible to produce a pituitary extract and standardize it, with the assurance that it will meet all demands.

Pepsin and Pancreatin: Experiments are being conducted to ascertain, if possible, the rate of deterioration that takes place in pepsin and pancreatin combinations. This work must necessarily be conducted over a considerable period of time, and it will probably be four or five years before any definite results will be in evidence.

Tincture of Ginger: The result of many experiments reveals that there is considerable difficulty in meeting the standards, as laid down in the U. S. P. IX. The results of the investigation have now been turned over to the chairman of the Revision Committee, who has charge of this and kindred subjects, and it is hoped that slight changes will be promulgated, which will permit of the manufacture without the difficulties that previously attended.

Mr. Stofer concluded his remarks by referring to various methods of conservation in sugar, glycerin, fats, etc. He also stated that many tablet formulas had been revised, particularly those containing narcotics, by the elimination of the latter in many of them.

Mr. Saunders Norvell modestly carried the credit of the work represented by his firm to the wholesale drug trade in general. He spoke of the many difficulties in securing supplies, labor shortage, and the series of taxation measures with which the wholesale drug trade had to contend. Notwithstanding the many difficulties, supplies have gone forward without serious delays and the drug trade has not been charged with profiteering. The Government has bought its drug and chemical supplies for less money than the trade; contrary to the story of the cartoon, depicting the hotel manager who said to the chef, "you cut down your portions 50 percent and we will raise the prices 50 percent—the war must be won." Mr. Norvell laid stress on the fine coöperative spirit of employees with the members of firms, not only in getting out orders, but in buying bonds and contributing to Red Cross, etc. He interestingly told the story of an order for 20 million 3-grain quinine tablets, which was then in the process of manufacture. Relative to this he said in part:

This is the largest single order for quinine ever placed in the history of this country. To fill this order will require 125,000 ounces of quinine—7,812 pounds, almost four tons. Piled on top of each other the 20,000,000 tablets would be 416,666 feet high—over 78 miles. Laid alongside of each other, they would reach from New York to the outskirts of Philadelphia; from Chicago to Milwaukee, or from Washington, D. C., almost to Richmond, Va.

To obtain the 60,000,000 grains of quinine contained in the tablets, approximately 108,000 pounds, 54 tons of cinchona bark will be used, each ton of bark it is estimated yielding about an average of 7 percent of quinine.

Figuring each cinchona tree as supplying an average of 200 pounds of bark, the 60,000,000 grains of quinine will be the product of 561 cinchona trees. As each tree furnishes suitable bark for producing quinine but once in an average of one and a half years, it has required 561 years of growth to produce the 60,000,000 grains of quinine.

To collect the bark, cure it, and transport it from the tropical forests engaged the work of thousands of natives for several months.

Several other illustrations of the present-day activities were reported. In concluding Mr. Norvell said: "This war is different from all other wars the world has ever known. It is a war of trained men. It is a war of organization. The soldiers in this war can accomplish nothing without the backing of the trained workers in every field at home."

Dr. Henry C. Lovis spoke of the participation in war activities of the surgical supply houses and the preliminary arrangements preparatory to supplying the Government needs. Fortunately the manufacturers in these lines had enlarged their factories in order to meet the orders of foreign countries prior to the entry of the United States into the world conflict. In connection with these immense orders the usual demand must also be considered. The following abstract of the paper is illustrative:

The first list of goods to be supplied included bandages of all sizes; absorbent cotton; first-aid packages; shell wound dressings; bichloride gauze; adhesive plaster; ligatures of all kinds.

The gauze packages consumed 110-million yards of gauze. It was necessary to secure the assistance of spinning and weaving mills, outside of the group of straight surgical dressings manufacturers to supply this immense yardage. Since the beginning of these requisitions up to the present time there has been a total of 386,000,000 yards of gauze contracted for. That has required day and night work of 30 different weaving mills. The yards of gauze equal 219,000 miles in length and one yard width and that means, taking the distance from New York to San Francisco in round figures as about 3000 miles, one continuous stretch of gauze from New York to San Francisco, back and forth, 70 times. To manufacture that quantity of gauze, just the gauze alone, would require 77,000 bales of cotton. Each bale weighing 500 lbs., this would mean 38,500,000 pounds of crude cotton requiring quite a respectable size plantation to produce it. There were 450,000 gross gauze bandages, compressed, ordered, which were $2\frac{1}{2}$ ", 3" and $3\frac{1}{2}$ " wide and 6-yds. long; 6,400,000 first aid packets put up in metal boxes enamelled in khaki color to match the soldiers' uniform; two of these go in a belt which each soldier carries; and in addition, two rubber-sheeting covered first-aid packets also go in his belt. Of those, there were ten million ordered. There were 34,000,000 yards Corrosive Sublimate Gauze, 1-yd. packages. One million and a half spools adhesive plaster, 1" x 5-yd., and one half-million $2\frac{1}{2}$ " x 5-yds., 1,400,000 shell wound dressings.

Details of other manufactures were given and Doctor Lovis closed his paper with a reference to the loyalty of those engaged in this line of manufacture.

Mr. S. B. Penick spoke of former sources of crude drugs from which supplies are no longer available. Some of these drugs are now obtained in this country, belladonna, digitalis, cannabis, hyoscyamus, stramonium, etc. The high cost of labor continues to be a problem but under present conditions supply is of first importance. Japan is furnishing valerian, chamomiles, hellebore and insect flowers while Italy, France and England are now supplying a number of botanicals heretofore procured from Central Europe. Nux vomica, rhubarb, senna, aloes and other drugs of the East have been difficult to obtain. The speaker alluded to the improved quality of drugs, due to Government supervision, and concluded with a compliment to those of the trade, who have coöperated in furnishing the Government and manufacturers with crude drugs. (See also paper by S. B. Penick, August issue, 1917, p. 695.)

CENTRAL INFORMATION BUREAU CONCERNING NATION'S HOSPITALS.

Dr. Franklin Martin, member of the advisory commission and chairman of the general medical board of the Council of National Defense, authorizes the following:

Information regarding the hospitals of the United States, in process of compilation since 1916, is now collated and indexed in the medical section of the Council of National Defense. A central bureau of information concerning the hospital facilities of the country, under war conditions, is thus provided. The data will be kept up to date from month to month. This bureau has not only the details of over 1,000 active hospitals but is also gathering full data concerning nearly 8,000 other institutions which include sanatoria, infirmaries, homes, asylums and dispensaries.

What each hospital has contributed in the way of medical men and internes for war service has been entered on the cards. The number of nurses who have volunteered and those remaining, the possibilities of expansion for war service, the results of personal inspection by State boards will constitute valuable active working data.—*Official Bulletin*.

SECTION OF HISTORICAL PHARMACY AMERICAN PHARMACEUTICAL ASSOCIATION.

MINUTES.

Chairman W. L. DuBois, of the Section on Historical Pharmacy, called the meeting to order in Claypool Hotel, Indianapolis, Ind., at 9.30 A.M. August 31, 1917. The first order of business was the reading of the chairman's address.

ADDRESS OF THE CHAIRMAN.

It has been said that Americans are not yet sufficiently imbued with the value and lessons of history and tradition. It is one of the tasks of this Section to create more and favorable sentiment among pharmacists for the preservation of whatever will give to our posterity a true historical picture of our present and past time, including its activities, aims, and achievements. I am certain that this Section will not let any opportunity pass for helpful service to the Association and to American Pharmacy.

History is interesting to look back upon, and it is pleasant to remember all those great and good men who have passed to the great beyond, who have done so much for pharmacy, especially those who were with us at our last meeting. I am afraid we do not fully realize the very great importance of doing our bit to carry on this work.

It would be an easy thing for our members from time to time to send in to the Historian matters of historical interest. As a matter of interest to coming generations, I would recommend that all members send to the Historian sketches of themselves and their impressions with their photograph.

I wrote several letters during the winter, and was very successful in finding those who kindly consented to prepare papers for this meeting, they all treat of interesting subjects, and I can promise you a program worthy of your close attention.

W. L. DuBois, *Chairman.*

CASWELL A. MAYO: I move that the paper which the Chairman has just read take the usual course.

(Motion seconded and carried.)

THE CHAIRMAN: The next order of business is the report of the Historian.

REPORT OF THE HISTORIAN OF THE AMERICAN PHARMACEUTICAL ASSOCIATION.

The Editor of the Journal of the American Pharmaceutical Association is also Historian, the curator of contributions to this Section. It was through the hearty coöperation of the Treasurer that many of the photographs reported hereafter were received. It has been provided that every member of the Association be requested to send his or her photograph to the Historian, accompanied by a brief sketch of the life of the contributor. This provision has a growing value and it is hoped that all members who have not complied with the request do so as soon as possible. The data especially desirable are the events of every life, and also such other information of the correspondent's professional and business activity that should be made a matter of record.

Frederick T. Gordon who was associated with this Section in various capacities passed away this year. He had in his care a number of contributions that had been made to the Section, and Mrs. Gordon has turned these over to the Historian, among these is an interesting album presented several years ago by our fellow-member, Hugo Kantrowitz, editor of the *Deutsch-Amerikanische Apotheker Zeitung*, New York. There are a number of contributions, that have in years past been made, which your Historian has not been able to locate.

Last year the writer made the suggestion that an historical exhibit be provided at each annual meeting by the hosts; this has been adopted by Indianapolis members and will doubtless prove of interest not only to the visitors but also to the pharmacists of Indianapolis. Research

work and the collection of historical matter always brings up the thought of a home. The time may not be opportune just now, but we should bear the important matter in mind. We have ample accommodation for the present for historical matter that may come in.

This is the centenary year of the beginning of the United States Pharmacopoeia and in the Journal of the American Pharmaceutical Association for August a record of the event is made.

Since we met in Atlantic City, as far as we have received information, the following have been claimed by death:

David Strauss, Newark, N. J.
Theodore G. E. Otto, Columbus, Ind.
Conrad Schadt, Amana, Ia.
George C. Bartells, Camp Point, Ill.
Linus D. Drury, Roxbury, Mass.
Edwin P. Burleigh, Boston, Mass.
Robert H. Land, Augusta, Ga.
M. I. Wilbert, Washington, D. C.
G. M. Sutherland, Alameda, Cal.
A. J. Lachapelle, Turners Falls, Mass.
E. S. McKee, Cincinnati, Ohio.
J. F. Llewellyn, Mexico, Mo.
William C. Alpers, Cleveland, Ohio.
Cyrus J. Lammert, Cincinnati, Ohio.
Joseph Feil, Cleveland, Ohio.
N. Gray Bartlett, Chicago, Ill.
A. D. Thompson, Minneapolis, Minn.

Robert W. White, Philadelphia, Pa.
B. S. Cooban, Chicago, Ill.
C. Lewis Diehl, Louisville, Ky.
F. E. Farmer, Rutland, Vt.
Bower T. Whitehead, Brookings, S. D.
John C. Hurd, Somersworth, N. H.
George A. Ferguson, New York City.
Thomas F. Main, New York City.
Albert F. Stiefel, Pittsburgh, Pa.
Joseph Weinstein, New York City.
Frederick T. Gordon, Philadelphia, Pa.
J. F. Pearson, Annapolis, Md.
Alois von Isakovics, Monticello, N. Y.
George V. Moschel, Spring Valley, Ill.
J. O. Schlotterbeck, Ann Arbor, Mich.
Frederico Grimany, Santiago de Cuba, Cuba.
D. Kirkland, Los Angeles, Cal.

Thirty-four in number, about twelve per thousand of our membership; four of the deceased were members of the U. S. P. Revision Committee; two had been presidents of the American Pharmaceutical Association and one, an Honorary President, two had been Chairmen of this Section. Death has also entered the homes of a number of our members.

The present is our field of duty but we should hold those who added benefits to our Association and joy to our lives in affectionate remembrance.

Respectfully submitted,

E. G. EBERLE, *Historian*.

Henry A. Johnston, Francis P. Morgan, Murray G. Motter, Fred T. Hafelfinger; Lists of lady pharmacists in Arkansas, Illinois and Indian Territory.

THE CHAIRMAN: Gentlemen, you have heard the Historian's report. What is your pleasure?

H. M. WHEPLEY: I move that it be received and take the usual course.

(Motion seconded and carried.)

THE CHAIRMAN: The next report is that of the Indianapolis Historical Exhibit.

REPORT ON THE INDIANAPOLIS HISTORICAL EXHIBIT.

(Verbal Report by Chairman E. G. Eberhardt.)

Mr. Chairman: I have no formal report to make. As a matter of fact, I did not know that a report was expected until I saw the program. While we met with some success in getting together a few relics, we did not realize how difficult it was going to be to collect exhibits that would, at least in some degree, represent historical Indiana pharmacy.

In the first place, we are making contemporaneous history at such a rate that it is very difficult to get people interested in things of the past, and while we had some responses to our inquiries, it was very difficult to get prospective contributors to realize what we wanted. I have had men say to me, "If I only knew what you wanted, I could have helped you out. I have such and such things at home." We tried to make it plain to them by correspondence, but they did not seem to get the idea.

Then we met another condition: People, as a rule, do not realize the value of historical matter, and the junkman gets a great deal of what ought to be preserved for its historical value. We found that much of the material which would be of great interest in an exhibit of this kind, has gone, and gone forever. The junk and gentleman vandals are the worst enemies that we have. I think this is the very thing that this Association has an opportunity to accomplish a great work in, and that is to make our members understand that an historical exhibit is of much live, educational value, to impress the members that some of the old things they throw away are worth preserving.

The exhibit will have to speak for itself. We have material from outside of this city, but most of it is from local druggists. It goes back forty or fifty years, some of it sixty or seventy-five, and a few of the items were brought over from Germany by some old-time members.

I am sorry we did not succeed in securing all the material we hoped to get. For instance, we expected some material from Browning, Sloan & Co. It was inaccessible, as the family's belongings are stored. However, we have obtained a few things, among them Parrish's Pharmacy, the Fourth Edition. I had hoped to get a picture of Mr. George Sloan, but was unsuccessful.

If your Historian sees any article that he would like to have for the permanent collection, of this exhibit, we shall be very glad to put him in touch with the owners of the same, and I think probably such material would be donated or loaned. I believe such a local exhibit as this can be used as the means of selecting material for a National Pharmaceutical Exhibit.

I want to thank all of those, on behalf of the Committee, who have contributed to the exhibit.

THE CHAIRMAN: You have heard the report of Mr. Eberhardt.

CASWELL A. MAYO: I move that the report be accepted, and that the thanks of the members be extended to the Committee for the trouble they have taken in making the collection.

(Motion seconded and carried.)

EDITOR EBERLE: We would like to have whatever the exhibitors are willing to donate. It is contemplated to provide a room or space in the Smithsonian Institute in Washington, where historical matter will be properly taken care of.

EDWARD KREMERS: Those of you who will recall the organizing of this Section back in 1902, will understand what pleasure I took in working out this

matter, and in connection with the work being done in this Section. It is indeed exceedingly gratifying to see this exhibit, modest as it is, in comparison with the exhibit in 1902, or even last year, yet its significance is such that we should not pass it without a word.

Mr. Eberhardt has said that no doubt some articles exhibited might be turned over to the American Pharmaceutical Association for a permanent collection. I trust this may be done. On the other hand, it might be well for the American Pharmaceutical Association not to overload its exhibit. It may be better to keep part of that exhibit right in Indiana. While I appreciate the museum at Washington, I also appreciate the missionary work which the local exhibits can perform, without detracting from the National Exhibit, which should be our first aim.

EDITOR EBERLE: If the Section so concurs, I would like to have the Historian instructed to ask the members at Chicago to provide an historical exhibit for the 1918 meeting. I do not know whether a motion is necessary or not.

H. M. WHELPLEY: I had two or three things in mind, part of which Mr. Eberle presented, and another person presented another part of them. I have particularly in mind that the Chairman of this Committee should submit to this Section a list of the articles exhibited, and the names of those who have contributed these articles for the Exhibit.

I particularly endorse the recommendation, and I think it should go forward from this Section, that the Committee for the Chicago meeting should continue this plan of having a local exhibit.

In regard to the disposition of this Exhibit, Dr. Kremers has made the point very clear, and the only word I want to add to it is this, that we should be careful that any exhibit in the collection that is deposited in the Smithsonian Institution, temporarily, should not include any of those things that are of local interest.

As an example of what I mean, you have much here that pertains to Indianapolis, or pertains particularly to Indiana, without being of any particular significance beyond the borders of this State. A mortar or a picture, or something of that kind from the store of Ex-President Sloan of the American Pharmaceutical Association, and one of the prominent men in American pharmacy, would be very appropriate for this National Museum. It might also be well to deposit with the American Pharmaceutical Exhibit some things that are duplicates, even though they are not of a National character. They might be held so that later on they could be placed where they would be of permanent interest.

I am certainly pleased to see how the historic interest has developed and grown in pharmacy. I know what some men like Doctor Kremers have done, and remember when he spoke very discouragingly about the matter some years ago, and now it must be gratifying to him to see that his own work is bringing results.

F. E. STEWART: I received a letter from the Massachusetts Agricultural College, Extension Service, signed by Mr. Wayne Arny, that I would like to present as a matter of historic interest.

(Mr. Stewart read the letter from Mr. Arny.)

CASWELL A. MAYO: I move that the letter be referred to the Council for consideration in connection with the plans of the Exhibit. (See December 1917 JOURNAL A. PH. A., p. 1098.)

A paper, "The Development of Manufacturing Pharmacy" was presented by Mr. J. K. Lilly and brought out considerable discussion and comment. Professor Lloyd indicated in his remarks that Mr. Lilly might be willing to donate a picture of the original Lilly Laboratory to the Section. He had in his possession some apparatus used by Dr. John King and two suppository molds used by Dr. W. D. Chapman and, if a permanent exhibit was provided he would present these to the collection. (The paper by Mr. Lilly is printed in this issue of the JOURNAL.)

J. N. HURTY: We solicited Mr. Charles Dennis, an old-time druggist for a contribution. He said he was never a pharmacist, but at one time he thought he was a part of an apothecary. He has become a very eminent writer. He has written no book, but he has become very prominent as a writer in newspapers of this section. He has been contributing articles that are full of wit and wisdom. He was requested to give us some reminiscences in regard to early pharmacy in this State, and he addresses this letter to Mr. Eberhardt.

INDIANAPOLIS, IND., August 7, 1917.

MR. E. G. EBERHARDT:

Some weeks ago my long-time friend, Dr. John N. Hurty—alas, that even those in whom one most confides should be the first to take advantage of one's feeble resistance and impale one on the sharp hook of a promise—asked me to write something concerning the early years of pharmacy in Indianapolis.

Fifty-five years ago when first I entered the drug trade as a soda-water boy and general roustabout, there were more farmers than pharmacists in Indiana. The only pharmacist in this city in the sixties was Dr. George W. Sloan, who was not at all puffed up by this distinction, but then and always after was the most genial and kindly gentleman of all my acquaintances, a true friend and a man of wide information which he could communicate most happily without his auditor being distressed by lack of knowledge.

Along in the sixties there was not, as my remembrance goes, a single sign proclaiming a pharmacy in this modest little city. I believe there were only thirteen—fateful number—drug stores and of these only two dared venture on the title "apothecary." These were conducted by Germans and in Teutonic script on the show window they blazoned to the world the word "Apotheker."

In the sixties and far into the seventies the pharmacist, as I said, was next to unknown. We were not then the physician's "cook" but merely druggists and dealers in "paints, oils, varnishes, dye-stuffs, window glass, perfumery, fancy goods, patent medicines, chemicals, glass-ware, putty, brushes, spices, cigars, tobacco"—and although we did not mention it above a whisper—all kinds of vinous and spirituous liquors. In that day the druggist did not sell candy—except as an evasion for vermifuge calculated to deceive innocent childhood—no postage stamps, nor did he take in washings—all this came later.

In that day the child of pious parents might be trusted with some pieces of copper coin for the missionary box on a Sunday morning as there was no candy counter in the drug store—now the pharmacy—to divert the contribution from the pagan to the 'pothecary. The old-fashioned drug store had but two articles in its inventory to beguile the sweet toothed youth of that time; one of these was *radix glycyrrhiza*, liquorice root and the other was jujube paste.

The druggists and his skillful assistants in the course of a single day played many parts. The same hands and the same smile that had just weighed out fifteen pounds of yellow ocher, ten pounds of Venetian red and measured five gallons of linseed oil, boiled or raw, would wait upon the fashionable lady whose favorite odor was Patchouli, which she bought at \$3 an ounce, Lubin's extract, for this was in the days of the civil war when our currency was worth but little more than 33 cents of a dollar on a gold basis.

There was not then nor for long afterward a school of pharmacy in Indiana, but the proprietor, or perhaps the head clerk, was not to permit the cub to remain in ignorance of the history of the roots and herbs that he handled. This was before the manufacturing pharmacist had taken away all the rudiments of the business and furnished everything ready-made and sugar coated. The cub was then required to take out the iron mortar and with blows that could do credit "to days of old when knights were bold," smash black cohosh, blood root or any other character nominated in the *materia medica* to diminutive smithereens. The blood root was one especially fine to the nostril of the young acolyte.

On a winter's evening the cub, when trade would flag, would be set to read *Parrish's Pharmacy* or in what he came to believe the compendium of all knowledge—the *United States Dispensatory*. If the cub should be a laggard in going to his duty, there was something else in store for him. He could spend that winter evening in putting up essence of peppermint and cinnamon, in making and boxing seidlitz powders or getting up a supply of castor oil, Bateman's drops and Godfrey's cordial—which by many years had anticipated the "soothing syrup for children." The drug cub of that day, as it recurs to my remembrance had fewer evenings off than now. The idea appeared to pervade the elderly drug mind that holidays should be few and the working hours should be long. There were no motion picture shows, no short skirted vaudeville and there was a narrow chance that the cub should be able to attend the annual circus.

Yet, I cannot but believe even with these handicaps, the cub of the war-years of 1861-65 was favored with a knowledge of current affairs above the boy of today's pharmacy. The gossip of the little city as there were no clubs or club rooms in that day met at the drug store and around the wood-fires that crackled in the stove. There were many discussions of various themes—the war politics, and religion to which with eager ears the boy listened—and fireside tales told by doctors, lawyers, and other "leading citizens," who had leisure to be better talkers than we have today and spared no detail to render a narrative interesting.

Perhaps—though I do not insist upon this—the drug cub of that day had an originality in mischievous invention of which the pharmacist boy is untainted or immune—I remember a team of two cubs in a Washington street drug store who were the authors of a sensation that was for some days a cause of much alarm. It was given half a column in the newspapers of that day and there were many nervous persons who for several days evaded the south side of Washington street between Pennsylvania and Meridian streets, particularly that part fronting the New York Store.

These young artists had possessed themselves of a couple of long glass tubes and from a second story window at intervals during the day they would fire pellets of putty at unsuspecting passers-by. Their aim was so accurate and their windpower so strong that it was no trouble at all for them to hit a good-sized neck above the collar at a distance of two hundred feet or more. They were never detected and these attacks were laid to some anonymous marksman who was armed with an air gun, all the more dangerous in that it made no noise when discharged. It was lucky for the cubs that this was so. Their discharge had they been detected would have made considerable noise and perhaps have met with the attention of the criminal court.

A drug cub of my acquaintance who was, indeed, for a time in my employ, but was permitted without serious remonstrance on my part to sever his connection, was a past master of mischief. One day a young fellow from the country entered the store and with a furtive glance at the surroundings selected the cub with the feeling that that young personage would not be suspicious as to his purpose asked the cub for a Spanish fly. The cub disappeared for a moment and returned from the backyard with a buzzing blue-bottle fly in a one-ounce vial—"ten cents" said the cub.

"Why," said the country yokel, "I did not know they were alive."

"Yep," said the cub, "we only have 'em alive, that's the only kind that'll do the business."

On another occasion a woman in the neighborhood, a good customer, brought her two small boys into the store and turning the lads around so they faced backwards, said, "see what your boy has done?"

The cub had poured a thin trail of sulphuric acid on some boxes whereon the boys of the neighborhood were wont to congregate and the woman said this had eaten out the seat of the youngsters' trousers, for which prank the proprietor was called upon to pay damages.

I have quite serious doubts as to any benefit that may come from this recital of ancient reminiscence, but I have been so long out of touch with the trade—which is now a profession—that any effort in which the people of today might be interested can scarce be anything but a failure.

(Signed) CHARLES DENNIS.

J. N. HURTY: There is a little town in Indiana called Gassport, where resides an old character, Dr. Wooden. He is eighty-six years old. He has been in the drug business over sixty years, and he has written us a letter which I will read to you.

GASSPORT, IND., August 14, 1917.

E. G. EBERHARDT:

In reply to circular letter of this date, I commenced practicing medicine at this place in the spring of 1851, 66 years ago. I graduated from the Indiana Central Medical College, Indianapolis, Ind. When I commenced practice here we had no railroads, telegraph, telephones, pike roads, microbes and appendicitis, but we had plenty of horse-flies and mosquitoes along White River. I was my own pharmacist, manufactured all of my tinctures by the old process of 14 days' maceration and then filtering. I also manufactured all the cathartic and ague pills. I got to be an expert in making pills; could roll two at a time with my hands.

That was pharmacy—early pharmacy in this part of Indiana. What a change now! However the physicians of back in the 40's and 50's were just as much up-to-date as the physicians are to-day, considering their environment. It is true that the thumb lance and large doses of calomel have been relegated to the rear, and 50 years from now the hypodermic syringe and sugar-coated tablet will follow along with the lancet and calomel. What then will be the practice? I apprehend almost all nervous diseases will be treated mentally, without the use of nauseating remedies. The science of medicine will still progress. Pharmacy will still progress. But don't arrogate to yourselves that you know about all that is connected with pharmacy now.

Yours respectfully,

(Signed) JERRY WOODEN.

Dr. J. N. Hurty then read a paper in which he entertainingly and interestingly reported some of his Drug Store Recollections. (We hope to print this paper in a later issue of the JOURNAL.)

The next number of the program was a paper by Caswell A. Mayo on "Antique Mortars," illustrated by lantern slides. The illustrated article was published in the *American Druggist* and also in the *Alumni Journal* of the New York College of Pharmacy, July 1917. The exhibiton of these mortars was held at the College and included the Fraser, Pfungst and Morgan collections, among the latter a mortar belonging to Sig. Enrico Caruso. The lecture was arranged according to periods and also the sources of these mortars. The value of the mortars exhibited was estimated at about twenty-five thousand dollars.

The next paper was by Frank H. Carter and entitled "Historical Pharmacy of Indianapolis." Then followed one by Dr. Edward Kremers, "Lafitan's Memoir on Ginseng." (See May issue 1918, JOURNAL A. PH. A., p. 448.)

Edward A. Sayre presented a continuation of the history of the New Jersey Pharmaceutical Association, bringing his contributions to the close of 1916.

Hugo Kantrowitz next read a letter from Wilhelm Bodemann of Chicago relating to the Chicago Veteran Druggists' Association. (Printed May 1918, JOURNAL A. PH. A., p. 448.)

W. F. Gidley presented a history of Purdue University School of Pharmacy.

Francis Hemm summarized an interesting collection of historical material relating to Carl Ludewig Lips, an apothecary of St. Louis from the 50's to the

'70's. An English translation of the items was turned over to the Section. In brief, the papers are summarized as follows; the originals are in possession of the Alumni Association of the St. Louis College of Pharmacy:

1. The birth and baptismal record of Carl Ludewig Lips, an apothecary of St. Louis during the fifties and sixties and seventies.
2. His school certificate.
3. Proof of requisite preliminary education.
4. Certificate of apprenticeship.
5. Diploma.
6. The apothecary's oath taken by Lips.
7. Proof that Lips has taken the oath in this body.
8. Reports of two of Lips' pharmacy inspections.
9. Certificate of Lips' honorable discharge from military service.
10. Testimonials received by Lips from his several employers.

Dr. H. M. Whelpley presented reprints from Meyer Brothers' Druggist of reminiscences of Professor C. Lewis Diehl by his daughter. The personality of this lovable character is clearly shown. The article is printed in the publication mentioned for August 1917, pp. 250-251.

Following the reading of each paper the contributors were given a vote of thanks. The next order of business was the election and installation of officers for the ensuing year as follows: *Chairman*, L. E. Sayre of Kansas, and *Secretary*, Hugo Kantrowitz of New York. After extending a vote of thanks to the retiring officers the Section adjourned.

THE DEVELOPMENT OF MANUFACTURING PHARMACY IN INDIANA.*

BY J. K. LILLY.

Until the period following the close of the Civil War there were no manufacturing pharmaceutical establishments in the State of Indiana, such operations being limited to small laboratories in wholesale or retail drug houses. The house of Craighead & Browning, afterwards Browning & Sloan, located in Indianapolis, had a large wholesale and retail business and made a great many of their own preparations, but did not sell them to others. It is an interesting piece of history that as late as 1885 or 1886 the retail department of Browning & Sloan did a larger volume of business than any other concern in the United States. A force of twenty-five or thirty clerks were employed. A prescription counter about fifty feet in length literally swarmed with prescription clerks, and a very large portion of the dispensing of drugs for Central Indiana was handled by the store. A large building on Washington Street was occupied by a large stock of merchandise and nothing but drugs and immediately allied lines were handled. The synonym for the firm name of "Apothecaries Hall" was employed and appeared on all signs and printed matter. George W. Sloan, of this firm, was a life-long member of this Association and at one time its president.

The first laboratory for the manufacture of pharmaceutical preparations in Indiana was established by Mr. James E. Lilly at Evansville, Ind., in the year

* Read before the Section of Historical Pharmacy, A. Ph. A., Indianapolis meeting, 1917.

1870. The title of this firm was James E. Lilly & Company, the company being his father-in-law, Captain Dexter, a noted steamboat captain and owner of several boats running on the Ohio river. In 1872 Capt. Dexter's interests were purchased by a Mr. Phelan, the firm becoming Lilly & Phelan. Considerable progress was made by this concern during the few years of its existence and a catalogue on display in the historical exhibit of this meeting shows that considerable quantities of goods must have been shipped outside the confines of the State. In those days river traffic was very heavy and Evansville was favorably located for all Ohio and Mississippi River points, also their tributaries. Owing to financial speculations by the junior member of the firm of Lilly & Phelan, financial embarrassment overtook the concern and it went out of business in 1874. Mr. James E. Lilly then entered the employ of Wm. R. Warner & Company, of Philadelphia, but in 1878 became associated with his brother Eli at Indianapolis and has been continually associated with Eli Lilly & Company as partner and officer since that date.

About the year 1875 the firm of Buntin & Armstrong, of Terre Haute, began the manufacture of a line of pharmaceutical preparations consisting principally of elixirs and syrups, and secured a substantial volume of trade throughout Indiana and Illinois. Subsequently this line was abandoned by this concern upon its dissolution, W. H. Armstrong establishing a surgical instrument house and Mr. Buntin establishing the Buntin Drug Company, of Terre Haute, which is still in existence as a retail drug store.

In 1873 Eli Lilly, associated with Dr. John F. Johnston, established the firm of Johnston & Lilly at Indianapolis.

In response to a request by the committee of your Association, a brief synopsis of the life of Eli Lilly is given as follows:

He was born in Baltimore, Md., in 1838, the Lilly family having been established in and around Baltimore from a period antedating the Revolution. During infancy he removed with his parents to the Blue Grass region of Kentucky, first residing at Lexington and later upon a farm near the town of Warsaw, in Gallatin County. When still quite a small lad the family removed to Greencastle, Ind. This town remained the family home for many years. Along in the fifties young Eli paid a visit to his Uncle Caleb, at Lafayette, Ind. In those days Lafayette was looked upon as the coming metropolis of the West, being at the head of navigation of the Wabash and also on the thriving Wabash & Erie Canal. In wandering about the public square, taking in the sights of the city as country-town boys are wont to do, his attention was attracted to a large sign depicting the story of The Good Samaritan. This sign occupied a goodly portion of the front of a building over the door of the drug store of Henry Lawrence. Mr. Lawrence was a highly educated English apothecary and enjoyed the confidence and patronage of a large following of physicians and the laity. He called his store "The Good Samaritan Drug Store." This caught the youthful fancy of Eli, and upon returning to the office of his uncle he solicited his assistance in securing a job in that Good Samaritan Drug Store. This was very fortunately accomplished and Eli immediately entered the employ of Mr. Lawrence as an apprentice on the old English plan of pharmaceutical apprenticeship. It was a thorough school and Eli succeeded in winning the approval of his preceptor.

Many are the interesting stories told of pharmaceutical manipulations of those early days in The Good Samaritan Drug Store—the manufacture of pills by hand in large quantities, the powdering of gamboge and other noxious substances in iron mortars, with one's respiratory organs protected by wet cloths, the daily study hour, the hour of recitation before retiring, the early hours of opening, building the fire on cold mornings, will all be familiar to those informed on early pharmaceutical training. In due course Mr. Lawrence announced that Eli was competent to conduct his own store. He thereupon returned to Greencastle and after a brief clerkship his father assisted him in establishing a store in which he was just beginning to make some progress when the Civil War began in 1861. Having always possessed a love for military affairs, he immediately volunteered for service, literally locking his front door and leaving for the front. He served his country continuously throughout the war, first as Lieutenant in an Infantry Company on the three months' service, then Captain of Artillery for several years, in which he took part in Chickamauga, Hoover's Gap, Mossy Creek and other important battles. Later he entered the Cavalry service and was mustered out as Colonel of the 9th Indiana Cavalry.
